a creature being hurled into life by an indiscriminate cosmic process, and yet at the same time endowed with a free will and capable of self-improvement. He sows acts and reaps their consequences, but he reaps consequences whose causes he has not sown. The whole doctrine is lop-sided. Of what use is it to talk about justice and to preach acts of justice when we regard man as the sport of chaotic forces? How can a man in whom is implanted the sense of justice and the desire to execute it be the product of a cosmic force which knows no justice?

We only get a coherent picture by accepting the principle that birth is *not* the beginning of life, but merely the entry of an immortal Soul upon one—another—stage of its career. Only thus can we avoid the untenable idea that any consequences can be "casual" or uncaused. Every effect must have had a cause. The man was born at a certain time and amid certain circumstances because he himself, in a previous existence, set in motion the causes that brought about that result. Even so is each one of us now sowing causes which will lead to future weal or woe, and determine the circumstances of his next birth.

The teachings of Karma and Reincarnation are lost links in the chain of our philosophy, and are sadly needed to supplement and rationalize the beneficent impulses that we feel. And unless people in general awaken to a knowledge of these essential truths, we shall never be able to find the machinery with which to carry out our beneficent wishes towards the criminals. The blind cannot lead the blind, and he who would lift another out of a bog must have his feet on firm ground. STUDENT

What is Palmed Off as Theosophy

THEOSOPHY, like other great movements, has had to encounter two kinds of opposition. The first kind comes from those who oppose it altogether, and the second from those who offer spurious goods

in its name. But it is slowly and surely overcoming both these kinds of opposition and will eventually outlive them both.

Those who offer curious goods in its name do but keep the public away from a knowledge of genuine Theosophy and bring the name of Theosophy into disrepute. Eventually the public will awaken to the fact that there

is this distinction between the genuine and the imitation, and will learn to distinguish them.

The imitations of Theosophy are mainly of two kinds: the directly pernicious and the merely drivelling. The former kind teach various "psychic practices" tending to overthrow the mental and physical balance; the latter merely pour forth so much twaddle. As an instance of the latter, one notices in a daily paper a review of a book entitled *The Way of Initiation*. This work, as one gathers from the review, is a striking example of the kind of thing which *soi-disant* Theosophists are reduced to, and is a sad commentary on the manner in which the name of Theosophy is travestied.

The way of discipleship is marked by three stages, Probation, Enlightenment, Initiation. A young gentleman anxious to set the world on fire as a theosophist is first taught to cultivate "the emotional and mental life." Our young gentleman does this by fixing his thoughts on "the germinating, expanding, and flourishing of life on the one hand, and, on the other hand, all things which are connected with fading, decaying, and dying out." If he does this efficiently, he will notice "a new kind of thoughts and feelings, unknown before, uprising in the soul"; and the more he fixes his thoughts alternately upon "something growing, expanding, and flourishing, and upon something else that is fading and decaying, the more vivid will these feelings become"; they are described as being the one "remotely allied to the sensation of a sunrise," and the other "comparable in the same way to the gradual uprising of the moon." In this way, and with these rewards, the interesting and now thoroughly excited disciple "cultivates the emotional and mental life." He is getting on when he sees the moon rise in broad daylight.—*London Daily Chronicle*

Readers are spared further specimens of it. The profane sceptical critic can be left to dispose of this kind of "Theosophy," which is not likely to survive his attacks. The only thing that gives such fatuity any vitality at all is the fact that there is a genuine Theosophy—the kind originally taught by H. P. Blavatsky, the Founder of the Theosophical Society; and inquirers interested in it are invited to apply to the Theosophical Publishing Company of Point Loma, California. H. T. E.

THE THEOSOPHICAL ADDRESS AT ISIS THEATER

A MOST interesting paper was read at the meeting of the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY at Isis Theater last Sunday evening by Mr. Percy Leonard, on the subject "Christ and Theosophy."

The speaker drew many parallels between the teachings of Christ and those which during the last thirty years have become known as Theosophy, quoting the sayings of Jesus in support of the view that he was a Theosophist. For, said he, the Theosophical Movement is not a modern product but has been active in all ages and began with the first appearance of man upon this planet. Theosophy is the root from which all the great religions of the world have sprung. The religion of Jesus bears the same relation to Theosophy as the branch of a grape vine does to the stock from which it springs.

We have great difficulty however in knowing exactly what Jesus really did say, as it is notorious that many Christians in the early centuries had no scruple in touching up and making additions to the original manuscripts where they believed that such alterations would support their churches. And yet the record of his teachings, fragmentary though they were, warrant us in saying that the Galilean teacher taught Theosophy and was himself a member of that ancient and exalted Brotherhood of Helpers of Humanity who incarnate from age to age to light the path that leads to the upper day, to show superb examples of perfect human life, to institute reforms, and to assist (so far as the law permits) our suffering human race to bear that overwhelming load of ancient sin which humanity must carry until harmony has been restored.

The speaker contrasted the teaching of Jesus regarding the Father in heaven with those of the Old Testament, in which God is represented as a jealous vengeful Deity.

The UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY declares itself to be a part of a great and universal Movement that has been active in all ages; neither did Jesus claim any novelty for his message, for he likens his disciples to householders who bring forth out of their treasures things new and old. Did Jesus lay stress on the orthodox views of religion? The speaker thought not, and he instanced the story of the Good Samaritan. The priest and the Levite, unimpeachable in matters of faith, passed by on the other side; it was the heretical Samaritan that was neighbor to him who fell among thieves.

The Theosophical teachings of Karma and Reincarnation are to be plainly seen in the teachings of Christ, and the Brotherhood which he taught is the very core of Theosophy.

Katherine Tingley has declared it to be one of the duties of Theosophists to rescue the living Christ from the hands of those of Jesus' professed followers who have so disfigured and misrepresented that ideal as to alienate it from the affections of the masses of the people, who need such a spiritual stimulus. He is one of our elder brothers who has climbed to greater heights, and though now so greatly in advance of our present attainment, is still our brother man.

OBSERVER

The Serpent and the Devil

THE narratives in the first few chapters of *Genesis* are absurd and have justly excited ridicule, when taken literally. Few, even among the most ignorant, take those stories nowadays in their dead-letter sense. But it is equally wrong to reject them altogether as useless nonsense.

What Christians ought to know, and what their teachers ought to have told them, is that these stories are not peculiar to the Bible, but are virtually universal. Some higher critics are making a great fuss about having traced the Biblical narratives to Chaldaean sources; but this is really not worth troubling about, seeing that it is just as easy to trace the resemblances to Egyptian, Hindû, Scandinavian, or even ancient American sources. If the Biblical stories were traced farther back, they would be found to have come from India, whence they were brought by the races that settled in Mesopotamia, and where they are still largely to be found in the Hindû sacred books.¹ (For notes, see end of article.)

Nearly everywhere in the early cosmogonies of nations we find the symbolism of the Garden of Eden, the Serpent, and the Tree of Life. This is not the place for quotations, but they can easily be supplied. Brinton, in his *Myths of the New World*, gives a large number of instances of the Serpent and the Tree of Life among the ancient American tribes. In the Scandinavia mythology there is the tree Yggdrasil; among the Hindûs the Áśvattha Tree; among the Tibetans the Zampun; in the Kabala the Sephiroth Tree, and so on.²

But what concerns us at present is the Serpent. This is the world's favorite symbol for Wisdom and for Wise Men, but it has been perverted by theology into a symbol of the evil in man's nature. Theology has been responsible for identifying the Serpent in the Garden of Eden with a personification of the evil in Man's nature.³ But there is no connexion at all. The "Devil" is an invention of man and of theology and has no real existence,⁴ unless we regard him as the product of man's evil thoughts, in which case there must be innumerable Satans. By confounding the Serpent of Eden with this theological bugbear, the meaning of a beautiful allegory has been perverted. The Serpent in the Garden of Eden was a good power, one of the powers that created man. The Serpent and Jehovah are, in fact, one and the same,⁵ being different aspects of the Divine Power that created man. The Serpent gives man intelligence and free will, and makes him immortal. But theology has represented that man thereby sinned in disobeying God.⁶

The Serpent is, however, a dual symbol; there is a higher Serpent which signifies the regenerating power of Wisdom in Man, the Teacher and Savior; and a lower Serpent which signifies the abuse of knowledge for sensual and materialistic ends. But the Serpent in Eden is the good Serpent which teaches Wisdom. Read your Bible, Christian!

The result of this theological confusion has been to cast a slur upon the free, aspiring, independent element in man, and to make intellect, research, aspiration, invention, and unshackled art, antagonistic to piety. Never have we found these independent aspiring elements, the elements of progress, on the side of theology; the churches have always re-

sisted them, until compelled to recognize them, and then they have tried to father them and convert them to their own uses.

Man's passions are simply the forces of his animal nature which are uncontrolled, and which he must learn to control, so that instead of passions they may become useful powers for good. But what has theology done? It has told him that these passions proceed from an Evil Being, whom it calls Satan, and has terrified man with this bogey into thinking that he requires the help of a personal God and a vicarious sacrifice, aided by ecclesiastical intervention, to save him from its clutches. By confounding this bogey of the Devil with the Serpent in Eden, theology has persuaded man that he must distrust his own Divine Intelligence, for that this proceeds from the Evil One. In place of showing man the difference between ensnaring passions and elevating aspirations, between ignorance and wisdom, theology has told him that *all* free thought and aspiration for knowledge are evil.

It is this terrible misrepresentation that needs to be unmasked; for it is responsible for the awful conditions that prevail among humanity and for the inability of the churches themselves to redress them. Because the churches have neglected their duty of *teaching and instructing* man, man has been left to his own devices; and, though the so-called "Devil" has taught him much, yet for want of the guidance of a true religion, he has gone astray in many ways. We see man now on the verge of discovering various latent powers in human nature, but ready to misapply them all and bring trouble on himself, because there is no true religion extant to guide him.

It may seem to some shallow thinkers that Theosophy, in thus vindicating the Biblical Serpent, is countenancing evil and rebellion against morality; but, the fault is not that of Theosophy, but that of theology, as above stated. It is theology that has thus confounded the issue. The great Theosophical teaching is that man's Teacher and Savior is his own Higher Self, the Divine Spirit incarnate in him, an interior fire of Divinity itself as represented symbolically by the Serpent. This Higher Self theology has denied, converting man into a helpless suppliant at a throne of grace and teaching him to regard his intuitions as evil when they differ from accepted dogma. When man goes astray through following his own bent, the churches ought to teach him and help him; but, instead of doing so, they condemn his free will and initiative. It is exactly as if they were to try to overcome immorality by maiming the body—a thing which has actually been done in the history of religion and even proposed in our day; for the churches' teaching amounts to an emasculating of man's mind and moral nature; it would deprive him of the power to do wrong by depriving him also of the power to help himself.

Under the narcotic influence of this ecclesiastical teaching, what has become of the *Knower* in man? Do the churches teach that every man possesses, *by virtue of his divine birthright*, the divine Spark which can be aroused so as to become a Teacher to his mind? It would hardly suit their purpose to do so. But Theosophy teaches this most ancient and sublime doctrine. It calls upon man to recognize his innate Divinity and arouse

within himself the divine powers of Solidarity and Wisdom so that he may know the truth and mold his life in accordance therewith. This was the real teaching of Jesus, who sought to show men how to awaken their intuition and live the Life. "Be ye wise as Serpents . . . for ye are Gods." (*Gen.* iii. v; *Matt.* x. 16; *2 Cor.* iii. 16; etc., etc.)

Theosophy sets no ban upon knowledge, but points the way to an unfathomable ocean of it; it merely warns man against the delusions created by selfish desire, in the midst of which the churches leave him to flounder.

STUDENT

1. The serpent, the Tree of Knowledge of Good and Evil, and the Tree of Life, are all symbols transplanted from the soil of India.—*The Secret Doctrine*, ii, 215

2. [De Mirville is quoted as saying that the whole world of thought is reproached by the Church with having adored the serpent. The Zend Avesta speaks of it, as do the Vedas and the Eddas and the Bible (Moses is commanded to set up a brazen serpent as a Healer, and we are told in the Gospels to be wise as serpents). In Rome we find it in connexion with the Vestals, in Greece Asklepios cures by means of it. In India, among the Africans, the Mexicans, the Chinese, it is venerated.]

The intimate alliance of this symbol with the mysteries of religion, the darkest riddles of the Unknown, is reflected in their [the Algonkins'] language, and also in that of their neighbors, the Dakotas, in both of which the same words *manito*, *wakan*, which express the supernatural in its broadest sense, are also used as terms for this species of animals!—Brinton's *Myths of the New World*, p. 132

Frequently in the codices and carvings from Mexico and Central America we find the tree of life, in the form of the cross . . . connected with these symbols of the serpent and the bird.—Brinton, 141

[Christians] never realized that the Cross was an evolution from the "tree and the serpent," and thus became the salvation of mankind.—*The Secret Doctrine*, ii, 216.

3. Archaic philosophy, recognizing neither Good nor Evil as a fundamental or independent power, but starting from the Absolute ALL (Universal Perfection eternally), traced both through the course of natural evolution to pure Light condensing gradually into form, hence becoming Matter or Evil. It was left with the early and ignorant Christian fathers to degrade the philosophical and highly scientific idea of this emblem (the Dragon) into the absurd superstition called the "Devil." . . . The primitive symbol of the serpent symbolized divine Wisdom and Perfection, and had always stood for psychical Regeneration and Immortality. . . . Yet they all made a difference between the good and the bad Serpent . . . between the former, the embodiment of divine Wisdom in the region of the Spiritual, and the latter, Evil, on the plane of matter.—*The Secret Doctrine*, i, 73

4. It is humanity itself, and especially the clergy, headed by the haughty, unscrupulous, and intolerant Roman Church, which have begotten, given birth to, and reared in love the evil one.—*Ibid.* ii, 209

5. It becomes easy to see that Jehovah . . . and Satan (therefore the tempting Serpent) are one and the same in every particular. *There is no Devil, no Evil, outside mankind to produce a Devil.*—*Ibid.*

Jehovah was called by the Gnostics the Creator of, and one with Ophiomorphos, the Serpent, Satan, or EVIL.—*Ibid.* ii, 389

6. The "Serpent," moreover, is not Satan, but the bright Angel, one of the *Elohim* clothed in radiance and glory, who, promising the woman that if they ate of the forbidden fruit "*ye shall not surely die*," kept his promise, and made man immortal in his *incorruptible nature*.—*Ibid.* ii, 388

So little have the first Christians (who despoiled the Jews of their Bible) understood the first four chapters of *Genesis* in their esoteric meaning, that they never perceived that not only was no sin intended in this disobedience, but that actually the "Serpent" was "the Lord God" himself, who, as the Ophis, the Logos, or the bearer of divine creative wisdom, taught mankind to become creators in their turn.—*Ibid.* ii, 215

A Criterion for Critics

SOME of us are apt to say that critics and criticism are of no value in the world; this is because the wrong sort of critics preponderate. Again and again we are shown that the public is not capable of judging a piece of literature for itself, and that its taste does want the most strenuous guiding. Generally speaking, the cheaper and shallower a book may be, so long as it has some kind of life in it, the more immediately will it be appreciated and acclaimed. A great work costs some effort to read, and perhaps needs reading more than once before its beauties will be apparent; and as your man in the street has not the inclination for this, it needs a trained critic to rescue it from oblivion. Let someone, recognized as an authority, pronounce the thing good; and others will take courage to attack it seriously, and so come at its goodness; which they would not do as a venture of their own. They run the risk of being put to some trouble and getting nothing but boredom for their pains. People have not the energy to exercise their fundamental judgment at first hand, and over everything that comes their way. In speaking of books, we do but take these as a type; dramas, music, and even all kinds of ideas, are in the same need and predicament. The trouble is, to find a criterion for critics.

Paradise Lost falls upon a world in love with loose pleasure, fetches a paltry price, and is met with sneers from critics who clearly had no ability to judge. *Proverbial Philosophy*, without a note of poetry in it from beginning to end, and now happily forgotten, is acclaimed on its publication by the readers of England and America as the work of a great poet. The low music-hall dance, with nothing in it but vulgarity and worse, draws applauding crowds in all our cities. But the first has come, in a measure, to its own; the second had its few years of life; and the third is for one season only, and must give place then to something else of its own kind, but with still ranker flavor. The tastes it appeals to are not to be satiated nor set at limit, once one has elected to gratify them; feed them, and they only clamor for more and stronger stuff.

A man's animal passions are the most commonplace and vulgar part of him. Down on that plane there is no rank or distinction of kind; the differences of degree lie in how far one has consented to travel there. Life grows the more monotonous the lower it sinks. Rabbits are all much of a muchness; dogs, a thousand times higher in evolution, show some individuality. Tom's tastes are very much like Dick's and you know Harry pretty well when you know either of them; but the Leaders of men are sharply defined. Beethoven gives you no clue to Wagner, nor Shakespeare to Milton; at least no outward clue. The lower man, too, is the most external part of us as individuals; and as the individual is, so is the race: that which appeals to the most external, meets with the earliest response. So whatever has its center of gravity on that plane will find wide and indiscriminate welcome there, and there will be no two opinions about it among those whose demands it supplies. That which is to get to our very selves must pass this plane, and pass the superficial mind with its world of smug, shallow ideas

and conventions. What appeals only to the animal man need have no more force than will bring it to the outermost doors of the racial consciousness, and those elements in the race will rush to open to it at once. It never has enough life in it to keep it living for a number of years.

That which speaks to smugdom and conventional thought has a little farther to go, and needs a little more life to carry it there; hence the ready, temporary vogue of the Martin Tupper; only a little less ready than the others, and only a little less ephemeral. And one might go on to speak of that sense to which the aesthetic and perfectly finished appeals and so on. The rule is, that according to the depth it comes from and is directed to, is the life and strength in any work; the greater that depth, the less quickly will it catch the approbation of the multitude, and the more certainly will its sway endure.

Now, as it is the nature of the unaided public to give immediate approval only to the cheap and shallow, and to pass by unheeded whatever demands a little effort, do we not need a kind of critics that can discriminate between what is really vital, and the merely portentous and skilful in this latter class? This is where a mere literary training, necessary as that may be, is insufficient; for you must judge literature by humanity; art is for man's, and not for its own sake. Your true critic must understand the nature of man, and be able to distinguish the voice of the soul from all other voices. Nature is all consciousness, and the abode of ever active life; let him call that work *good* which so interprets her. And as for man, the soul within him is a god, ever at war with the lower forces of life. In spite of all seeming, heroism and compassion are the fundamental qualities of man; at last these qualities are to win through, and all clouds and meanness are to be driven away. Which are the books, the art, or the music, that will remind us of this, and further the cause of the soul? Those are the immortal works, the cleansing corpuscles; proclaim them, ye critics; and you will not err. Any other criterion falls utterly short of usefulness. K. V. M.

The Key to Asian Art

EVERYONE knows the story of the grapes of Zeuxis which appeared so like real grapes that birds came to peck at their tempting clusters. The Chinese have parallel fables about famous masterpieces, but how different an order of ideas they attest! A great artist painted a dragon upon a temple wall, and as he put the final touch to it, the dragon, too instinct with life, soared crashing through the roof, and left an empty space. The inner and informing spirit, not the outward semblance, is for all painters of the Asian tradition the object of art, the aim with which they wrestle.—From Laurence Binyon's *Painting in the Far East*

A MAN with a half volition goes backwards and forwards, and makes no way on the smoothest road; a man with a whole volition advances on the roughest, and will reach his purpose if there be even a little wisdom in it.

He that has done nothing has known nothing. Vain is it to sit scheming and plausibly discoursing: up and be doing.—*Carlyle*

Art Music Literature and the Drama

Inisfallen, Ireland

INISFALLEN, the principal island in Lough Leane, the largest of the Killarney Lakes, is remarkable in having the most fertile soil to be found anywhere. The pasture is of the richest all the year round. All kinds of trees, scented shrubs and plants are to be found here in abundance; and at one place there are three different kinds of trees growing on one stem, one of them the arbutus. There are many arbutus shrubs here. They flourish throughout the year, sometimes bearing at one and the same time leaves, blossoms, berries, and fruit in varying degrees of maturity. The leaves are of a very beautiful green, with a red stalk; the blossom resembles lily of the valley; the berries are first green, then yellow, then scarlet, like strawberries. It sometimes grows to the height of twenty feet, and is to be found also in Greece and Italy.

This island, many centuries ago, was the home of the O'Donoghue, as to whom the following remarkable account is taken from one of Samuel Derrick's letters, dated June 14, 1760:

The O'Donoghue, during his stay upon earth, manifested great munificence, great humaneness, and great wisdom: for, by his profound knowledge in all the secret powers of nature, he wrought wonders, as miraculous as any tradition has recorded of saints by the aid of angels; or of sorcerers by the assistance of demons; and among many other most astonishing performances he rendered his person immortal. After having continued a long time upon the surface of the globe, without growing old, he one day at Ross Castle (the place where he most usually resided) took leave of his friends, and, rising from the floor, like some aerial existence, passed through the window, shot away horizontally, to a considerable distance from the castle, and then descended. The water, unfolding at his approach, gave him entrance down to the sub-aqueous regions, and then, to the inexpressible astonishment of all beholders, closed over his head, as they believed, for ever: but in this they were mistaken.

He returned some years after, revisiting—not, like Hamlet's ghost, "the glimpses of the moon, making night hideous"—but the radiance of the sun, making day joyful, to those at least who saw him: since which time he has continued to make very frequent expeditions to these upper regions, sometimes three or four in a year; but sometimes three or four years pass without his once appearing, which the bordering inhabitants have always looked on as a mark of very bad times.

It was feared this would be the third year he would suffer to elapse, without his once cheering their eyes with his presence; but the latter end of last August he again appeared, to the inexpressible joy of all, and was seen by numbers in the middle of the day. I had the curiosity, before I left Killarney, to visit one of the witnesses to this very marvellous fact.

The account she gives is, that returning with a kinswoman to her house at the head of the Lake, they both beheld a fine gentleman, mounted upon a black horse, ascend through the water with a numerous retinue on foot; who all moved together along the surface towards a small island, near which they again descended under water. This account is confirmed, in time, place, and circumstances, by many more spectators . . . who are all ready to swear, and, not improbably, to suffer death in support of their testimony.

His approach is, sometimes, preceded by music inconceivably harmonious; sometimes by thunder inexpressibly loud; but oftenest without any kind of warning whatever.

The old tree in the picture has grown above one of the ancient holy wells, and close beside it are the ruins of a monastery that stood there more than a thousand years ago. Long before that, however, there was a round tower at this very place, a true tale of which was published in the *PATH* magazine during W. Q. Judge's lifetime. It had to do with the clouds that under Karmic law and owing to the nature of the cycle were to descend, and have since descended upon Ireland. It was toward

A HOLY WELL, INISFALLEN, IRELAND

the end of those earlier times when Amairgen chanted a poem in praise of the divine science:

This divine science, indeed penetrating the secrets of nature, discovering her laws, and mastering her hidden forces, was according to the tenets of Celtic philosophy, a being identical with those forces themselves, with the visible and the material world; and to possess this science was to possess nature in her entirety.

Amid these scenes, one ponders on that high worship of the spiritual within both man and nature, that prevailed millenniums ago, ere men began to anthropomorphize Deity, as the result of immersion in sense-life.

And the day may be nearing when a return to the purity, harmony, and simplicity of life engendered by the practical application of Theosophical teachings, will again unbar the gates to the enchanted islands of the soul and to the divine in nature. IRISH STUDENT

The Unrest of the Age

SEeking the cause of the degeneration of taste in the theater, the *Liverpool Post* (Eng.) says:

It is the terrible unrest of the age that is reflected in every walk of life—mental, physical, spiritual—that produces all these lamentable results. . . . Life has become too strenuous, too vicious, and the fight is little removed from the struggle between the beasts of the forest. . . . Far too often one man's success has to be gained by the failure of another. Man must live, they say, and that granted, there is nothing that is not permissible. . . . But other thoughts may trouble the soul of him whose heart is wrung by the study of cold statistics as to unemployed, paupers, lunatics, drunkards, imbeciles, and all the terrible products of modern civilization. . . . Sooner or later the human race will have to make up its mind which is the greater, the part or the whole, and whether the physical welfare of the few is to dominate and crush the mental and spiritual well-being of all created mankind.

The last sentence having a ring that might be taken as socialistic, let us alter it to "whether the supposed interests of personalities are to dominate the real interests of everybody." But our civilization needs something more definite than mere aspirations; and that is *knowledge*; and in the present state of our luminaries—ecclesiastical, scientific, philosophical, or what not—no one can pretend for a moment that we have anything at all approaching knowledge. Instead we have speculation in plenty, contradiction endless, theories that flout the intelligence and the voice of the heart. Bigotry is taking advantage of our intellectual chaos to fasten the chains of a disguised medievalism upon us. People follow blindly the voices of desire and pleasure, hearing no other voice and dreading the silence. The churches can show them no other voice, for the churches are themselves struggling in doubt. Science invents new instruments, speculates about the structure of matter, or dabbles in parlor necromancy with the spooks.

Theosophy alone speaks with the voice of authority—authority not vainly self-arrogated, but derived from its actual power to satisfy demands. It is Theosophy alone that can make people conscious of the presence of the Divinity within them, so that it may become a living power in their lives and regenerate the world, not by restrictive laws, but through the individual. STUDENT

Albrecht Dürer

IN No. 26 of this Review there appeared on this page the engraving of a portrait which the caption cited as that of Albrecht Dürer. This was an error, a simple oversight, the portrait being the work of Dürer, but the original of the painting being one Hieronymus Holtzschuer, as, indeed, appeared from the lettering in the upper left hand corner of our half-tone. An excellent reproduction of the well-known portrait of the great German artist, painted by himself, appeared in the *CENTURY PATH* of the issue of May 10, 1908.

We denounce no one, leaving this noble task to our enemies—*Helena Petrovna Blavatsky*

TO those who are still asking "What is woman's work in the world?" it is safe to say that woman's work is to do the duty of the hour. This rule will hold good whether the karmic conditions of her life are of a domestic, business, artistic, or social nature. A womanly woman is peculiarly fitted for certain types of activity which call for the intuitive, sympathetic, flexible, and patient human qualities; but occasion will also arise when she will cease to be womanly—will be merely feminine—if she does not also display the logical, just, firm, and energetic side of her humanity.

For a woman to select activities which are best suited to masculine ability when there is no lack of men to do the work, while she ignores the demands of other duties which a man cannot well perform, will be for her to act quite out of her sphere. Yet the occasion may arise when she and she alone can save the situation by doing the same strenuous thing under different conditions. There is no hard and fast line to define a woman's work, for she is the feminine phase of a humanity which has potentially all powers.

The race is higher than the sex,
Though sex be fair and good;
A human creature is your state
And to be human is more great
Than even womanhood.

When a woman is so free to choose her work that the finger-post of duty does not seem to point clearly, there is always the guidance of motive to determine a course of action. Why does she choose the professional or artistic career? Why aim to be a social leader? Why take up the study of sociology or the work of philanthropy? Why seek to found an ideal home for her future? Is it because she believes that the choice gives her the best opportunities for helpfulness, the surest means of meeting the keen wants of a needy world? Or does she think that the

WOMAN'S SPHERE

selection offers her the best chance for gratifying ambition, that it promises escape from ennui in novelty and excitement, or that it will bring to her the greatest personal happiness?

If, when not confined to a certain path but free to follow several, a woman chooses the one which promises the most personal gratification even to her aesthetic senses, can she

SPRING SECRETS

FRIENDS told me oft that corner was unsightly,
All overgrown with nettles rank and wild,
With vicious brambles, wasting ground where might be
Trim shrubs, then wondered that I only smiled.

How could they know that in that place neglected
Lay many a treasure known to none save me,
Sweet secrets of the Spring, all unsuspected
Unless by those who learn her Masonry.

'Twas there each year, where nettles grew most thickly,
Amidst the stalks the whitethroat built her home,
Whilst where the brambles trailed their vines so prickly
The long-tailed titmouse set her lichen'd dome.

In that waste spot sang garden warbler sweetly,
'Twas there the blackcap whistled to the dawn.
And later on the fledglings all would greet me
From that neglected corner of the lawn.—*Selected*

claim to be really working for the liberation of the best in herself and in others? Now that so many avenues are open to women, and they have proven their ability in business, professional and artistic lines, it is no longer a question of the right of the sex to public activities; but it is no less a matter of what is right for the individual woman. If she has home ties which have first claim upon her personal care and attention, then these karmic conditions, which she has assumed in this or previous lives, demand her services. If, on the other hand, her kindred or friends

desire selfishly to lean upon her and absorb the time, thought and strength which she could employ to larger purpose elsewhere, and which only encourage them in weaknesses, evidently her duty is to allow her near of kin to develop needed backbone, while she goes on to help *real* helplessness. One of the thousand ways in which the false teaching of vicarious atonement has distorted truth is this idea that we should be willing to sacrifice ourselves for the wholly selfish wishes of those we love. The truth is that there is no claim of purely personal selfishness which we are bound to respect. Neither the tie of blood nor of friendship gives us the right to do another's duty, for we make future action more difficult for that other by thus enervating his will, while we also neglect our own work. Real love is the recognition of the Higher Self and the divine possibilities in another: it is not catering to the purely personal desires of the beloved. The question is not what do our friends want us to do; the matter hinges upon *what action is just and right*. The gentle Nazarene was too loyal to the claims of the poor and oppressed to parley with the wants of the money-changers in the temple, and he lost no time in driving them out.

There are women who believe that softly-spoken words, gracious manners, fine raiment and conventional conduct are the essentials of a womanly character. The opposing type apes the manners and copies the styles of its brother men, and by word and deed tries to express an aggressive independence and freedom. Because of their limitations, both types fail to perceive either the finer essence or the wider range of the sphere of the womanly woman. Joan of Arc, a simple peasant maid, in man's attire, is a world picture of the sweet and heroic. Her "Voices" told her to save France and she did her woman's work as a great Soul, forgetting the shrinking body in the divine urge of one battling for the living truth.

In the light of Karma and Reincarnation, the real woman sees herself as something more than the character in which she is playing the present drama. An ancient writing says that the universe exists but for the soul's experience. In the face of this stupendous task of learning the whole truth by individually experiencing it, the soul, while in a woman's body, may more quickly and more clearly know the reality, if the destiny of the immortal self is not confused with that of the passing body. The ordinary belief that we live but once on earth operates to limit the conception of life and to identify the real actor with that one of his many costumes of flesh in which he happens to be acting at any given time. We are not our bodies nor should we be dominated by them.

Discrimination is called for to decide upon the suitable course of action at any time, and that is essentially a spiritual quality. It will develop, however, by and in proportion to the individual's unselfish work for the truth; and the woman who judges herself as a soul will not only know *what* to do but *when* and *how* to do it. L. R.

Theories as to Jeanne d'Arc

THERE are three kinds of views taken of Jeanne d'Arc, which may be designated as the religious, the scientific, and the historical. The first regards her as inspired, the second as a human phenomenon, the third as the creature of environment. But this enumeration does not leave a very distinct idea in the mind. It may make matters clearer to say that Jeanne's deeds are attributed respectively to inspiration, to genius, and to her being used as a tool by schemers. The religious view is held by churches, the scientific by Andrew Lang, and the "historical" by Anatole France.

The Roman Church, which had no use for the Maid herself, has found it more convenient, when called on to deal with her memory, to sanctify it rather than attempt to kill it. Anatole France seems, in a recent book, to have covered her memory with cheap and polished cynicism. Andrew Lang, in *The Maid of France*, has successfully vindicated her and confuted M. France, by an appeal to historical facts, in which domain he is an acknowledged master. It is significant that accuracy should thus support the nobler view, while the cynical view can be upheld only by inaccuracy.

In reviewing Andrew Lang's book, the London *Spectator* says:

The modern detractors of the Maid seek to eliminate not merely the supernatural but the abnormal elements of her story. They treat her as the puppet of designing ecclesiastics; they belittle her achievements in the field; they grudgingly admit her sincerity, while they contend, not without justice, that the English occupation of France must have come to a disastrous termination, Maid or no Maid. The case against the peasant heroine bears a strong resemblance to that against the "Stratfordian" authorship of Shakespeare's plays. On *a priori* grounds, it is ridiculous that a simple, illiterate child should have roused a nation from the depths of despair; should have convinced ribald men-at-arms and war-worn captains and sceptical Princes of her divine mission. It seems equally impossible that she should have turned to flight the armies of the aliens, and have given proof of that common-sense and rapid appreciation of the objective which stand second only to military genius. The answer is to be found in the pages of history. Joan did

make her way from Domrémy to Chinon; at the head of the most experienced warriors in the French Army she *did* compel the English to abandon the siege of Orléans; and she *did* bring her "gentle Dauphin" to receive the sacred unction at Rheims. And in the failures which marked the close of her militant career she was hampered more effectually by a lukewarm and treacherous Court than was ever Marlborough by the Dutch deputies or Wellington by the Spanish Junta. It was the magnitude of her triumph which caused her ruin, and made Bedford and the English nobles her ruthless foes. The Court of Iniquity never underrated her exploits; it only sought to convict her of diabolical possession, of being the agent of Beelzebub; and it is in this guise, as the potent instrument of England's disgrace, that she is masqueraded through the first part of *Henry VI*. So good an authority as Mr. Fortescue insists that her military talents were of the slightest; he admits, however, that at any rate "she possessed the magic of leadership and the amazing power of restoring the moral strength of her countrymen, which had been impaired, as never

gedy without parallel or precedent, the Flower of Chivalry died for France and the chivalry of France, which had deserted her; she died by the chivalry of England, which shamefully entreated and destroyed her; while the most faithful of Christians perished through the "celestial science" and dull political hatred of priests who impudently called themselves "the Church."

Thus he can recognize her loftiness of character and her great genius, but sticks at the wonders she accomplished by alleged supernatural means. Thus is the great stumbling-block for all the critics. But there is one explanation which clears up the whole matter. Once admit that purity of life and greatness of soul confer powers beyond the ordinary, and the explanation is simple. There is no need then to call in the aid of special machinery, whether divine, diabolic, or psychic. Jeanne was admittedly head and shoulders

Lomaland Photo. and Engraving Dept.

OLD HOUSES, STAPLE INN, HOLBORN BARS, LONDON

before, by an endless succession of defeats." Mr. Lang shows conclusively that her contemporaries, English and French alike, regarded her as "a military personage" and the leader of the hosts of the Dauphin; "it has been left," he caustically remarks, "to modern writers to contradict them."

M. France does not believe in anything miraculous or supernatural, and therefore rules out of order any testimony which includes this. Religious writers claim to believe in miracles, provided these are sufficiently far removed from the present day; so they do not reject so much as M. France does. Mr. Lang has ideas concerning psychic research, telepathy, and so on; and he interprets things in the light of these views. Thus each according to his lights. The churches maintain that Jeanne wrought miracles by divine inspiration; and some say by diabolic inspiration; and Mr. Lang argues for psychic phenomena. But Jeanne herself disavowed all these agencies. Mr. Lang says:

She was the consummation and ideal of two noble human efforts toward perfection. The peasant's daughter was the Flower of Chivalry, brave, gentle, merciful, courteous, kind, and loyal. . . . In a tra-

above her contemporaries in purity of life and character; is it so extraordinary that she should have greater powers than they? Is it incredible that gross living, callous selfishness and indifference, injustice, deceit, should render a man's body gross, his senses dim, and his faculties heavy and blunted? Does not Jesus teach us that purity of life and unselfishness of heart will open the inner eyes to the light and endow man with the power to accomplish wonders? What, then, was Jeanne but an exemplification of Jesus' teaching?

How little we realize the power of absolute purity of heart and singleness of motive! For lack of these our lives are made complex and difficult; and the difficulties we create we call "laws of nature." And when anyone avoids these difficulties, we say that he transcends the laws of nature. But Jeanne was simple and natural. Her will, untrammelled by tincture of selfish desire, accomplished its intent; acting in harmony with the real laws of Nature, she moved forward as their agent, backed by their might, and the obstacles raised by falsehood and crime melted away. STUDENT

OUR YOUNG FOLK

Râja Yoga at Santa Clara, Cuba

ON the evening of Saturday the 3rd, the Râja Yoga Academy gave a beautiful school entertainment demonstrating the progress which, in the two short months since this center of education was founded in our Capital, this method and system of education has been able to effect with its pupils.

We cannot but express to our readers the feeling of agreeable surprise which this little entertainment, so courteously offered to the parents of the pupils by the cultured teachers, produced upon us. Through it was exhibited conclusively the superiority of the method of education which is there employed.

Only two months has the Academy been established, and yet children whom it would seem impossible to teach, on account of their tender age, already show a knowledge of elementary subjects. And this is due entirely to the method of teaching; a method which avoids old practices which dull the intelligence instead of awakening it. It is as always, the spirit of progress in the present, in conflict with the backward tendencies of the past, —that progress of civilization which works as a subtle influence of reform thro' life and mankind in the path towards a greater improvement.

Good proof, indeed, it gives of the wisdom of the most excellent motto: "The perfect balance of the faculties, physical, mental, moral and spiritual," which expresses the ideal and aim of the institution of which we are treating, and which may be deduced from the following beautiful words of its philanthropic foundress, Katherine Tingley: "The real secret of the Râja Yoga system is rather to evolve the child's character than to overtax the child's mind; it is to bring out rather than to bring to the faculties of the child. The grander part is from within." And this is done without detracting from the practical ends of instruction in view, necessary to make of the children self-reliant, self-supporting men and women.

The entertainment was most beautiful. The invitations, which were given exclusively to the parents of the pupils, announced the following:

1. General March.
2. Military Exercises by the Boys.
3. School work by the Tots.
4. Daily Exercises by the Girls.
5. Mental Arithmetic by the Senior Girls.
6. Recitations in English by the Senior Girls.
7. Recitation in English by the Boys.
8. Action Song: "We are all little soldier men," by the Tots.

It caused, indeed, most agreeable emotion to contemplate that group of children of both

sexes, all dressed in white, ready to fulfil their duties, and responding with alacrity to the questions of their teachers. A beautiful picture, which lifts the heart and inspires joy in the many who have there in that bright gathering, portions of their own souls, confided to the school which is strengthening their minds and hearts.

The Hon. Nan Herbert, Directress of the Academy, received warm felicitations from the parents of the pupils, who offered their sincere congratulations on the ability and merit of the teachers and evident improvement in the children.

Mr. Leonard Lester, Director of the Academy, was also congratulated for the success

Miss Edith Wynn
Mr. Leonard Lester, Director
Assistant Teachers:
Miss Caridad Quesada
Miss Maria Muñiz
Miss Mercedes de Moya
Mr. Fernando Orpi
Mr. Espiridïo Santiestebán

Contributing also to the success of this beautiful entertainment was the presence of Miss Wheeler, teacher in the Râja Yoga Academy at Santiago de Cuba, who came especially for the event.

Our congratulations to the parents of Santa Clara, who may gladly confide in the merits of the institution in which their children will receive instruction in accordance with the noblest educative principles. And no less warmly do we congratulate the teachers of the Academy, who thus give proof of the reality of their promises, and accomplish the great work which is the object of this organization. G. P. (Translation from *La Publicidad*, Santa Clara. April 5, 1909)

PUPILS OF THE RÂJA YOGA ACADEMY, SANTIAGO DE CUBA

SHINE JUST WHERE YOU ARE

DON'T waste your time in longing
For bright, impossible things,
Don't sit supinely yearning
For the swiftness of angel wings;
Don't spurn to be a rushlight,
Because you are not a star;
But brighten some bit of darkness
By shining just where you are.

There is need of the tiniest candle
As well as the garish sun;
The humblest deed is ennobled
When it is worthily done;
You may never be called to brighten
The darkened regions afar;
So fill, for the day, your mission
By shining just where you are.

John Hay

obtained in the short time since the founding of the Academy. We have much pleasure in appending the names of the teachers in charge of the instruction of the children:

The Hon. Nan Herbert, Directress
Mrs. F. J. Bushby
Miss F. Mandler

In the Swiss Alps

THE villages in the Swiss Alps are often built on the top of a low mountain or in a deep sheltered valley; sometimes near a beautiful waterfall or a clear mountain lake; sometimes at the mouth of a deep chasm or at the foot of a great glacier.

Summer brings crowds of tourists flocking through these little hamlets to see the wonderful scenery around them.

As one drives or walks through the villages, one sees numbers of old and young women and children sitting out in the sunshine making lace. Old grandmothers and little girls work side by side with pillows stuck full of pins and threaded bobbins on their knees. They sell their pretty lace edges and insertings to travelers for less than we pay for machine-made laces in America. It is very slow work even for an expert lace-maker, and they work away at it all through the winter months that they may have a good supply on hand to sell to the visitors when they come in the summer.

The old men and boys are busy at wood-carving, making platters and spoons and forks, etc. with sprays and wreaths of edelweiss carved round them; little Swiss chalets that open, for work-boxes; the bears of Berne, and the Lion of Lucerne, and all manner of curious, pretty and useful things. L.

THE CHILDREN'S HOUR

The Blackbird and Elsie

THE blackbird walked about the lawn; walked, for blackbirds are never so undignified as to hop. Elsie watched him hunting in the short green grass for his breakfast and noticed his queer white eyes set far back in his head and said aloud to herself, "I verily believe that he can see out of the back of his head."

"Of course I can," he answered her in a sharp little voice, "because I need to in my business."

Somehow it did not seem strange to Elsie to hear the blackbird speak, because she had always thought they ought to talk, they were such clever birds; so instead of being surprised she answered him, "I wish I could see out of the back of my head; it would be very useful to me too."

"You will some day, when you need to," he said, "but just now you don't know enough, you don't even know who you are."

"Why I am Elsie Allen!" Elsie exclaimed.

"But who is she?" said the blackbird.

"She is a girl," said Elsie.

"And so is your sister Kate a girl; but what are girls and what are they doing here? what is their business?" and the blackbird gave a funny little squawk which was meant for a laugh.

"I don't know what our business is, unless it is to play and grow big. I never thought," said Elsie.

"Well, that's just it," said the blackbird, spreading his wings and displaying the green and gold on his shiny black feathers. "When you have thought long enough and begin to know who you are, then you will begin to see out of the back of your head. You have to think a great while to know who you are."

"You are a funny bird," said Elsie, laughing at him as he slowly stepped towards her through the short grass.

"Not in the least," he said: "I am a very sensible bird, if you will only stop to think about it; and if you would only stop to think about a great many things you would begin to grow sensible too. Why don't you begin to think out who you are and what you are doing? Then you would begin to ask more sensible questions."

"Don't I ask sensible questions?" Elsie asked him.

"Do you call it a sensible question to ask your mother why you could not play all the

ROBINS in the tree tops,
Blossoms in the grass,
Green things a-growing
Everywhere you pass;
Sudden little breezes,
Showers of silver dew,
Black bough and bent twig
Budding out anew;
Pine tree and willow tree,
Fringed elm and larch—
Don't you think that May time's
Pleasanter than March?

T. B. Aldrich

time and not go to school? That shows you have not thought who you are."

Elsie hung her head and said, "How did you know that?"

"Why," said the blackbird, "haven't you heard how birds always hear what children say? Ah! I hear Mrs. Blackbird whistling for me. Good-bye, Elsie. Tell me what you have thought about, next time I come," and he lifted his wings and sailed away over the tree, leaving Elsie wondering. EUGENIA

Springtime in Canada

FROM the woods came the *caw, caw, caw*, of a crow, and out in the garden a blue bird sang sweetly, "Phoebe, Phoebe."

But why such excitement? Ah! the children are weary of the long, snowy winter; and the sound of the crow and the blue bird is sweeter than music to their ears, for they know they have heard the heralds of spring.

How they joyfully rush to the house, shouting, "Mother, oh, Mother! the springtime is here! the springtime is here! for we heard a crow caw, and a phoebe-bird sing!"

Yes, the springtime is here. Adown the hillsides the melting snow sends little rivulets running to the low-lying meadows, and in a few days another welcome sound sends the children running also to the meadows.

Who can say which is happier?—the rushing, gurgling, falling, bubbling waters, as they meet in one loud roaring brook and all rush on together, anywhere, everywhere, nobody knows where—or the excited, eager children, who, with little paper or wooden boats sailing in the brook, run along, keeping pace with the waters, as they anxiously watch the tiny boats tossing, now here, now there, gliding around miniature islands of turf, or barely

escaping being capsized as they leap over rapidly rushing little waterfalls.

And here let us leave them—the laughing, happy children in the springtime of life, with the laughing, leaping waters in the meadow; both overflowing with the same wonderful, inexpressible joy of the spring. AUDREY

An Intelligent Horse

NEAR a farm house in the East was a large pond and on the lawn between it and the house an old family horse used to graze. One day some one left a baby asleep on a blanket under a tree not far from the pond. When it awoke it saw some swans on the pond and began to creep toward the water. It had gotten almost to the water's edge when the horse trotted up gently, and gathering the baby's clothes in his teeth carried it into the house. The baby was startled and began to cry and the mother rushed out of the house and found her child dangling from the horse's mouth. She quickly took it and the good old horse, whinnying gently, went back to his grazing. G.

Mysteries of the Human Eye

THE eye, says a scientific writer, is a "dark room" of such perfection that the cleverest manufacturer of optical instruments could not hope to copy it. Does not this suggest to all thoughtful minds the question, "How was that wonderful instrument designed?" If, with a certain school of modern scientists, we deny the existence of mind as a creator, then we must assign the whole of this marvelous handiwork to the operation of those most truly mysterious and all-potent gods of modern science worshiped under the names of Chemical Affinity or Molecular Energy. And the reasoning mind may well be excused for preferring the minor deities or nature-gods of older science, as being more comprehensible than these modern conceits.

Or is the eye the work of "God"? That were a far saner conjecture; and one can find no fault with the simple humble soul who rests upon this explanation: for one understands that he means, "I see that the world is made and directed by a vast intelligence too deep for me to fathom."

But while the word "God" may suffice for the simple soul, the mind that pretends to greater knowledge needs a fuller explanation. The Supreme Spirit may order all, but it uses agents. Man himself is one of these agents; then there are the animal souls, the plant souls, and the mineral souls; and the minor intelligences innumerable that operate in nature, formerly called "nature-spirits" or "gods," now called "forces" and "properties."

The only way to get an adequate notion of how matter is organized into its countless marvelous fabrics is to assume first the existence of *mind* and to regard matter as a product or manifestation thereof. Before the physical eye came into being, there was the astral eye, built of a finer and superior kind of matter, invisible to the ordinary physical senses. That astral eye, in its turn, was born from the substance of mind. The eye first existed as a thought; and thought has an inherent power of creating a form corresponding to itself.

Then what is it that maintains the eye in all its integrity throughout life? The inner type remains permanent throughout all the changes of the physical atoms, and the new atoms are built into the pattern.

What is it that makes a muscle contract? Science can see that the particles of the muscle come closer together; it calls this phe-

nomenon a case of affinity or attraction, and then tells us that affinity or attraction causes the muscle to contract; and then it docketts the whole business an "explanation." Well, the mind acts on the *linga sarira* or subtle body, making it change its shape; the physical atoms of the body follow the *linga sarira*, and so the body in its turn moves.

The eye contains transparent windows of varying consistency and optical power, a sensitive screen that catches images and somehow transfers them to thought, and a system of muscles that can turn the camera about, focus it, screen it, etc. The entire mechanism acts as one whole. It is absurd to imagine all these separate functions conspiring, as it were, together.

The eye is a unit; the power of seeing is a fundamental attribute of mind, and the physical eye is merely an externalization thereof. In the cameras constructed by man, one has to turn a lot of screws, etc. But the eye is so closely connected with the mind that the slightest volition adjusts the focus of the lens, fixes the diaphragm, directs the aim, and accomplishes all the necessary operations. The question as to how the subtle body (*linga sarira*) responds to the movements of the mind, and how the physical body follows the subtle body, and what part atoms and electricity play in the process, belongs to ultra-physics; and we have to clear our mind of certain limitations before we can successfully grapple with that question. It is known that rays of light produce alterations in the chemicals at the back of the eye; and it has recently been ascertained that electric currents, discernible by a galvanometer, are also set up when light falls on the eye.

Electricity is a connecting link between the physical and that which lies beyond. To the eye of physical science it appears as a something which is neither matter nor force, and yet both, moving in accordance with impulses from an unknown source. It acts as a spirit for physical matter, and as a body for mind.

In *The Secret Doctrine*, it is pointed out that such is the mystery of the human eye that scientists, in their vain endeavor to explain it, have had to resort to occult explanations. For the development of the human eye gives more support to occult anthropology than to that of materialistic physiologists. The eye in the human embryo grows outwards from within the brain, instead of being part of the skin as in insects and the cuttle-fish. This conflicts with the Haeckelian view that the vertebrate eye originated by changes in

the epidermis. This fact is one of many which prove the untenability of the Darwinian hypothesis and show that man is not a product of mere development from the animal kingdom. His eye is an externalization of the spiritual eye, and its connexion with the brain indicates this fact. The eye in those lower animals is a different kind of organ, as shown by its being a modification of the skin. STUDENT

Feminine Aspects of God

A WELL-KNOWN Protestant clergyman is quoted as having said:

While not making the Virgin an object of Protestant worship, it would be perhaps to the enrichment of Protestant thought and religion if with somewhat more of distinctness it recognized in the divine character the existence of feminine qualities. To Protestants God is almost exclusively masculine, but people want a divine mother as well as a divine father, and a deified virgin in a way meets this craving.

This clergyman evidently recognizes that there are two classes of deities, but he has got them mixed. One class is the deity whose power and presence we perceive in ourselves or in nature; the other class is the deity we create to suit ourselves and "meet our cravings."

The Roman Church has borrowed most of its symbolism from paganism. Its Virgin is often represented with the lunar crescent, like Isis; and she is adored by Mediterranean sailors as the goddess of the waters, as Astarte was invoked by their Phoenician predecessors. But there is a chasm between the sublime Isis Urania and the modern Virgin.

The Protestant God is, as stated, a masculine conception. For the feminine conception we must search outside religion, and we find it among the poets and artists as Mother Nature, the bountiful and beautiful. This is our Isis, our Astarte. Monotheistic as Occidentals claim to be, they are persistently dualistic in their conception of the great Powers, and continually refer to this goddess Nature. It would be interesting to listen to a sermon by some great theologian defining the exact relation between God and Nature and their respective functions.

But with the ancients there was a higher Nature, and a lower one; and Isis was not merely the spirit of animal and terrestrial life—there were other deities for that, like the Roman Pan—but the Spirit of eternal Wisdom and Bounty pervading all being. Similarly in man, the Microcosm, we have the animal soul and the Spiritual soul. The Virgin is usually a symbol of the former; she is rarely, if ever associated with Wisdom, the Spiritual powers in man, or with art and science.

But in truth we have not even an All-Father in our religion; for the personal God, as usually conceived, does not answer to that sublime conception. The Occidental God is a theological conception, an extra-cosmic deity. But Osiris represented the Universal Spirit in its positive or masculine aspect, latent in every atom, standing for the highest power in man. This Higher Self of man was regarded as the Son. We have to regard man himself as a manifestation of Deity, distinguishing carefully between his lower terrestrial nature and his higher divine nature.

And we must be careful not to fall into anthropomorphism—form-worship; for the

words "masculine" and "feminine" are used symbolically, not literally. People should not want to worship a Great Woman, created in the imagination, nor yet a Great Man. This would be pure idolatry, fetishism. We want to recognize the presence of a Supreme Spirit everywhere, one in its essence, but capable of being conceived under many forms, masculine, feminine, etc. STUDENT

"Thou Shalt not Steal"

THE CENTURY PATH is not afraid to advocate unconventional views, and therefore makes no apology for giving an extract from the *Wall Street Journal* as a specimen of religion. This will shock some people, who will think that the *Sunday at Home* would have been a more likely quarry for such material; but the Theosophist regards religion as the essence of glorified common sense, and there is common sense in the remarks quoted below.

The article is headed "Thou shalt not Steal," a commandment which has been posted in the Third Avenue cars; and the writer argues that there are other forms of stealing, besides the one meant, that need attention. In illustration the following story is told.

In an apartment house where the apartments rent at \$125 and upwards lives a lady who has instructed her little girl, when going to school, to avoid paying the conductor whenever possible. This the child does; but now mark the sequel, wherein the sin of the parent breeds its own kind. The child keeps the stolen pennies for herself, arguing that if it is not wrong for her mother to swindle the company, it is not wrong for her to swindle her mother.

The paper comments that there is not a school teacher or minister of religion who could not cap that story with one as bad.

It seems inconceivable that a mother could deliberately work for the damnation of her child's soul, but this mother evidently never thinks whether the child has a soul or not. It is all very well to pillory the traction magnates in our popular newspapers and make moral umbrellas of them to shelter the reader, but it is by that reader that the real effort for betterment must ultimately be made.

We are starting at the wrong end. Too many of us are bringing up our children without any moral training at all, and in doing so we are poisoning our supply of good citizens at the source. Every good citizen ought to know that 95 per cent. of the evils we suffer from, social disorders, contempt for the law, petty and large commercial dishonesty, are practically beyond the reach of legislation.

The law is not obeyed because our children are not taught obedience from the time they are capable of receiving parental instruction. We have lost in great measure that old-fashioned directness which taught that breaches of God's law inevitably meant punishment here and hereafter. For that sound and healthy doctrine we have substituted a flabby toleration which expects something positive to be achieved from a purely negative attitude. . . .

We are teaching children that education can be acquired easily, when we know that discipline and effort are themselves the education, and not the thing learnt.

The paper has hit the nail on the head; but the CENTURY PATH cannot follow it in its recommendation of an appeal to the clergy. The clergy have allowed this to happen because they had not and have not the means to prevent it. It may well be asked whether the ministers of religion are to teach us or whether we are to teach them and a logical mind will doubt whether a teacher who has failed to do his duty by his pupil can be suc-

cessfully corrected by the pupil himself. No, we must look to another source than the ministers of religion; facts show that we might better look to the financial press.

One cannot but sympathize with this arraignment of the cant which shelters itself behind misconduct on the large scale. The Great Law, and all human minds in harmony with it, judge not by results but by motives; and by this standard the petty peculator is as guilty as the magnate, with an added meanness and hypocrisy. Yes, it is true that the remedy for all social ills must be administered at the source. That source is in the individual, in his little daily motives, thoughts, and acts. These are the bricks out of which the social structure is built; out of these tiny threads is woven the whole fabric. And the children, again, are one place to begin at; but this implies wise teachers for them.

Here is just the point where all ordinary remedial suggestions break down and fail, and Theosophy steps in with the only practical suggestion. We have seen that our writer can only suggest the ministers of religion. If he means that we should have more religion of the kind we have, it can only be pointed out that there is a very general opinion that we already have enough, or more than enough, of this kind of religion, and that an increase of it would do no more good and might do harm. If he means that the ministers should teach a better kind of religion, one may ask who is to teach the ministers? No, we cannot expect any help from the churches; they are as helpless as others, either repeating worn-out platitudes and out-of-date dogmas or else floundering in a sea of doubt. And to other quarters we turn equally in vain; science has plenty of theories—too many of them; but none of them get down to the roots of human nature, touch the conscience, and inspire to noble effort and the performance of duty.

Theosophy alone has been able to evolve the needed system of education and training, because Theosophy alone has the knowledge on which to base its practice. Theosophists believe in the philosophy they teach, and their daily lives consist of a never-flagging endeavor to live up to that lofty philosophy. Hence they are able to influence the young, not only by precept but by example.

The churches cannot succeed because they do not teach man that he is a soul, but tell him that he is a weak helpless creature born in sin and needing the help of Jesus. This is like telling a man that he has no vitality and needs to be perpetually coddled and drugged. The churches offer no effective motive for right-living; the promise of *post-mortem* reward and the threat of *post-mortem* punishment are too shadowy and they appeal to base motives. But Theosophy teaches that man is a soul—and demonstrates it. It calls forth all the innate vigor and goodness in the human nature, endowing people with true self-respect and confidence in themselves.

Again, Theosophy teaches solidarity, not in the unconvincing meaningless way of a preacher who has no rational philosophy of life to justify his precepts, but in a way that shows it to be the true logic of life. These are the teachings needed for overcoming our social evils at their root; and the failure of other resources will compel people to have recourse to these teachings. H. T. E.

Some Views on XXth Century Problems

"In Touch with the Infinite"

MANY a man, reading some of the newer systems of philosophy, must turn from the books with the half uttered question, Well, what can I do about it? He has learned that at one pole of his consciousness he is "in touch with the infinite." That seems a large fact to know, but what is the practical application? There must surely be one.

Then perhaps he turns to some reading in the "New Thought" key, and instead of "infinite" he finds "All-embracing Good," "Enfolding Beneficence," and terms of that sort. He is recommended to dwell on these words till their meaning becomes a living entity in his consciousness, till he feels himself surrounded by something corresponding to the description and becomes prepared to make demands upon it for whatever he wants.

The writers of the psychology books are apt to sniff superiorly; they had laboriously thought out their "infinite"; it is an august philosophical conception; they do not want to see it emotionalized and sentimentalized. Nor do they sniff any the less superiorly at the great mystics of the past, who having reached an equally austere ideal conception, developed the relation in their own way and then called themselves gnostics, — knowers — of this "infinite."

If we are "in touch with the infinite," there is clearly something worth while doing, at any rate trying. Can we develop the "touch"?

Here we sight the flaw of the philosophies. They have got to the "infinite" too soon; they have not done enough with the *man*.

Let the man look within himself, not as the philosophies and psychologies do, but more practically. He finds himself a mass of thoughts and sensations and desires. The thoughts are memories of yesterday, anticipations of tomorrow, plans of what he will do, ideas of what he would like to do, conceptions of other people in their relation to himself. He is in short the center of himself. As such, most people live their whole lives. They live in a false I-world and are false — because ever changing — I's. If they will hold back and look at what is going on in themselves they can see this false *I* running up and down its gamut of plans for itself. And at that very moment a deeper *I* sees the futility and emptiness and selfishness of it all.

What is it that effects that piece of criticism, that in that moment knows that it cares for none of that gamut, that its interests are far other? It is *that* that is in touch with the Infinite, not the other whose very essence is to change, to be occupied with the changeable, and to be self-centered upon a center that death blows out like a flame. The false *I* wants something, and its conception of the "infinite" is of a want-supplier. It takes from life.

But the other *gives* to life; it leaves all things the richer for its presence and its work; it flows out in beneficence; its key is compassion. It is of one consciousness with the Infinite; the great waters flow constantly into the vessel. Its conception of the Infinite is

Light, and in that conceiving it becomes Light and is already eternal.

This is the path, to try every day to awaken the deeper self — more exactly, to awaken the common self to it and blend the two, and to carry the special effort through the day. There is no other permanent happiness; there is no other way to know the soul of the universe and its working and its why; no other way to bridge the gulf of death and pass across in utter peace leaving behind a million thoughts and deeds as benediction to men and a heritage against the next birth; no other way to be the divine man of time and eternity.

STUDENT

As to Shakespeare

MARK TWAIN has, it appears, given in his adhesion to the Bacon side of the Shakespeare-Bacon controversy. His argument is contained in a parable.

We will suppose a case: Take a lap-bred, house-fed, uneducated, inexperienced kitten; take a rugged old Tom that's scarred from stem to rudder-post with the memories of strenuous experience, and is so cultured, so educated, so limitlessly erudite that one may say of him "all cat knowledge is his province"; also, take a mouse. Lock the three up in a holeless, crackless, exitless prison-cell. Wait half an hour, then open the cell, introduce a Shakespeare and a Baconian, and let them cipher and assume. The mouse is missing; the question to be decided is, where is it? You can guess both verdicts beforehand. One verdict will say the kitten contains the mouse; the other will as certainly say the mouse is in the tomat.

The point is clear enough; Shakespeare is the kitten, Bacon the hardened old cat.

But we would recommend people, all the same, to retain their belief in Shakespeare and not even to say with the man in the (literary) street, "What's the odds who wrote the plays so long as we've got them?" The Shakespeare phenomenon would be more frequent if we were taught to live lives a little less pre-occupied with the externals. We should not have to depend upon the present for nearly all the working contents of our consciousness. The vast accumulations of other incarnations of the soul would become accessible. Where did Mozart learn the laws of harmony he used at the age of three? In most of us the soul is but partially, even slightly, incarnated. It rather acts inductively upon the personal character than enters it fully. Thus we get but *aptitude* for this or that instead of commanding *genius* for it. The aptitude-stage Shakespeare showed by his sonnets; as soon as, by their composition, he had his technical instrument ready, the rest of him took charge. Wagner wrote *Rienzi* before he wrote Wagnerian music. We have to learn the difference between the individuality, the soul, charged with the gleanings of all past time — and the personality, too often charged with nothing but "personalities." But those who in any past life, from the desire to help and teach, have effortfully seized their individuality, will find in future lives that they command genius, not mere aptitude. Whatever the direction in which it shows itself, its products will more or less definitely affect the current of their times. That is its special mark.

The existence of the plays cannot be denied; they cannot be induced to get lost. The worst that the anti-soul element in human nature can do, operating through thinking instruments, is to juggle with their authorship. Having thus loosened them from their roots, the next step will be to ascribe them to several men. The movement is really a tribute to Shakespeare's power. Any soul starting liberating currents in the field of human thought, sooner or later wakes up the contraries. Bruno's burning and the Bacon idea are respectively an extreme and a mild example of the same force. The assertions that Homer's poems were the work of many; that William Tell never existed; that the mighty civilization of the Incas is a myth — are other examples. In the individual the same process may occur. A man studies Theosophy for a while. His soul begins to come into action. He must now do something, either give up a few practices which he wants to pursue, or — deny his nascent intuition. His worse self, aroused to prophetic self-defence, may bring him to absolute and all-denying materialism, and bitter hostility to Theosophy and its Teachers.

STUDENT

The Inner Speech

A MAN who proposes to go and live for a year or two in a foreign country usually takes pains to learn its language in advance so that he may at once feel somewhat at home and understand the situation.

Yet men implicitly propose to *die* into the other country without the slightest preparation in its language. They never even consider whether it has a language.

When at death all the sense-organs stop working; when a little after death the wound clock of the objective mind runs down, what is then the mode of consciousness? Surely it is worth while to learn that mode during life.

In looking upon the objective world we see the *work* of the world-life. The consciousness of that life, the life itself, we know not. We are as a man whose hands and legs should so tremble that he could neither walk nor grasp anything, and had then evolved a theory that neither walking nor grasping were possible. "If there are such arts — and they seem to me to be dreams of the metaphysicians — they must ever be inconceivable and unpracticable." We should advise such a man to get the power of stopping at will the futile tremblings, knowing that the power to walk and grasp would then be found present in him.

And the conscious thinking of our real life is present within us and may be our own conscious thinking when we have learned to master instead of being continually mastered by the objective mind. Is not prayer, in its proper meaning, just this, the withdrawal from the mind into an inner silence which presently fills with meaning and significance? By it man's powers finally become unlocked and he learns who and what he is. One of his instruments is no longer permitted to assert itself to be himself.

The Isurumuniya

THIS temple is one of the monuments built by King Dewenipiatissa, about 300 B. C., to mark his zeal for Buddhism, which had been either introduced or regenerated by the royal missionary Mahindo, son of the Indian King Dharmāsoka. It is a beautiful example of the adaptation of natural scenery, in contrast to the plan of dumping buildings of a ready-made design upon a site to which they are not suited; but the original effect is modified by certain modern additions of a less successful order. For this dagoba is partly carved out of, partly enshrines, the natural rock of an abrupt hill. The shrine is approached by two terraces; the outer wall of the upper one being ornamented with a most remarkable series of seventeen frescoes in low relief, the subjects being symbolical and in marked contrast to the customary decorations of a Buddhist shrine.

ISURUMUNIYA TEMPLE, ON THE TRINCOMALEE ROAD, CEYLON

Surgery in Ancient Nubia

AN article in the *New York American* gives some account of the discoveries in the burial grounds of Nubia. The necessity for inundating a large area, owing to the construction of irrigation dams, led the government to make a complete survey of the part of Nubia affected. Forty-eight cemeteries were explored and some 6000 bodies examined. The pre-dynastic ones, though at least 6000 years old and not embalmed, are in a state of wonderful preservation, owing to being entombed in warm sand. From them we learn that there was much less disease among these ancient Nubians than among us, and also that surgical skill in those days can, in some respects at least, compare favorably with our own.

The commonest disease of which indication is found is rheumatoid arthritis; but the bones do not give any sign of either tuberculosis or rickets. The teeth were in very good condition, and signs of caries do not appear until the late periods. A large collection of healed fractures shows that the results of the treatment of broken bones are no better today than six thousand years ago. STUDENT

Inca City Unearthed

THERE has just been discovered in the south of Peru on the banks of the River Apurimac a most beautiful Inca city called Choquequiran, of majestic aspect and with splendid buildings. The discovery was made by a society organized with ample funds for the purpose, which after many days' search succeeded in finding it in an almost inaccessible region on the river banks. The city has been ascertained to occupy an immense area, and to have been built to serve as a pleasure resort

for the imperial family. There are magnificent palaces, some of which contain apartments of more than forty meters in length by ten in width. The buildings are in an excellent state of preservation; and what has most aroused the general interest is that the conquerors did not reach this spot, where it is believed that the remains of the royal family have reposed since the invasion of Cuzco.

On cleansing the buildings from the vegetation which covered them, the explorers found various objects of champi and of silver, gold ornaments, and tombs. In one of the rooms were found bodies in various postures, some upright against the walls, others seated and holding each other's hands.

It is stated that the architecture much resembles that of the palaces in the ruins of Ollantaytambo but surpassed them in size. (Translated from the Spanish of a Valparaiso paper.)

Accounts like the above, which are becoming more frequent, contribute to show that there is plenty to be discovered about the civilizations of ancient America when we really get to work looking for it. Would it not be more logical for some theorists to defer their speculations about human "origins" until a few more facts have been collected?

STUDENT

American Mummies 8000 Years Old

MUMMIES more than 8000 years old, say press dispatches, have been found in Peru by an English antiquarian, who has described his discoveries to New York scientists. They were found under an old Inca burying-ground which he was exploring in the mountains about 200 miles inland from Lima. The date of the interments is placed at from 4000 to 7000 B. C. The bodies crumbled rapidly when air was admitted; but they had been kept in an excellent state of preservation by the silica of the soil; the hair, skin, and clothing being intact. The cast of their features resembled, according to the explorer, the Mongolians, with a scattering of Indian and Negro types. The bodies were fully clothed in embroidered

garments of fine texture. The usual abundance of vessels and implements was found in the graves. The pottery was artistically designed in the shape of men or animals, and the glaze was as perfect as when put on—probably about 6000 years ago. Many of the specimens were decorated with Chinese dragons and weird-looking fish resembling mermaids.

There were great urns, some of them six feet long and so heavy that it required three men to carry them; they were beside the bodies and had the features of the deceased represented on them, as well as hieroglyphic inscriptions. The explorer has brought home 2000 specimens of weapons and pottery.

It is noteworthy how rapidly the evidence for the existence of great pre-Inca civilizations is increasing (observe the "Chinese" dragon). All goes to show that the Western continents have been the home of mighty races in the far past, just as is the case in the Eastern continents. All goes to show that on both sides of the world the races came from the same original stock. The description of the facial types shows how vain it is to try to fit the ethnography of a period so remote into the schemes made for today. What significance could such terms as Negro, Mongolian, and Indian, have in connexion with such times? But we get a clue to the problem when we remember that all these races are alike descendants of the mighty races of the past, in which all the diverse types may have been combined. The races have split up like a solar ray, each being but a single refracted hue.

The custom of interring implements and food along with the deceased is so invariable and universal that no sane mind can regard it as based on other than actual knowledge. In common with humble tribesmen the most cultured races have practised it. The practice undoubtedly depended on a knowledge concerning the after-death conditions of the different principles in man and on a desire to provide for them properly. But it is difficult to speak now-a-days on such a topic without giving rise to superstitious misconceptions and seeming to countenance such errors as spiritism. The ignorant critic of today has reflected his own ignorance upon the people of the past and has assumed that these posthumous provisions were made for the benefit of the immortal Soul of the deceased; but only the ignorant would make such confusion between the immortal Self and the mortal relics of the departed.

We are also learning that skill and art are by no means of recent growth. STUDENT

The Trend of Twentieth Century Science

Reclothing an Island

GIVEN an island, a moderate distance from anywhere, whose every trace of vegetation has been destroyed by a volcanic eruption, and which has received a heavy overcoat of pumice and ash — how will it be re-seeded and re-greened?

This was the problem set in 1883 for Krakatoa to solve. It dwells in the Sunda Strait, between Java and Sumatra, and its volcanic denudation in that year was complete and satisfying. But in 20 years nature had as completely replaced what she took. In 3 years she had arranged a thin vegetable mantle from the shore to the peak. This was woven of the lowest forms of vegetable life, blown on the winds: blue-green algae, diatoms and bacteria. There were also nine species of flowering plants whose seeds had been washed to the beach by the waves.

Until 1906 no one took the trouble to go again and see what had gone on. But by that time it was almost as if there had been no destruction. The winds, the waves, and the birds had all been at work importing seeds, in size from the coconut downwards. Altogether there were 137 species of plants. Near the beach was a forest of strand plants and climbers, including *Casuarinas* 40 and 50 feet high. There was a *Cycas Circinalis* with a trunk nearly six feet high. There were tall coconut palms laden with fruit, with seedlings a yard high at their feet. Farther in were fig trees, screw pines, and other trees, and everywhere grasses and sedges.

This is extraordinarily rapid work, for the soil had to be made. The inorganic matters are of course present in the ash and pumice; but before this primal soil could be used by the higher vegetation it had to be penetrated by humus, by generations of lichen, algae, diatoms and such like organisms that can transmute the inorganic salts; then shot through with the roots of mosses, fungi, and ferns, whose seeds were brought by the birds; and thus gradually made suitable for the larger plants. Had the surface all been pumice, requiring to be eaten away film by film by the lichen, the process would have taken ages. But the fine ash permitted of much quicker work.

A difficult problem was presented by a species of *lizard* nearly a yard long! How did he get there? Did he evolve from — what? Did he float there on a log? But he kept his secret.

STUDENT

The Heat Layers

NO one has yet offered any complete theory to explain the heat layer of the atmosphere. Until very recently we have been supposed to live at the bottom of a structureless pool whose temperature uniformly decreased (one degree F. for every 300 feet) with the radial distance from the crust.

It does so — up to about six miles in height near the poles; much more near the equator. Then comes the warm or hot layer, extending out how far into space we do not know. We

do not now therefore know the shape of the atmosphere; if it correspond to that of the crust-facing surface of the hot layer, it is an ellipsoid.

The French discoverer of the layer found also that its height above the ground varied (to the extent of 8000 feet) with the barometric pressure. An American meteorologist, enthusiastic enough to send up 77 sounding balloons, corroborates these findings.

An Austrian then took up the tale, examining a series of barometric observations from all parts of the world. He found a curious and inexplicable variation of pressure occurring twice daily at twelve-hour intervals, most marked in the tropics, and at the same time along the length of each meridian.

The atmosphere, or at any rate the hot layer of it, is therefore a *pulsating* ellipsoid with two pulses a day, the expansion being greatest around the equator.

We now want to know what strangely functioning layers may lie beyond this hot one.

Science and Philosophy

IN the columns of a monthly contemporary, Professor Robert Duncan has been forecasting the possible future of chemistry. Advancing step by step, it may, he suggests, reach proof that the whole of our physiological life is nothing but an unbroken chain of chemical actions and reactions; that we are, on that side, an electro-chemical mechanism; that life is electro-chemistry; that the test-tube of the future will be competent to explain every vital phenomenon. Protoplasm will be put together in the laboratory as indigo is put together, and will then exhibit all the properties which we find it to possess. Where then will be need to speak of, where will be room for the work of, any mysterious entity called "life"?

The Professor points out that whilst science is coming nearer and nearer to this contention, it is a curious fact

that there is today, in America, no teacher of pure philosophy of any prominence who is a mechanist, nor, indeed, any of the highest standing in Europe.

The scientist and the philosopher come at the problem from its opposite ends; the one sees everything in terms of matter and mechanics, *and wants to do so*; the other requires that the certainties of consciousness shall be considered. Where is the place of compromise?

Suppose that by an effort of will I call up in my mind the subjective thought — a modification of consciousness, consciously directed throughout — of a lemon. In a moment the chemistry of my salivary glands is so affected that my mouth fills with saliva. How is this if all that takes place in the body is a chain of chemical reactions each necessitating the next and necessitated by the last? Chemical reactions were started here by something which was *not* a chemical reaction but an action of consciousness.

But the philosopher will not maintain that the force set at work in the glands was *cre-*

ated by consciousness. It was there or elsewhere in the body before, and was guided. If life added to, or lessened, the forces in the body, it could be detected by the laboratory scientist; so long as it merely guides them his measurements of them will come out on paper as if they were not there at all. Consciousness can *guide* a given quantity of force into arm or leg or gland, neither adding to it nor taking from it.

That the body is a mechanism in which every muscle and gland and nerve functions through chemical law, and through nothing else, is a conviction that grows with every passing day; furthermore, if by "Life" is meant a spiritual entity that is *interfering* with these chemical processes, its existence may with reasonable safety be denied. But if by "Life" is meant a spiritual entity that abides within the body, and to a limited extent guides and directs its activities *without interfering with its energetics*, we cannot possibly deny its existence; our only means of detecting such an entity is through interference.

But that does not *complete* the reconciliation. Suppose we were to say that the lowest plane or degree of Life is the forces of the laboratory, of chemistry, of electricity, and the rest; that its conscious and volitional side is, on that plane, at a minimum; that on the next plane, that of physiological life, its conscious and volitional side is taking command and that it from there guides the forces of the plane below because they are aspects of itself. The human spiritual entity is *again* a monad of itself on a still higher plane, conscious of monadic self-hood. In that conception, well thought out, the difficulty ceases.

The Peril of the Fly

THE United States Department of Agriculture has been studying the common house fly, finally confirming the suspicions that have been gathering for some years. The insect is usually called a scavenger, a remover of decaying matter. But where does it remove it, and what is decay? Decay is a bacterial process and decaying matter has upon it not only the bacteria which cause decay but all other kinds of bacteria that are in the air. These coat the legs and lips of the fly and are part of what it eats, multiplying within it. The average city fly, and the average fly in the neighborhood of manure heaps or heaps of any kind of refuse, has upon his person 1,250,000 bacteria. The report ranks him with water and milk as a conveyer of typhoid; whilst a number of other diseases, from cholera and tubercle downward, are also actively spread by him. His wife lays 120 eggs at a sitting; she will do that every ten days; and the eggs require from ten to fourteen days to develop. The report recommends various obvious measures, dependent upon the insect's habits. As the principal habit is to breed upon decaying matter of any sort, vegetable or animal, no such matter should be allowed to accumulate. And as the breeding takes ten days, the emptying of ash barrels, removal of refuse piles, etc, should be at least a little oftener than that.

Age to which Trees Live

AN authority of the forestry service at Washington gives these figures as the maximum age to which trees attain: pine, 700; silver fir, 425; larch, 275; red beech, 345; aspen, 210; birch 200; ash, 170; elder, 145; elm, 130. The heart of the oak begins to rot at 300 years.

Mistakes in Tree-Planting

IN *Nature* (London) is a report of investigations conducted by the Duke of Bedford and Mr. Spencer U. Pickering at the Woburn Experimental Fruit Farm, which tend to a reversal of what is described as the orthodox method of planting fruit-trees. It is an article of faith, we are told, that the soil must be properly prepared, a large hole made, the roots carefully spread out in all directions and arranged near the surface with a slight upward bearing at the ends, the soil filled in with many precautions, small quantities of the smaller soil worked in among the roots, hollow places caused by archings in the stronger roots filled up, and the rest of the soil put in and carefully trodden down.

But all this, we are now assured, is not merely waste labor but positively injurious. The proper way to plant a fruit tree is to make a small hole, double up the roots anyhow, stick in the tree, throw in the soil, and ram it hard down as in fixing a gate-post. And the experiments confirm this. Photographs of the roots of trees, after being planted in each of these ways, are given in illustration. The experimenters have no doubt as to the testimony of the facts in favor of their new method. The outcry against them, which has of course been raised, has led them to try to find a scientific explanation in justification of their views; and they suggest that their way of planting provokes a copious formation of new root fibers, which is not the case in the other method. The new roots seem of more value to the plants than their old ones, which latter may even be deliberately broken without spoiling the tree.

Commenting on these experiments on the assumption of their validity, which there seems no reason whatever to doubt, one would say that they point to the conclusion that Nature is worth imitating. The apparent carelessness of Nature, which we propose to remedy by art, is not necessarily so careless as we might think; at all events it is what the plants are accustomed to. Everyone knows that volunteer plants will often flourish defi-

antly to mock our efforts to introduce them artificially. Perhaps we do not fully understand the conditions for success.

This does not mean that man cannot assist Nature, for he can and does, being therein himself a part of Nature or her agent. But he may make mistakes. Horticulture does not seem to be an exact science yet; and the tyro will have to exercise his judgment in deciding how much of what he is told is expert knowledge, to which he should defer, and how much is dogma.

Destruction of the Pigeon

A GREAT ornithologist once estimated the numbers of a flock of carrier pigeons, which he observed, to be over two thousand millions; and Audubon gives a graphic account of the incredible numbers he witnessed in Kentucky in 1813. He counted 163 different flocks in less than an hour and a half, and continued to meet more the farther he proceeded. The air was filled with pigeons, the light of noonday was eclipsed, the dung fell like melting snowflakes, and the buzz of wings lulled the senses to repose. None alighted, for there was no food in the neighborhood.

I cannot describe to you the extreme beauty of their aerial evolutions when a hawk chanced to press upon the rear of the flock. At once like a torrent and with a noise like thunder they rushed into a compact mass, pressing upon each other toward the center. In these almost solid masses they darted forward in undulating and angular lines, descended and swept close over the earth with

inconceivable velocity, mounted perpendicularly so as to resemble a vast column, and when high were seen wheeling and twisting within their contracted lines, which then resembled the coils of a gigantic serpent.

For three days they continued to pass in undiminished numbers; but this bird has been almost extirpated by netting and professional plundering of nests. In New York City, squabs have been sold by the barrel at a less price than potatoes.

Underground River in Montana

NEAR the Great Falls of the Missouri in north-central Montana are some very large springs, locally known as Giant Springs, discovered in 1804 by Lewis of the Lewis and Clark expedition, who described them as the largest fountain in the United States. These springs are on the south side of the Missouri, about three miles below the town of Great Falls, and issue through large joints in a sandstone on the river bank, partly above and partly below the water. This situation makes the flow difficult to measure; but by ascertaining the difference between the volume of flow of the river above and below this spring, experts have calculated the flow of the spring at 638 cubic feet a second, which is more than 400,000,000 gallons a day—a regular underground river. The water is believed to be derived from the sub-river flow of the Missouri that leaves its valley near the mouth of the Sand Coulee and passes down the pre-glacial river-channel.

From THE PRELUDE

WHAT we have loved,
Others will love, and we will teach them how;
Instruct them how the mind of man becomes
A thousand times more beautiful than the earth
On which he dwells, above this frame of things
(Which, 'mid all revolution in the hopes
And fears of men, doth still remain unchanged)
In beauty exalted, as it is itself
Of quality and fabric more divine.

—William Wordsworth

The Keys to Conscious Immortality

AS has so often been said from the Theosophical platform, Theosophy is not only a body of teaching, but a life to be lived; and neither the real truth, nor the beauty of the teachings can become known to the Student until they become through practical application a part of his life.

Is it not true that to most people their real nature is a closed book? They do not understand themselves, neither do they know that the purpose of their existence is a very definite one. For the average man the dark pall of ignorance covers all the vital problems which confront him, leaving him a prey to conflicting storms of thought and feeling. And yet it does not seem as if these things need be, and many in the darkness dimly sense that things are not what they seem, though they know not the reality. What gives them the feeling? Many have felt before they heard of Theosophy that there must be an explanation of the meaning of life somewhere, if they could only find it.

H. P. Blavatsky brought Theosophy to us that we might discover that the keys to the solution of all our difficulties already are, and always have been in our own hands. She restated the two fundamental laws of human development, Karma and Reincarnation and related them to the every day work of our every day lives, showing us too where to look for the keys which will remove the obstacles that hide the Light of Truth from us, and that the veil of ignorance is one of our own weaving.

The keys that unlock the complete mystery of Being so far as evolution on Earth is concerned are seven. Let us consider some of the earlier ones. First comes "charity and love immortal," followed by "harmony in word and deed," "patience sweet that nought can ruffle"; these lead to "indifference to pleasure and to pain," helping us to conquer illusion and perceive truth; with the fifth, given as, "the dauntless energy that fights its way to the supernal Truth, out of the mire of lies terrestrial."

Perhaps when we first hear of them, it seems as if such powers were superhuman and unattainable by mortal man. So they are by mortal man but what is there in that to discourage an *Immortal Being*? Our mortal-

ity is but the husk or shell of the immortal Self.

Let us not think of ourselves as bodies, but as the informing constructive intelligence that lies back of the visible form in which at present we are gaining fresh experience, and facing new opportunities for service of the Supreme Spirit.

Moreover, because in our higher natures we are divine and immortal the seeds of these transcendent powers lie hidden within our own natures as the plan and picture of the mighty oak tree lies hidden in the tiny acorn. In both cases it is a bringing forth of latent potentiality, from hidden depths into the daylight of the work-a-day world. Put your heart into your work, says H. P. Blavatsky's present successor, Katherine Tingley, turning our minds to devotion to humanity as the master-key to successful enlightenment, as it was also the first key given by H. P. Blavatsky.

You will never find the teaching of one of the true Teachers contradict, but rather reinforce, that of those who have gone before, while each in turn gives out a little more of the world-old truth as people become more prepared to assimilate it, through making use of that which they already have. The way to live in line with Theosophy has been clearly pointed out by the three Teachers, H. P. Blavatsky, William Q. Judge, and Katherine Tingley; it only remains for us to play our part, and surely the reward of really knowing the Truth is worth the effort. Shall we not prove by action that it is? W.

Reincarnation and Karma

WITH the revival of the ancient Wisdom Religion, come again the teachings of Reincarnation and Karma with all their justice and their mercy. How complex are the problems of life and how impossible of solution without a knowledge of these two laws!

Karma is the Universal Law which adjusts cause and effect, and through an understanding of it we learn that the contrary conditions in which we sometimes find ourselves are our own making. Its teaching is that we must reap that which we have sown and that even in the reaping we are preparing the harvest for the future; for the way in which we deal with each event produces its own effect and provides accordingly our future karma. But if perchance in the past we have suffered at the hands of others to the extent that they are now at our mercy and we withhold from injuring them, the law is then fulfilled by compassion, eternal justice is satisfied, the debt paid, and they and we are bettered by it.

Reincarnation is the law of rebirth which gives us the necessary time in which to work out our karma, to pass through all the experiences which the soul must have in its onward and upward march to the goal that is set before us.

"Be ye perfect," is a command to all alike, and how with the limited idea of one earth life can this be attained? What chance has the child born in the midst of sin and forced by circumstances to remain there till death, of rising to the purity of soul life, were it not for the Divine in all shining like the sun in a dark cavern and stirring to life thoughts and aspirations which will bear fruit in other lives and will provide a condition more favorable

for the growth of the soul to its full stature.

Reincarnation kindles and supports the idea of brotherhood, for, having lived in other climes and been a part of other nations are we not all bound by ties of kinship? Theosophy is certainly the hope of mankind which is bringing to the world "Truth, Light, and Liberation." And are not our hearts filled with gratitude to those Teachers whose noble unselfish efforts have awakened the world to the dawn of Universal Brotherhood. N.

Friends in Counsel

TO what extent does the world respond to the stimulus of a great life? What is such a stimulus?

To live with unselfish, brave, light-hearted, gentle people, is to bathe in, to absorb these qualities (unless the gloss of selfishness is altogether impenetrable). Can we not trace many of our present simple acquirements of accuracy, painstaking, generosity, to the association with some one who exemplified those qualities notably?

What powerful influences story-book heroes and historical great men all exert; and the personages who at the present hour attain "fame," influence many, stimulating some to emulation, bringing discouragement to countless others. The world's great men are generally of a greatness limited. They are houses with chimneys so wide and high that the entire structure totters and topples, unbalanced.

This one was a scientist who knew more technical names of things (the least of which he never began to understand) than any other living person. He, if you please, was a great man. Some one today will acquire the most wonderful dexterity upon the keyboard of the piano "possible to attain." He may be cruel, hating all rival pianists, wantonly extravagant, self-indulgent, but he shall be the public's darling and go down in the books as a great man.

Yet in our hearts we are not deceived. We know real greatness from this notoriety. The very names of the heroic, the godlike men and women who have served humanity are awakening forces. What is this perfect symmetrical blossom of greatness that so contrasts with our little one-petaled fame? What happens to us through those who have unfolded in the beauty of true greatness? Is anger called up in us, or envy? No. Does it hurt that they have gained so much and we still remain so far behind them? No.

For true greatness is a stimulus, a goad, a stick to drive us forward. If alive at all, we respond to the shock of its contact with higher, broader, deeper living. The purifying process always going on in a healthy organism is quickened and intensified.

The life and work of H. P. Blavatsky was whip and lash to a world lost upon the highway, uncertain of its destination and of the reason for arriving. There is the prick of spurs on every page of *The Key to Theosophy*, *Isis Unveiled* and *The Secret Doctrine*. "Here," your heart says, "was one who knew the remedy for the world's sickness. Why, that which a moment since seemed hopelessly incurable I perceive now to be responding with vigor to this medicine of common sense and great-heartedness. At last I have found what I have been seeking all these years. Here I will remain and be cured and grow strong to help to bring back joy to the world." W. D.

FATE

YOU gave me my work to do, you brought and set it before me;

I laughed with the laughter of one, seeing, who understands;

I bent to the task elate, zeal like a mantle o'er me—

Why did you break my wrists and shatter the strength of my arm?

You gave me the song to sing, and mine the joy of the bringing

Strands of Heaven and sea and earth strung to the perfect note.

Finished, glorious, whole, I raised my head for its singing—

Why did you seal my lips and crush the song in my throat?

The work I was fain to do—it rusts in the drift of the sands;

The song I was fain to sing is waste for the winds to float.

Why did you break my wrists and shatter the strength of my hands?

Why did you seal my lips and crush the song in my throat?

—Theodosia Garrison in Appleton's

THEOSOPHICAL FORUM

Conducted by J. H. Fussell

Question If Jesus did not save people by his death, as the Christians claim, what did he mean by such sayings as "Come unto me all ye that are weary and heavy laden, and I will give you rest"?

Answer What do such sayings seem to mean? There is nothing there about his death, that one can see; by what magical process is vicarious atonement distilled out of it? Why go about to find wild unlikely meanings for what is quite simple really, and straight-forward? Jesus came as a revealer of truth; to remind people of numberless forgotten things. Men had forgotten then, as they have now, the mysteries of the kingdom of heaven; which is to say, they had forgotten how to live; and it was his mission to get that knowledge back to them; to din some few redeeming truths into their hearts, if possible; and hinder the landslide of humanity into materialism and corruption.

Why should he have troubled to frame the laws of life into those imperishable sentences, and proclaim them, if it was some mysterious merit in his death that was efficacious? He was united with the god within him, and insisted that his hearers might become even as he was. "Ye are gods," he said; "be ye perfect, even as your Father which is in heaven is perfect." There was the road to salvation; one which appeals to our common-sense, and wanders off by no side-path into dark mystery. No excuse for half measures; no warrant for the laggard. Be ye perfect; drive out the money-changers from the temple of your heart; live, strive, work, accomplish things. Master your own feelings and all the realm of selfhood; give out love; that was the key to it all. He was the sower that went forth to sow; and has not dogma sprung up and choked the good seed?

An old master painted a picture once, for all the world to see. The lines were simple and majestic; strong, flowing, grand, beautiful. It spoke straight to the soul and evoked whatever was heroic and compassionate.

After a while it fell into the hands of money-making keepers, who set their heads together to devise some plan for getting more

and more people to pay the admission charge to see it. "It is rather poor in ornamentation," said one; "there is not enough red in it to catch the public eye." They took to repainting it here and there; but alas, there were no artists among them. They robbed the subject of his manhood, and made him sickly and hectic and consumptive; "that will appeal to emotion," they said. They gave him ghastly wounds, and put death on his face, instead of life; "the morbid will always draw crowds," they considered.

Then they advertised the miraculous nature of their daub. It was better than a bull-fight, for a sight of it would save men from their sins; and it had the attraction of being gory, as a bull-fight has. "Only look at it, and you are a new man," they cried; "you have nothing to do but to come, and no expense but the small admission fee." "Otherwise you must *work* to get health, bodily and spiritual; a mere sight of this will give you both, and at cost of no exertion of your own." "Very convenient indeed," said the public; "delightful!" "We are too much occupied with business and pleasure to take exercise and do good work. Besides, there is the trouble. Let us go and see the picture." And they found it highly exciting and emotional, and it filled their minds, or so much of them as could be spared from money-getting and pleasure-seeking.

We have a grand mania, we human beings; and that is for short cuts and a royal road. We know well enough that things are not as they should be; *en masse*, we do not believe that all's well with the world—or for that matter, with ourselves. The main part of us, bereft of most marks of our old divinity, have yet a certain unrest and discontent with blank materialism, which proclaims the relics of divinity in us still. We are divine, and once were manifestly so; we are doomed for manifest divinity again. Hence we must have some kind of religion. We must cast out some kind of anchor, hoping it may catch in the divine beyond our personal consciousness. Only the right anchor involves some little trouble in the casting; so we fling out this rubbish and that, whatever comes nearest to hand. We might spare ourselves the pains. Only the right metal will hold.

You want a fine muscular arm? Very well then; go out and do your work. Use it manfully every day; put the urge of life through your muscles; work. Then it shall come to be as strong as ever you need it; strong enough to beat down idleness, and set its mark nobly on all the duties you have to do. Ah, you reply; *but that would take time. I have no leisure for that sort of thing; besides, there is no fun in it. I will take Dr. So-and-So's Muscle-maker instead. There is surely some means.*

There is surely some means, and it is as plain as the broad heaven above; but heaven only knows when you will try it. For the name of the quacks is legion, is infinity; as long as you remain gullible, there will be new ones to gull you when the old ones fail. We can always find something to do that is not the plain right thing; always something to believe that is not the simple, A B C truth. Let us make of Jesus anything but a hero to inspire us and a teacher whom we may follow. Let us jump altogether his sound, sane philo-

sophy of right action; and load our souls down with emasculating mysteries and dogmas. Let us have a short cut to salvation, a back-stairway into the kingdom. *Who hath bewitched us; who hath bewitched us?*

"Come unto me, all ye that are weary and heavy laden, and I will give you rest." The cry of compassion in all ages. He knew that whosoever drank of the clean fountain of his teachings, and followed the path he pointed, would come to the end of all weariness, and the immortal "freedom to act and help." He had become one with his Divine Self, and might speak for the Divine Self everywhere. What is that light, which "lighteth every man that cometh into the world"? Men, we are sparks of the Divine Fire! Our essence is not limited and did not begin in time; our light shone before the worlds were made.

These personalities which were born and are to die are not ourselves, but only a kind of garment that we wear; and this is the most ancient teaching in the world. They are the branches, but the True Vine is the Spirit. Is there no reaching out to and becoming one with That? Do we not know the moments of heroism and compassionate thought? Have we no knowledge of unclouded heroes, whose actions were all godlike and luminous? Do some little deed selflessly, and see what glow kindles within you. W. M.

IF we step outside the little circle of creed and consider the universe as a whole balanced by the exquisite adjustment of parts, how all sound logic, how the faintest glimmering sense of Justice revolts against this Vicarious Atonement! If the criminal sinned only against himself, and wronged no one but himself; if by sincere repentance he could cause the obliteration of past events, not only from the memory of man, but also from that imperishable record, which no deity—not even the Supreme of the Supreme—can cause to disappear, then this dogma might not be incomprehensible. But to maintain that one may wrong his fellow-man, kill, disturb the equilibrium of society, and the natural order of things, and then—through cowardice, hope, or compulsion, matters not—be forgiven by believing that the spilling of one blood washes out the other blood spilt—this is preposterous! Can the *results* of a crime be obliterated even though the crime itself should be pardoned? The effects of a cause are never limited to the boundaries of the cause, nor can the results of crime be confined to the offender and his victim. Every good as well as evil action has its effects, as palpably as the stone flung into a calm water. The simile is trite, but it is the best ever conceived, so let us use it. The eddying circles are greater and swifter, as the disturbing object is greater or smaller, but the smallest pebble, nay, the tiniest speck—makes its ripples. And this disturbance is not alone visible and on the surface. Below, unseen, in every direction—outward and downward—drop pushes drop until the sides and bottom are touched by the force. More, the air above the water is agitated, and this disturbance passes, as the physicists tell us, from stratum to stratum out into space forever and ever; an impulse has been given to matter, and that is never lost, can never be recalled!—H. P. Blavatsky, in *Isis Unveiled*, II, 542

THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY

FOUNDED AT NEW YORK CITY IN 1875 BY H. P. BLAVATSKY, WILLIAM Q. JUDGE AND OTHERS
REORGANIZED IN 1898 BY KATHERINE TINGLEY

C e n t r a l O f f i c e P o i n t L o m a C a l i f o r n i a

The Headquarters of the Society at Point Loma with the buildings and grounds, are no "Community" "Settlement" or "Colony." They form no experiment in Socialism, Communism, or anything of similar nature, but are the Central Executive Office of an international organization where the business of the same is carried on, and where the teachings of Theosophy are being demonstrated. Midway 'twixt East and West, where the rising Sun of Progress and Enlightenment shall one day stand at full meridian, the Headquarters of the Society unite the philosophic Orient with the practical West

Apollonius of Tyana

APOLLONIUS of Tyana has always been something of a difficulty to the Church historians. They have never been able to make him non-existent, nor a personification of the dawn, nor a solar myth. They do not like to dwell too much on the slightness of contemporary mention of him because of the still slighter mention of the reputed founder of their Church. It will not do to represent him as a pure impostor, for throughout his long life he persistently preached the loftiest ethics, traveled as a teacher through most of the then civilized world, did his utmost to purify the old creeds from their impurities, and did not hesitate to reprove even Roman emperors when he considered their conduct reprehensible. So great became the contemporary reverence for him that after his death a temple was raised to him; for four centuries he was worshiped with divine honors; and a statue of him was placed by the Emperor Hadrian among those of the gods.

A new life of him (already alluded to in these pages) has just appeared: *Apollonius of Tyana, a Study of his Life and Times*, which may possibly revive some of the old controversy. The publisher calls it a *ballon d'essai*, an experiment in present public interests, remarking in his preface:

In the following pages Dr. Campbell has sought to recover Apollonius of Tyana from the dust of controversy, and to picture him as he existed in the minds of his more reverent and spiritually minded believers. How far such an Apollonius is identical with the mage, who was certainly born in Tyana, or how far he is a literary fiction, or how far he is an ideal saint sublimated from the rarest aspiration of the finer spirits in that pagan society which Christianity had begun to leave—these are polemics from which Dr. Campbell has purposely abstained.

My nation is the greatest on earth—because it is *Mine*, because *I* belong to it. My religion is the only complete presentation of Truth that humanity has ever had. My spiritual Teacher is the only Son of the Eternal Light that has ever appeared; those Teachers who appeared before him were but well-meaning gropers in the darkness; those who appeared *with* him at that most critical period of Western history, *e. g.* Simon Magus and Apollonius, assisting him by appealing to other groups and strata of society than those he reached, preaching the same doctrine, the same

MEMBERSHIP

in the Universal Brotherhood and Theosophical Society may be either "at large" or in a local Branch. Adhesion to the principle of Universal Brotherhood is the only prerequisite to membership. The Organization represents no particular creed; it is entirely unsectarian, and includes professors of all faiths, only exacting from each member that large toleration of the beliefs of others which he desires them to exhibit towards his own.

Applications for membership in a Branch should be addressed to the local Director; for membership "at large" to G. de Purucker, Membership Secretary, International Theosophical Headquarters, Point Loma, California.

ethics, doing for the same reasons the same wonder-works, giving like him their lives to their work—were imposters.

It is this spirit, manifested from the very first, that has made the Higher Criticism so menacing. If Christians had recognized that the Divine Light, the whole body of Divine Truth, the whole transcendental doctrine of being and its application in ethics and aspiration, had always and everywhere been pressing in upon the attention of men; that from time to time one arose whose purity and moral power enabled him to receive it in its fullness; and that these forthwith preached various appropriate aspects of it to various times and peoples, the total doctrine remaining one;—their Teacher would have been seen in a setting that could not be tampered with. To establish the phenomenon in men's minds as *unique*, was to ensure final incredulity. To have shown it as in line with the rest, all flowing from never-failing Divine Compassion for all men, would have been to ensure the permanence of its acceptance. The collective egotism, intolerance, and historic ignorance of the Church is now reaping its fruit. It has libeled Divine Compassion. It treated as an aberration that truth which Augustine unexpectedly shot into the midst of his aberrations—that the Christian religion, *though under other names*, had been in the world since the world began. It is in the world now, *in spite* of the Church, and the Church will have itself to thank if it is called by another name.

STUDENT

Religion vs. Irreligion

FROM the *San Francisco News Letter* we gather that a preacher has stated, that:

Among the 7000 students in the colleges of the Golden State there is not enough religion to save a rat. . . . Irreligion is rampant among the colleges in California, and something must be done to save the students from the devil. I will venture to state that there are more saloons in California than there are Methodists. And yet we are going to turn the west over to the northern ministers. We should do as well to turn it over to the devil.

To this, five pastors of the denomination issued a statement refusing to believe that the report of the preacher's having said this could be correct, and regarding it as a libel. But this newspaper says it is true.

The *News Letter* submits that it agrees with the preacher and that the preacher has unwittingly pointed out the reason why the manhood and womanhood of California is so virile, active, truthful, honest, practical, kind, and in a general way of better class than any like number of people in any religious community on earth. . . . It is yet to be proven that the spread of any religion—be it any of its "fifty-seven varieties"—has made people good or useful.

And it even adds that, if there are fewer Methodists than saloons, this also may have something to do with the large amount of virtue extant. (?) One cannot suppose that this is meant in praise of the saloons!

The fact that poor religious teaching has force and continues to maintain its hold in spite of its wrong doctrines and undesirable effects can only be explained on the theory that it is a perversion of something that was originally good. If it did not have this seed of force in it, it would soon be done away with. But because it has this seed, it is able to retain a hold on people's minds. Religion fills an indispensable need; and if there is no good and true religion, then perverted forms of religion will occupy the throne and wield the scepter.

The undesirable effects attributed to this kind of teaching are not to be wondered at if we consider some of the doctrines. The doctrine that man has no power to effect his own salvation, but needs intercession; that he is full of inherent sin but has no inherent goodness; that the exercise of his intelligence and initiative leads him away from the light: such doctrines as these may well tend to take away self-reliance and virility. The connexion of certain forms of religious teaching with hypocrisy is well known. When man ceases to rely on the goodness inherent in his own nature, and expects instead sanctification by some external power, the source of his manhood and uprightness is sapped.

Men are feeling that the source of light is within themselves and that the churches have nothing to give them that can satisfy their real need. For how can a narrow, dry, musty, time-worn creed head the march of progress and inquiry? It is like trying to harness a crawling wagon to Pegasus. E.

THE THEOSOPHICAL ADDRESS AT ISIS THEATER

"WELL! one always gets something at these meetings"; was the remark overheard at Isis Theater last Sunday evening. "At least it makes you think and stand on your own feet"; was another. "It isn't only what is said, but the decorations, the music. . . ." "Do you have these quotations and little bouquets every time, and the flowers on the stage; where do they all come from?" was asked of one of the ushers. And a hundred other remarks might be recorded to show the interest that is taken in the Theosophical meetings at Isis Theater.

Last Sunday Mr. Kenneth Morris gave an address on the subject "Some Evidences of Theosophy."

The only difficulty that confronts us, he declared, is to find some place in which these evidences are not. The whole world is full of them in its literature, history, science; and above all things our own lives are crowded with them from the cradle to the grave. This is extremely natural, for what underlies the whole surface of the universe is sure to be peeping out in a thousand places.

Considering first of all the evidences that most stare us in the face, the speaker referred to the infinite gradations of destiny and character which exist, no two out of the billions of people on this earth being exactly alike.

If we study the formation of character we are forced to the conclusion that heredity will not account for it, for if we accept that, it takes us only another step, and then we have to explain heredity. Only the Theosophical teaching of Reincarnation will explain character and the circumstances of life. From the very morning of our lives we find ourselves confronted with old engagements to be fulfilled and old debts to be paid; also reimbursement to be received for old expenditure. We are born of such and such parents, into such and such a circle of friends. Shall we say that we are fulfilling no engagement, that these people are nothing to us? All these things can be answered alone by Reincarnation, and are evidences of it. There is no getting something for nothing. It was we who did the ill thing for which we are punished; it was we who did the good thing for which we are rewarded.

Sometimes we talk glibly about that mysterious thing evolution or progress, which will right all wrongs, and make human life throughout the world excellent and desirable. But evolution is altogether a care of our own, a matter for ourselves to attend to. It is as our love directs it, and our will compels it, and our hands build it day by day.

Fact shows us, and history shows us, what astounding, grand possibilities there are lying hidden within us; and are these not evidences again of the teachings of Theosophy? Each human being, says Theosophy, represents a soul, which is a spark of universal divinity, a radiation, as you might say, out from God.

Theosophy sees no miracles anywhere, but only eternal law bringing seed to fruition. The seed was action, patient striving against the lower nature, unremitting effort; and the fruitage shall be a new heaven and a new earth; mankind grown perfect, and free, and devoid of suffering.

OBSERVER

My Neighbor's Immortal Soul

A "SATURDAY NIGHT THOUGHT" in the *Boston Transcript*, contains the following reflection:

It is well for us to think of our neighbor's immortality rather than our own, because it helps to keep us from the stupidity of contempt. It is well also because it puts immortality in the dry light of unselfishness and enables us to see that it is an opportunity of growth and not merely a gratification of the desire to live on any terms at all.

It is to the press, with its Saturday thoughts, and not to the pulpit, with its Sunday thoughts, that we must go for gleams of common-sense and helpful advice. Is this thought to be classed as religion, or as what? one wonders.

Yes, it is true that we have been using that word "immortality" to mean *my* immortality; and it is to be feared that the pulpit has too often encouraged that meaning. How many, on being told of immortality, think first of their neighbor?

The paper continues that we are wrong to believe our neighbor hopelessly shallow. His development may be arrested; but if we are immortal, so is he, and there is *endless room for growth*. Endless room for growth! This does not sound like the church teaching about immortality; according to that, our neighbor will be cut off short in midcareer with his growth still stunted, and relegated to an abode of bliss (or otherwise) where any future development he may undergo will not count for anything on this earth. This writer appears to believe in the perpetual progress of man as a human being, not merely as an angel.

He whom we are tempted to scorn on account of his apparent failure hitherto, is also a child and pupil of the eternal life. He may be only like the century cactus which spends years on years in getting ready for a conspicuous blossoming. He may be asleep, and run so fast on his awaking as to outstrip our measured steps. In any case, we are not done with him as we pass by with averted looks. Again and again in the course of the long journey our paths may cross and there be room for interest and kindly greeting. Our contempt hinders us more than it hurts him. God, at least, is interested in his life and learning and would have us remember the enduring brotherhood of man.

Clearly the above makes nonsense according to the ordinary religious or scientific theories of life. There may be some dullards who blossom out in later life, but in most cases the initial handicap is not made up. But accept the belief in Reincarnation and the remarks become sensible. Each human life is but a single stage in the Soul's career. When next our Soul disguises itself for a new part on the stage of life, it may be ordained to wear the humble garb which our neighbor is wearing today; while he, having discharged that role faithfully, may be called to a higher part.

Side by side with the doctrine of immortality, as this writer evidently feels, goes the doctrine of solidarity. The doctrine of the immortality of Souls involves the doctrine of their unity. Separateness is a delusion when thought of in connexion with Souls; and it makes nonsense to try to reason on that basis. Hence my Soul and my neighbor's Soul—or, to speak as a Theosophist would, and to avoid a religious misconception—my real Self and my neighbor's real Self *are One*. I cannot venerate my own Soul without venerating his; that which I regard as exclusive property *cannot* be my Soul; it is some other

part of my internal economy, my self-love; if I try to save it, God may give it to "Satan to burn"—for my good.

This recognition of the Soul means unaffected charity to my neighbor; for it means that I realize his absolute unity with myself. That which in him is struggling to manifest itself is the same as that which is striving to manifest itself in me. But this is no sentimental brotherhood, no pandering to weaknesses. Discrimination is also a virtue, and the good offices of a true friend are sometimes best shown by methods that may seem cold and harsh. But we must not be impatient, for the duties of true friendship are no easy lesson to learn, and wisdom is not to be had for the mere asking.

But is it not remarkable how the great fact of the solidarity of man is forcing itself to the fore, and not through the channel of religion but outside of religion? This is evolution—evolution of man's mind by the influx of a Spiritual power. Man is learning to know himself and is awaking to the fact that he is potentially a God.

Perpetual Lamps

THAT lamps could continue to burn perpetually without exhausting their fuel was a popular belief in ancient and medieval times; and numerous stories are related of such lamps being found burning in old tombs when opened. The admission of air extinguished them, and they burned best when air was totally excluded. The fuel to be used, said the alchemists, was oil of gold, prepared from the precious metal and very costly.

One ingenious modern scientist explains the stories by saying that when tombs are opened, the vapors of decay burst into spontaneous ignition, and the presence of the (unlighted) lamp would aid the imagination of the finder to deceive itself.

Sceptics will find it easier to believe in the perpetual lamps than in this theory. There is no proof that such lamps are impossible and a good deal of testimony in favor of their actuality. Might one be permitted to suggest that they were something like radium lamps? Or perhaps some ancient civilizations, having had a few more thousand years to run than ours has, had discovered something even better than radium. Light is a frequent accompaniment of combustion, but there can be light without combustion. Electricity may be the source. In matter there is virtually unlimited latent energy, and this might supply the source.

The perpetual lamp was also a symbolical term; for the alchemists used these expressions both literally and symbolically. In this sense it means the quenchless ever-shining light of the Soul, which needs no fuel from the passions. The illuminated Sage is the "light of his own thoughts" and is not dependent on the ordinary sources of happiness. How to attain this eternal contentment and ever-shining wisdom was one of the objects of alchemical quest; and the allusion to pure gold shows the connexion with other branches of alchemy, gold being the symbol of wisdom.

Another thing about these old alchemical recipes is that it required of an individual certain personal acquirements to make them succeed; others who have tried to follow the

directions have failed. For while no special qualifications are necessary for the handling of the gross physical forces of nature, it is otherwise with the subtler forces involved in these alchemical operations. We recently had a hint that science may be approaching this border line, in the so-called "Blondlot rays," which could be seen (as was said) by Latin races but not by Teutonic. The alchemist had to be "fit" in a very real sense, and had to prepare himself by abstinence and clean living.

But what an ideal for the storm-tossed philosopher, weary of his thoughts, that of the perpetual lamp burning silently in the depths of his soul, like a priceless jewel in some mountain cave. The Divine Spark, latent in all humanity, denied and rejected by both religion and science, recognized by the wise men of old. The first step is to recognize that it is there, not only in me but in my brother man. The denial by man of his own innate divinity is surely the greatest of sins.

STUDENT

It Was not All a Dream

THERE is an old German story of a man who dreamed that he had become a god.

He thought his old garments fell away from him and that he moved clothed in light. For him the sun shone with a new and extraordinary glory. The air was alive with light and was filled with scents and with soft melodies as it blew gently amid the trees and houses. As the stars rose he could hear their silvery tones. It seemed to him that he knew now what life was for, what an inexhaustibly splendid possession it was, and how limitless its possibilities. He also saw that it could never end. The stones in the road glittered and pulsed with life and joy; the blades of grass were jewels and the trees were crowned with tiaras of gorgeous color. He saw that every atom of the stones and every blade of the grasses and every bush and tree, was a life, a living, conscious, joying thing, moving through the days and years and ages up toward a manhood like his own. He saw that as he passed near them and the light of his robe of light fell on them, and especially when he actually touched them, they pulsed and thrilled with an added joy, and merely for that gained one sudden step of their growth manward and godward.

And then he saw that as he passed people in the street they looked wonderingly at him. They could not see his robe of light, but they felt it. With their dim vision he appeared to them as still clothed like one of themselves.

But then he found that if he stopped and spoke with and touched any of them, such ones awoke into gods as he had awaked and saw and felt all that he saw and felt. With him they lived on a new earth which was yet this one, and looked into a new heaven through the blazing lens of the sun. They still did the common duties of earth, but in a new way, better, completer. And they lived now as it were two lives, one beside or within the other, one of heaven and one of earth. Then he and they, filled with an immense brotherhood and compassion, went about touching as many as would let them; until at last all the world was awake, and the old things had passed away for ever. . . .

But suddenly the dream ended and the

dreamer awoke. Yet he would not be denied of his dream. He said:

"This life which we call waking, this is the dream. That which I dreamed was the true, the real. We, gods, move dreaming among shadows and are clothed with shadows and think phantoms. Yet we *are* gods, however thickly veiled and however heavily dreaming, and sometime we shall all awake into that new light and life whereof I, dreaming, partook for one long short hour."

STUDENT

"Jesus"

A BAPTIST churchman, whose recent book on "The Finality of the Christian Religion" has raised a storm by its broad and unorthodox views, is reviewed in a daily paper under the heading:

Orthodoxy Gets New Jolt. Chicago University Professor says Men will be Better when Jesus is Forgotten.

He means the fetish called "Jesus" which we have created, consisting partly of an imaginary historical character and partly of a graven image of the imagination. Some, like Tolstoy, have tried to model the modern world according to their idea as to how the Jesus of the Gospels would have modeled it. But this writer maintains that Jesus, if he came today, would adopt a very different policy. Of course he would; he would adapt himself to the true needs of these times, as he doubtless did to the needs of those times. If we accept the Gospel narrative, we must admit that the disciple who repudiated his Master while that Master was alive and needed his help, became a most zealous Christian directly after the Master's death, and was supported by a number of influential members of the community that so opposed him during life. Even so, it is always easier to worship a dead hero than a living one. Nelson, the British symbol of duty, is relegated to the top of a very high pillar; but if he should ever come down and lay his rope's end about him, he would not be so popular. Similarly, it may be opined that if the gentle Jesus were to appear suddenly in our midst, he would not be so easy to get on with as is the Jesus of the revival meeting or the smug middle-class hearth.

We have turned Jesus into a soothing-syrup or poultice, and the name stands for ideals the reverse of manly and self-respecting. There are a few simple pure natures to whom Jesus stands for the emblem of their own unselfishness and piety; and it would be wrong to disturb them. But on the whole the ideal which the name stands for is one that we should do better without.

If the founder of Christianity were here today, he would certainly stir men to action, and remind them, as of old, of the Divine Spirit in their breast and of the obligations which it imposes on them. He would preach the path of Knowledge and Enlightenment, by the awakening of the Soul's faculties, and not a set of debilitating dogmas and a life of useless resignation. Men would try to hustle him out of the way; and after he had gone, they would take his teachings and transmogrify them into a convenient system. Even so some so-called Theosophists have tried to do with the teachings of H. P. Blavatsky.

The awakening of conscience and the sense of responsibility, which is so marked a feature

of recent times, is not centering about religion but about civic duty; it is tending to reform religion rather than to be promoted by it. It is always the innate goodness of man that comes to the rescue; that is, it is the real Christ, not the imaginary Jesus. H. T. E.

The Power of Mind

NINETEENTH century thought emphasized matter, even seeking to regard it as prior to mind, and to explain mind as its product. Twentieth century thought is swinging the opposite way; now the tendency is to regard mind as supreme, and matter as a product of mind. The mental science movement takes for its axiom "That which I think, I become," and preaches that we should create our own conditions and accomplish our own wishes by a powerful effort of thought.

Thus mental science resolves itself into a strife of wills, a battle of rival self-assertion. Its preachers do not seem to realize that other people have wills and thought-powers, and that their efforts may act adversely to one's own. The whole question turns on whether we are selfish or united. Clearly anyone using the power of thought or of self-assertion in his own exclusive interests will come into conflict with other people, like any other kind of self-seeker; and he must either be beaten or else win by superior force.

But perhaps most people who go in for mental science propose to themselves not to be aggressively selfish, but merely to promote their own health and peace of mind in a harmless way without interfering with others. In this case they are cultivating a milder form of selfishness, but it is selfishness still, and will contract the nature. And there is this difference between their case and that of the person who does not pretend to use higher powers — that they cannot stop short on the middle ground as he can. The reason is that these powers, though good servants, are bad masters, and once aroused will not lie quiet, but have to be controlled, or they will control.

The dangers with which society is menaced by a general diffusion of knowledge concerning the power of thought are obvious; for society contains many unscrupulous elements who would not hesitate to use this power detrimentally. But there is also grave danger to those who propose to use this power innocently. The danger to them lies in the fact that the power to be evoked is so little understood, and that an untrained person can set no limits to its possible effects when once aroused. This current of vital electricity which we so rashly turn on will become the agent of any desire-forces which may lie in our nature, giving them tenfold more strength; and thus the balance of our self-control will be overthrown. He who presumes to summon to his aid occult forces *must be prepared to handle them*, as presumptuous would-be magicians have often found out; for the "genii" do not serve man for nothing, unless he can command them.

These are the reasons why it is so necessary that there should be a movement like the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY, which inculcates pure ethics as essential to the would-be occultist. The Theosophist has to learn first to subdue the demons of pride and selfishness and lust, before he attempts to awaken the powerful hidden forces of nature.

STUDENT

Art Music Literature and the Drama

The *Morte D'Arthur*—Part I

IN certain lines of the *Morte D'Arthur* Tennyson undoubtedly reached his very high water mark of poetry; nor is it easy to see how words could be coined into greater splendor. But there is in it a strange duality; and nowhere can be better seen the contrast between his greatness and the influence that kept him from supremacy.

He ought to have gone right into the heroic world, and let nothing jar upon its mystery and high glamor; or else have left us in the Nineteenth century, to feed on what of poetry our own days contain. In every age, presumably, something of beauty may be found; for there is human history there, and the world-soul is still busy; but it is not well to mix two unsimilar ages. Shakespeare achieves the deeper unities, because all that he wrote is essentially of his own time. Macbeth, Coriolanus, Shylock, and Pericles belonged all to the same world; they might have rubbed shoulders and no one would have been the worse for it. Neither ancient and mystical are they, nor yet modern and personal; but of the middle time of broad actions and simple motives. Broadly speaking, he used no magic nor recorded unmixed heroism; but his men are not trivial nor without meaning. Hamlet, indeed, has a touch of modern personalism about him; he was born into that middle world, yet is aware of, and reaches out curiously into, this present one; from which fact arose his troubles. Lear lived some five centuries before Arthur, and was of the same Celtic race; but Arthur inheres in a region far more titanic and arcane; he is the more ancient by thousands of spiritual centuries. For Lear, no more than for any of Shakespeare's people, did ever an arm

Rise up from out the bosom of the lake,
Clothed in white samite, mystic, wonderful.

All human records might be divided into four planes, or epochs according, partly to their antiquity, and partly to a kind of inward or natural antiquity not dependent upon time. First came the Gods, then the demi-gods, then Men, then modern men. In the first period Pandora had not opened her box, and Saturn reigned in Italy. All is sunlit and beautiful; no one has begun to dream about personality. Among the demi-gods, who succeeded the Gods, there is pure beauty still, and even more of majesty; but the sun grows clouded toward the end. Huge errors are made, involving titanic dooms and the ruin of grand sovereignties; there is no personality, nothing of what we call the brain-mind; no analysis of character nor subtle shading; but hell is at war with the demi-gods, and the first notes are sounded that pre-sage the victory of hell.

The period of Men is to be found recorded in Shakespeare, in Froissart, in Plutarch, and Livy. Here the tone is entirely different; there is action in plenty, character too, but

with broad and simple motives for the most part. No incomprehensible, primeval lights play upon the scene, nor yet chaotic gloom and ruin. The hero walks not so natively here. Some call comes to a man indeed, and makes him a hero, lifting him above his fellows; but then he is a hero for some definite end, which we can perfectly understand, whereas his predecessor was hero from birth and by divine right. The demi-god was born great, while the Man only attains greatness. The former might be known by such old-fashioned titles as "high-minded children of glory"; but you could not call their successors so, or it would sound like burlesque.

ALFRED, LORD TENNYSON

As to the modern man, he flowered in the last century; the Victorian writers are full of him, except perhaps Dickens, who draws mainly from a broader type. His motives are love, politics, business; his character is in infinite shades and gradations; he is essentially a personality, and that is the sum and total of him.

Gods may merge into demi-gods, and Men into modern men; demi-gods, too, may merge into Men, but there is a wider gap. But you cannot mix Gods with Men, nor demi-gods with moderns, without some signs of farce, or at least weakness, appearing. Hamlet, in the age of Men, is half, as we said, a modern. His character is mixed and shaded, bad and good; while those around him are almost wholly bad or good or neutral; his motives and perceptions are legion, while theirs are single and clear. Macbeth in the age of Men is overshadowed by something from the age of demi-gods; the three Weird Sisters are of

the elder times; there is just a touch of incomprehensible and chaotic night; he moves forward somewhat spaciouly to his doom. Both of these situations might have had perils for lesser artists than Shakespeare; his supreme genius makes them sublime. Yet even he could not do the like always; and indeed, we may say he shows some aversion for demi-godhood. He introduces a full-blooded demi-god, "at whose nativity the front of heaven was full of fiery shapes," into *Henry IV*; caricatures him a little, confronts him with that type of the younger time, Harry Hotspur, and laughs at him. Then, too, how contemptible he made Homer's demi-gods by reducing them to mere manhood in *Troilus and Cressida*.

Now the Celtic stories, like the Scandinavian, mostly belong to the age of demi-gods. Thor and Odin strive, and the Twilight of the Gods impends over them; Baldur the Beautiful is foredoomed to be slain—marks rather of the demi-gods than of the Gods, who neither strive nor sweat, and for whom is no storm nor lightning. Here indeed, we speak but roughly and with imperfect knowledge; for the Gods always precede the demi-gods, and where you find the one, you may argue the late presence of the other. Then Ireland has her Tuatha de Danaan, and Wales her Children of Don, who are all clearly of the elder, sunnier time; but the Arthurians and the Fenians and the Knights of the Red Branch are certainly demi-gods. Camlam was awaiting Arthur, and Gavra, Finn; Cuculain was to war upon the waves or on Clan Cailitin, and die. It was the *trouveurs*, who came with the Normans into Wales, who changed Arthur into a smooth, strong, comprehensible man like their own masters; they and their continental contemporaries robbed him of all his pagan and glamorous splendor. Of all, that is, but a little; which little, Tennyson, great poet that he was, had the instinct to catch, and breathe into the setting of that one poem, the *Morte D'Arthur*. KENNETH MORRIS

Native Music of Algiers

IN Algiers a native musician has begun the carrying out of a plan whereby he hopes to awaken a new interest in music among the poorer classes. It is announced that he will soon institute free evening classes in music for young people, on two nights providing instruction in Arabian and Moorish vocal music, and on the remaining nights in the use of native instruments, among them the kouitra, kamendja, and snitra. This will doubtless be a strong factor in preserving to posterity the native songs, now seemingly threatening to become extinct. There can be no arguing the question as to whether Europe has a musical message for the Orient, but that does not compel so many to depart from middle lines, and it is to be hoped that the effort of this Algerian musician will be sustained. STUDENT

Human eyes look down from heaven; human ears are listening at the wall. Speak thou no calumny.—*Japanese Maxim*

A Quiet Hour

A SUNSET hour in solitude—the body somewhat weary, but the mind alert and holding firmly the thread of duties not yet completed—an hour in which to gather sweet influences about and strengthen oneself to finish, in the spirit they were begun at dawn, the daily tasks. Here is an opportunity for refreshment and readjustment, an interval during which to sink deep into one's own heart, find there the true companion, and then, serene and forceful, proceed to get back of all the doings and the speech included in the day's experience. Strong in the peace that comes from a few moments of tranquil self-communion, it is possible to shatter any obstacle that has arisen between oneself and others, any barrier of misunderstanding, any wall of distrust or suspicion.

The Self in the heart always knows how to deal with these temporary obstructions. This enlightened companion always points to the reality behind the personalities that seem to reflect delight when they can mock or dominate us. And when the merest glimpse of the true self of another is caught, how quickly the false semblances of that self are dissolved, and with them any sensitive feelings that may have been aroused by the antics of that lower aspect of one we know to be striving as we are ourselves. . . .

A few moments only of my hour gone, and with them all haunting evils. Now I am free! My need is to draw closer to me the great ideal of service to humanity, the purpose, so compassionate and far-reaching to which I have dedicated myself. To work, with the imagination! open the heart in longing to serve more fully. Picture more efficient service—service not diminished in its compassionate power by lack of discrimination. Picture not failure, but success in overcoming the slowness and weakness of response to calls of duty. Generate gladness. Let me find the heart-companion. Let me get on good terms with

the part of me that wills progress. Oh, what a world we have within, what richness to draw upon, if only we live that we may give rightly!

The sweet influence of the sunset hour is all-encompassing. How many, some known comrades of mine, some unrecognized, earnest,

THE KINGLIEST KING

HO! ye who in a noble work
Win scorn, as flames draw air,
And in the way where lions lurk
God's image bravely bear;
Oh! trouble-trying and torture-torn,
The kingliest kings are crowned with thorn!

Life's glory, like the bow in heaven
Still springeth from the cloud;
And soul ne'er soared the starry seven
But pain's fire-chariot rode;
They've battled best who've boldest borne,
The kingliest kings are crowned with thorn!

The martyr's fire-crown on the brow
Doth into glory burn;
And tears that from love's torn heart flow
To pearls of spirit turn.
Our dearest hopes in pangs are born,
The kingliest kings are crowned with thorn!

As beauty in death's cerement shrouds,
And stars bejewel night,
God-splendors in dim heart-clouds,
And suffering worketh might,
The mightiest hour is mother of morn,
The kingliest kings are crowned with thorn!

Gerald Massey (Selected)

faithful souls, are watching this very sun as it sinks from view. Contemplating the great purpose—service to humanity. How near seem all faithful, earnest souls. Solitude, did I say? Nay, an hour of richest, full companionship with all in harmony with the Law. An hour of spiritual adjustment and soul-growth, when the follies of the lower mind disappear and the Higher Self wills. STUDENT

A Sign of Real Progress in China

AT a time like this, of increasing facilities for the satisfaction of the merely sensuous cravings for aesthetic and bodily luxury, and when "plain living and high thinking" is getting submerged in complex living and loose thinking, and when our so-called "progress" is driving an ever-increasing proportion to suicide or into the cancer hospital or the lunatic asylum, it is pleasant to find a few examples of real progress. In China and Turkey, two of the apparently stagnant countries, the new force of Liberation—whose release has been one of the most surprising phenomena of the New Cycle—is producing substantial benefits for women; though, of course, our satisfaction is mitigated by the thought that there should be the need for strenuous efforts in those countries to obtain the simple rights for women which we believe are the natural heritage of all human beings, irrespective of sex; viz., education, and the liberty to move freely in society, to choose their own course in life, to own property, etc.

But we must not be too critical about other peoples' limitations, nor boast too freely about our own splendid conditions, for it is only recently that the most civilized nations of Europe have allowed woman to take something approaching the position of independence that she held in ancient Egypt, five or ten thousand years ago, and there is yet plenty to do.

The awakening of the Chinese woman to the greater possibilities of life is being immensely helped by the existence of an excellent daily paper, the *Peking Woman's News*, which was started three years ago, and is said to be, on its own lines, without a rival in the world. The paper belongs to a philanthropic Chinese widow of fortune and culture named Chang, who has traveled in many parts of China and possesses an unusually wide experience of affairs. She is not a Christian, nor has she had much contact with the various conflicting creeds which represent the

simple teachings of Jesus to the "heathen" in strange dogmatic forms which would have astonished that great Teacher.

An American lady, in giving some details of Mrs. Chang's career, says:

She is womanly and refined in manner. Her unbound feet, evidently at one time compressed, prove that she practices what she preaches when she urges upon all women the duty of walking upon "heaven-given" feet instead of "lily feet." . . . Her face, though plain, shines with modest fearlessness, intelligence, feeling, and benevolence.

Mrs. Chang's present aim is to arouse public opinion in favor of women's education and elementary rights, and against the feet-binding custom and the opium habit. The editorials in her paper are frequently contributed by other advanced Chinese women, and reflect the stirring aspirations and ideals that are so rapidly coming to the front in China. The articles are said to be generally written in a luxuriantly Oriental style, well garnished with metaphor, which would hardly be expected from the impassive appearance of the race.

Mrs. Chang rightly believes that the future of humanity depends largely upon the women and the girls, the home-makers, so that their education, on broad practical lines, including such things as hygiene and physiology, is the most urgent need of China. The tone of her journal is very high, and the enterprise is particularly interesting and significant inasmuch as it is not an artificial exotic, bolstered up by some foreign missionary board, but is the spontaneous and vigorous representative of a vital urge coming from within. It is reassuring and a proof of great changes in the Oriental point of view that such a paper can be published and supported at all.

The student of Theosophy well knows that all reforms, to be effective, must come from within, and undoubtedly the re-incarnation of China's ancient grandeur becomes a far likelier possibility in view of the tremendous upheaval in thought and policy that is taking place in its home affairs before the wondering gaze of the rest of the world. The heroic effort of this Chinese lady (whom the missionary would have to classify as "benighted" and a "heathen"), to elevate her sisters, and through them the children of China's future, deserves our warm congratulation and respect. That her efforts will result in opening even undreamed-of avenues leading to the re-establishment for Chinese women of their true status as it was in ancient days, we may feel assured, for she is working along lines of harmony and progress, with the Higher Law and not against it. STUDENT

Jane Welsh Carlyle

HOW much Thomas Carlyle (a glimpse of whose mind and heart was given in the preceding issue of the CENTURY PATH) owed to the unselfishness and devotion of his wife no one can estimate. Jane Welsh was a woman of rare literary gifts which she quietly buried in order to feed the flame of her husband's genius during the forty years of their life together. Besides this she brought him—a poor and then un-

Long, long years ago she took her place by the side of a poor man of humblest condition, against all other provision for her, undertook to share his lot for weal or woe; and in that office what she has been to him and done for him—how she has placed, as it were, velvet between him and all the sharp angularities of existence—remains now only in the knowledge of one man, and will presently be finally hid in his grave.

Mr. Conway says of Carlyle further:

For a year, or nearly two, after her death it was as if the world had become to him a realm of shadows. The fineness of both his memory and his judgment seemed blunted, and many of the persons he had known, and used to describe with interest and discrimination, were, if mentioned, brushed away like flies—mere annoyances to a heart trying to find silence and repose in the grave where it lay with his lost treasure. After a few years he rallied from this condition somewhat; but he was never quite the same man again, unless in exceptional hours.

After his wife's death the estate of Craigenputtock, hers, fell solely to Thomas Carlyle as the wife had no other living kindred, and this in his will Carlyle left to the University of Edinburgh for the endowment of ten bursaries or scholarships, these to be known as the "Jane Welsh Bursaries." The will opens with a tribute to his "dear, magnanimous and inestimable wife, for whose sake and in memory of her constant nobleness," etc., these endowments were made, five for proficiency in mathematics since "proficiency therein is perennially the symptom not only of steady application but of a clear methodic intellect," and five for the same in classical learning "which also gives good promise of a mind, although it is not wholly certain that in future generations the ancient writers will hold their present position as instruments of culture." The terms upon which these scholarships were to be bestowed we give in Carlyle's own earnest words:

They shall always be given, on solemnly strict and faithful trial, to the worthiest; or if (what in practice can never happen, though it illustrates my intention) the claims of two were absolutely equal, and could not be settled by further trial, preference is to fall in favor of the more unrecommended and unfriended. Under

penalties graver than I, or any highest mortal, can pretend to impose, but which I can never doubt—as the law of eternal justice, inexorably valid, whether noticed or unnoticed, pervades all corners of space and time—are very sure to be punctually exacted if incurred, this is to be the perpetual rule of the Senatus in deciding. So may a little trace of help, to the young heroic soul struggling for what is highest, spring from this poor arrangement and bequest. May it run forever, if it can, as a thread of pure water from the Scottish rocks, tinkling into its little basin by the thirsty wayside, for those whom it veritably belongs to. Amen!

Thus was Jane Welsh Carlyle immortalized, as she would have wished, in service. H.

PORTRAIT BY SIR JOSHUA REYNOLDS

known young writer, son of a farmer, albeit college-bred—a substantial fortune which enabled him to write for humanity's sake, not for his bread and butter. He himself always felt a childlike dependence on her, was miserable when she was away, and for a long time after her death was unable to write or plan, in fact, thereafter he seemed to be only waiting for death to claim him.

To Moncure D. Conway (so well known now because of his vindication of Thomas Paine) Carlyle said, sixteen years before his death, during one of Mr. Conway's visits:

OUR YOUNG FOLK

THE LIBRARY

AGE after age, like waves o'er ran
The earth, uplifting brute and man;
And mind, at length, in symbols dark
Its meanings traced on stone and bark.

On leaf of palm, on sedge-wrought roll,
On plastic clay and leathern scroll,
Man wrote his thoughts; the ages passed,
And lo! the Press was found at last!

Then dead souls woke; the thoughts of men
Whose bones were dust revived again;
The cloister's silence found a tongue,
Old prophets spake, old poets sung.

And here, to-day, the dead look down,
The kings of mind again we crown;
We hear the voices lost so long,
The sage's words, the sibyl's song.

Here Greek and Roman find themselves
Alive along these crowded shelves;
And Shakespere treads again his stage,
And Chaucer paints anew his age.

As if some Pantheon's marbles broke
Their stony trance, and lived and spoke,
Life thrills along the alcoved hall,
The lords of thought await our call.

John Greenleaf Whittier

Sponges

THERE are in the ocean many little animals which so closely resemble plants that for centuries they have been mistaken for the latter even by naturalists. To this class belong the very useful sponges.

Sponges, though they look and grow like plants, are really a low form of animal life. They live at the bottom of the sea from five hundred to twelve hundred fathoms deep, down among the crevices and clefts of the rocks. Like plants they live a stationary existence. Only when they are tiny babies do they move around freely, swimming with a gliding wavy motion around the parent sponge. After they have been in the water for some time they rise to the surface. For two or three days they search for a place to fasten themselves, and when they find it, there they fix themselves for life.

The holes and channels in a sponge, with which we are so familiar, serve the animal for breathing-passages and for the digestion of food. The sea-water flows in and out of them continuously, and as it passes, the animals take from it the food that they need and the air that it carries.

Sponges are so useful in many ways that sponge-fishing is an important industry. It is carried on largely along the shores of the Grecian Archipelago and the coast of Syria, where the best sponges are secured, although they are also found in other parts of the world. The finest sponges are those gathered by divers, who carefully cut them from the rocks, instead of tearing them away, as the land fishers do, by means of their three-toothed harpoons.

There are several hundred varieties of sponges. One of the handsomest is the one known from its form as Neptune's Cup. It

Lomaland Photo. and Engraving Dept.

LOTUS BUDS AND BLOSSOMS IN HOLLAND

is met with off Singapore, and sometimes grows to be three or four feet high. The Gulf of Mexico and the Bahama Banks also furnish sponges. Here the fishermen sink a long mast or perch into the water near their boat, and moor it there. Down the pole they slide and drop among the sponges, which are easily gathered, and carried to the upper air.

Although sponges die in the air, a second life begins for them after they are cleansed and purified. It is a life of useful service.

STUDENT

Sea-Bathing at Scheveningen

THE beach at Scheveningen in Holland is one of the finest in Europe, and on summer days the electric cars from The Hague are packed with passengers going out to Scheveningen to bathe.

The beach for miles is dotted with bath chairs where invalids and old people sit enjoying the sunshine and sea breeze. The surf is dotted with hundreds of bathers and swimmers.

On the way to the beach one notices, drawn up in line, many little covered wagons like tiny houses on wheels with a horse hitched to each. If you are going to take a dip in the sea, you hire one of these bath-wagons and on stepping inside find yourself in a tiny room with a curtained window, a mirror, and hooks in the wall for your clothes and towels. While you put on your bathing-suit, the old horse goes jogging down to the surf and before you are ready—for it is difficult to dress standing because of the severe jolting—you hear the waves splashing against the wagon steps and the horse's legs.

Stepping out of your little door, you are

met by a big, ruddy, strong, pleasant-faced Dutch fisher-woman in a bright blue bathing-dress. She can tell almost at a glance how much you know about sea-bathing and swimming, and if you are inexperienced she keeps near by to see that no mischance befalls you. When she thinks that you have been in long enough she tells you that your lips are blue, and begins to hustle you towards and up the steps of your bath-wagon. It is useless to oppose her for she is much the bigger and stronger; so into the wagon you go either willingly or unwillingly, and while you hurry to dry and dress yourself, the old horse patiently jogs up from the beach again and deposits you where he took you up. Then he waits to take another bather down for a refreshing dip in the sea.

L.

ACTIONS give to life its strength.—*Richter*

THE most useful piece of learning for the uses of life is to unlearn all that is untrue.—*Aristotle*

LET us beware of losing our enthusiasm. Let us ever glory in something and strive to retain our admiration of all that would enoble and interest, in all that would enrich and beautify our life.—*Phillips Brooks*

MEN give me some credit for genius. All the genius that I have lies just in this: When I have a subject in hand, I study it profoundly. Day and night it is before me. I explore it in all its bearings. My mind becomes pervaded with it. Then the effort which I make is what people are pleased to call the fruit of genius. It is the fruit of labor and of thought.—*Alexander Hamilton*

THE CHILDREN'S HOUR

A Born Manager

TILLY was a born manager from her cradle — so her mother said — and certainly as time went on she ruled the nursery, and younger sister and baby brother alternately stood in awe and rebelled against her decrees, and peace was far from the nursery. Tilly was eight years old when her mother told the children that Father's sister from America was coming to live with them and be their teacher.

"It is to be hoped that she will keep you in order," said Father, as the fire-irons came down with a rattle. The fire needed a poke and Tilly was attending to it while the parlor-maid stood by.

Aunt Kate had been with them a week and Alice and little Ben were her devoted admirers, while even Tilly felt the charm of her presence.

"Please tell us some more stories about the Râja Yoga children, Auntie," pleaded Alice one day as they rested after a wrestle with the weeds in the children's overgrown gardens. Alice's garden was fairly clear now, but Tilly's lay almost untouched.

Alice had been "pulling the weeds too roughly," "beginning at the wrong corner," "using a fork, instead of a hoe, and I don't know what else" — so Tilly said.

Aunt Kate was listening. "Matilda," she said quietly, in reply to an appeal for her opinion, "*haven't you any duties of your own, is your garden weeded?*"

The little girl looked at her plot, and was silent; the weeds told their own tale.

Aunt Kate turned to Alice, and brightly began: "Now about the Râja Yogas? Very well. Not once upon a time there was, but in our time there is a lovely spot on the earth where children are taught to be happy and as bright and helpful as sunbeams. For why? Because they are taught to see their *own duty*, and *to love to do it*. Everyone has a duty to do, did you know that? The Râja Yogas learn it. I saw them at work in their gardens one day. All the beds were not the same, but when you looked at them all together, the color effect was lovely, such a beautiful blending of varied hues, just as I see it will be with yours and Matilda's in early spring. Here are the leaves of an early snowdrop in yours, and the tiny shoot of a sweet pea."

"And Matilda has violets," exclaimed Alice eagerly, "see the glossy green leaves."

"There is danger when we try to do another's work, as we cannot do two things at once, and therefore our own remains undone; and as you can easily see, one untidy plot spoils the effect of the garden. The Râja Yoga children knowing this turn all their energy into doing their own work well for the sake of benefiting all."

There was quite a large patch clear in Matilda's garden, and as her aunt finished, she asked, "Then managers should know how to work shouldn't they?"

"That is," replied Aunt Kate, "one Râja Yoga secret of success." E. I. W.

ON THE HILLSIDE

SPRING'S SIMPLE FLOWERS

THE bluebells faintly show the sky,
Caught in their little cups;
The daisy is the morning's eye,
Whereat the glad bee sups.

Mayapple blossoms, white as snow,
Are full of incense sweet;
Their bright hearts hold the moony glow
Of sunbeams without heat.

The buttercups of purest gold
Are by spring's fairies wrought;
A dainty chalice each to hold
Titania's richest draught.

The violets, so delicate,
Are scattered up and down,
All chaste, with dewy dawn-sighs wet,—
Dropt from Diana's gown.

So in the secret woodland dell,
Sequestered from the sight,
These simple Nature's children tell
Their story of delight.

Edward O. Jackson in Kansas City Star

The Farmer's Lesson

A YOUNG farmer sowed a field of oats. In the seed was one tiny grain of wild mustard seed, but from that grain there sprang an immense stalk of mustard, which waved its yellow blossoms high above the oats.

"That is a bad weed, my son," said a wise old man who passed by one day. "You had better pull it up before it goes to seed." But the young man laughed; the weed looked so pretty in the green field he did not like to pull it up; besides, only one stalk did not amount to much. He would cut it when he

reaped the oats. So the wild mustard grew, and as it was so tall, the wind sent the seed flying far and wide.

Next year the farmer again sowed the field with oats. When the grain was a few inches high, here and there, all over the field, the yellow blossoms of the wild mustard appeared. Then the words of the old man came to the farmer's mind.

"Alack!" cried he, "who would have thought that one weed would sow so many others. How now shall I rid the field of them?"

So he engaged all the boys he could hire to pull the plants up, which they did, but many escaped their notice; and year after year the mustard appeared; and the farmer is fighting it still.

AUDREY

'Where There's a Will There's a Way'

WHAT is it in us that wishes for things, and wishes to do things? It is our desires. First we use our minds to think about the things and then we use our wills in order to get them.

We can use our wills for good or for evil. The more we use them the stronger they grow, just as the body grows strong by means of exercise. If we can be sensible and learn to understand ourselves, we shall find little by little, that it is better to use our wills for unselfish purposes. This is the only way to be truly happy in the world.

The reason why we are here on the earth is that we need the experience of finding out things for ourselves in order to get wisdom enough to be helpful to others; for it takes very wise persons to help others in the right way.

Many people before us have learned by experience what we must now learn, that they cannot tell how to help others if they are always using their minds to think about things they would like to have, things that would please them. Desires have a way of growing and never being satisfied, and if the will be kept busy carrying out these selfish desires, it has no chance to be used in unselfish deeds. Soon a person living like this forgets how to help anyone, and becomes very lonely and unhappy.

We can use the will in many ways. Training the will to endure pains and aches that cannot be cured at once, is helpful to us. It keeps us from whining and silly complaints. If this wonderful will of ours is strong because it has been used for good only for a long time, think what a help it can be in overcoming every bad habit. Some habits have very deep roots. They were begun long ago, before we began to think of good and evil. They came from evil desires, and, little by little, they have closed in upon the soul until it can no longer act freely through us. But if we learn to use the tools we have — mind and will — and use them always for good, we soon find out that "Where there's a will there's a way," and a happy way too. EUGENIA

How Disease-Germs are Created

AN article in a scientific paper, on the great danger of the common house-fly as a spreader of disease-germs, serves to remind one of the many scares of this sort that one meets with in the pages of public opinion. An occasional scare might perhaps scare us; but when there are so many, the effect is apt to be neutral and we accept the danger as normal and inevitable. The hopelessness of trying to defend ourselves by direct precautions against so many foes overwhelms us.

But these microbes that science shows us are only the agents of disease; they are created by other causes, and their action is promoted or prevented by these other causes. We may escape contact with the germs, or we may come in contact with them and not be affected. The causes which determine these events come mostly under the large and miscellaneous category of "chance" and "fortuity"—the names which science gives to causes which it has not probed.

Yet these unknown causes, classified as "chance," play by far the most important part in our lives.

Unknown Laws of Harmony

What are these unknown causes? It is clear that, as science knows so little about the laws of nature, there must be many such laws which escape its notice; hence there must be many effects for which science cannot assign the causes. When this happens, science speaks of chance, and religion speaks of "His Hand." When, through ignorance of nature's laws, a calamity happens which knowledge might have avoided, the pious person says, "He knows what is best"; and science appears to think that there is some power called "Probability" which can do things. In any case it would be convenient if we could propitiate or manage either of these powers; we have wrested a good many things from the hand of God and Fate and brought them under the thumb of science already.

And, just as there are many effects without apparent causes, so there are many causes without apparent effects. Here is surely a field of discovery for the curious—to pair off some of these odd causes with odd effects.

The Reaction of Our Own Acts and Thoughts

A large class of causes, whose effects we cannot trace, are those which we set in motion by our thoughts and emotions. For thoughts and emotions are energies, and their results must be accounted for according to scientific law. Some thoughts result in direct action on our part; but many do not;

what becomes of the energy in these cases? It goes forth in waves on the ether, and may transform itself into other forms, or add itself to other thought-energies, or accumulate, just like other natural forces do; and finally it may react on ourselves or influence other people. It is these forces in the ether or "astral light" that are responsible for so many of the effects called "casual." Many of our actions are capricious or fortuitous, as we say; but what does this mean? It only means that their cause is unknown, for a cause they must have; no action can be without a cause. Thus the side of the street we shall walk on, the food we shall select, and countless other events, are predetermined by the astral influences about us, which often decide our choice without our realizing the fact.

All Nature an Organism

This is what is called "luck"; some people have an accumulation of favorable influences around them; others of unfavorable. And these influences have been created by themselves, through their thoughts and emotions. Thus we can create favorable conditions by having clean and wholesome thoughts. But the effect may take a long time to work out, because there may be a large accumulation of the wrong kind of influence to be worked off.

Returning to the subject of disease, we see that its most potent cause is the unfavorable thoughts and emotions of humanity. All this tremendous array of unfavorable forces that men create must find its vent somehow; some of it inspires bad action; some finds expression in the lower kingdoms of nature among savage animals, insect pests, and noxious pests: some collects into centers, gathers to itself atoms of matter, and becomes little microbes that go forth and settle on the unguarded. So it is not the bodies of the germs, but their souls (so to say) that are the real causes of the mischief; and these souls we ourselves create.

"Islâm, the Religion of Common Sense"

IN a former number of the CENTURY PATH (Vol. XI, 43) notice was given of a series of articles in the *Hibbert Journal* on common sense religion, or the religion of sensible men. "The Religion of Sensible Scotsmen," by Dr. W. Wallace; and "The Religion of the Sensible American," by Prof. David Starr Jordan of California, have been followed by "Islâm, the Religion of Common Sense."

It requires some courage after the recent outbreaks about Adana and Tarsus, by fanatic Muslims, to speak of "Islâm as the religion of common sense." But those who pro-

fess a religion are not always true exponents of it in their lives; and it may be well to try to find out the "better self within" which, in Islâm as in other religions, has often been sadly misrepresented by the outer form. Dr. Hughes of New York, Fellow of the Panjâb Oriental University, and author of a *Dictionary of Islâm*, stands sponsor for the writer of this article, "Islâm, the Religion of Common Sense," who does not give his real name but uses the pseudonym of "Ibn Ishâk."

In his foreword, Dr. Hughes says that "at the present time Muslims know very little of Christianity; and Christians know infinitely less of Islâm." He holds that as Judaism, or "the Law," was called "the schoolmaster which brings us to Christ," so it may be said of Islâm. This has been flatly contradicted by some who have had much experience of Christian missions in Africa, and elsewhere. Districts of Africa which have become Muhammadan, it is said, are farther removed from becoming Christian than they were before. On the other hand there are many who maintain that "the new spirit" which is promising better things for Turkey has sprung from the seed sown in American or English schools throughout Asia Minor. Be this as it may, it cannot be denied that Islâm has been a power in the world. That which "blazed heaven-high from Delhi to Granada," as Carlyle has it, must have been full of power, whatever else it was, or was not. It is still ranked by Max Müller and others, as one of the three growing religions of the world, the others being Christianity and Buddhism. Compilers of maps and statistics show that Islâm covers more of the earth's surface than any other religion.

It is well known that Islâm, like other great religions, has its esoteric side as well as its exoteric; but "Ibn Ishak" confines himself to those things in Islâm which most appeal to the majority of its adherents, and it is on the ground of these that he bases its claim to be "the religion of common sense." Let us hear what he says to make good his claim.

In the first place, the controlling idea of Islâm is that there is one God, and that this one God is the *Absolute Governor of the Universe*.

Again,

The *native simplicity of the Muslim's Creed* recommends it to the man of common sense; There is no god but God, and Muhammad is the messenger of God.

By the word "messenger" Muhammad wished to include many great men. "Ibn Ishâk" says it would include Plato, and Aesop, and Zoroaster; Shakespeare, Goethe, Schiller and Milton, and many others.

Among the things which conduce to the vitality of Islâm is the "cry of the Muzzan," when in the stillness of the early morn, before sunrise, he calls the people to prayer:

God is great! I testify that there is no God but God, and Muhammad is the messenger of God! Come to prayer! Come to salvation! Prayer is better than sleep.

It is well known that perfect conviction is a great element of strength in any cult or religion, and this the Muslim appears to have. Some Christians have openly said that they "did not mix up religion and business"; and results confirmed this. But the Muslim carries his religion with him. "Travelers in Muslim lands," says Ibn Ishâk,

are always impressed by the sight of a vast congregation prostrate in prayer under the open canopy of heaven, as the Imâm, or Leader, raises the cry *Allaho Akbar* (God is great).

The Muslim is taught cleanliness as part of his religion. In London or New York the "great unwashed" are to be found, but in Mecca there are none.

Every Muslim, before he takes his place in the congregation for prayer, or even before he prays in private, must perform his ablutions, and very minute are the instructions as expressed in the holy Kurân.

It will come as a surprise to most people to hear that Islâm has no priesthood; and that the intelligent Muslim finds no warrant in the Kurân for the Caliph.

The Ottoman Caliph is an excrescence and intrusion in Islâm, which has been kept in existence at the Bosphorus by French and English bayonets. In India the 75 millions of Muslims recite the Khutbah on Fridays, not in the name of the Turk, but in that of the "Ruler of the Age," the "Prophet of Peace," Edward the VII.

But though, theoretically, there is no priesthood; and though the Imâm is simply the Leader (Imâm ul Mominin), and Islâm is a Commonwealth; yet, practically, as recent events at Constantinople clearly showed, the Mullahs are very much in evidence as priests seeking temporal power. There are the softa, or student of theology; the hodja, or wise man or teacher; the mullah, or priest; the mufti, or chief priest; and the ulema, or expounder of the sacred law: practically a priesthood, though not quite of the Roman Catholic type. "Priestcraft has been the bane of civilization," says "Ibn Ishâk." And there can be no doubt that the fanatical outbreaks in Turkey at various times have been in a large degree caused by the priestcraft of the mullahs. In the recent revolt at Constantinople it is said that these men did their utmost to sow the seeds of dissension among the troops of the Young Turkish party. Yet when the friends of reform triumphed the Sheik-ul-Islâm was ready to condemn the Sultan, and welcome his successor. The worship of the "rising sun" is world-wide!

"Ibn Ishâk" points to the clearness and definiteness which characterizes the creed of Islâm, as tending to make it a common-sense religion. It is not vexed with the many hair-splittings which have so hindered the progress of Christianity.

The teaching of Muhammad suppressed in a large measure the tendency to suicide which was common in his day. He sternly prohibited intoxication; and it is said that the Muslim is most temperate. Filial devotion is a marked feature in Muhammadan countries. "Ibn Ishâk" says that "Monopolies and Trusts" seem to be a burning question in the United States of America at the present time. It is true that in Muhammad's time there were no Trusts, but there was such a thing as a "corner in wheat"; and he declared that whosoever creates a monopoly is a sinner. The man who keeps back grain forty days to raise its price will go to "hell-fire, for he is both a forsaker of God, and is forsaken of God."

According to "Ibn Ishâk," Darwin and Wallace were but following in the footsteps of Muhammad in teaching the doctrine of evolution. In the Kurân, Sura 6. 8, it is written:

No kind of beast is there on the earth, nor fowl that flieth with wings, but is a community like yourselves.

And the author of the *Masnawî* writes:

I died from the mineral and became a plant;
I died from the plant and re-appeared in an animal;
I died from the animal and became a man:
Wherefore then should I fear? When did I grow less by dying?
Next time I shall die from the man
That I may grow the wings of the angels.
From the angel too, must I seek advance—
I shall become that which entereth not the imagination.

One result of this teaching was kindness to animals. To such a length did the prophét himself carry this that on one occasion, so it is said, when his favorite cat went to sleep on the sleeve of his blouse he cut off the sleeve rather than disturb the cat!

Fasting is another of the excellencies of Islâm mentioned by "Ibn Ishâk"; and he believes that in this also common-sense is manifested. It is well to pause now and then. It is conducive to health of body and soul.

Much objection has been made to the Islâmic Paradise; but the Prophet, says "Ibn Ishâk,"

did not begin his divine mission by preaching to a nation of eunuchs, but to a community sunk in the very depths of licentiousness.

Besides, it is held that much is figurative in the teaching of the Prophet on this subject, just as in the *Song of Solomon*, or in the *Apocalypse*. In reply to the objection made against polygamy, "Ibn Ishâk" says that

not ten per cent of the 75 millions of Muslims in India are polygamists; and divorce is not nearly as common among Muslims as it is in America at the present time.

The condition of things in the large cities of Western lands is regarded as much more immoral than the polygamy of Islâm. Islâm is a religion for every day life.

It is never thrust into a corner, but in the national, domestic, and commercial life of the individual it takes a first and prominent place.

It is not denied that Islâm, like Christianity and Buddhism, has fallen far short of the teaching of its founder. The question of the hour is: Can Islâm be reborn? Is a Renaissance possible in Islâm?

The Age (aeon) on which we have entered has seen already a world-wide "stirring of the dry bones." The graves are opening, and nations are coming forth to the light of a new day. Japan, China, and the other countries are witnessing to a new spring-time. May not the Semitic peoples respond to the pulsations of a new life? There is a Spirit of Reform at work in Turkey, Persia and elsewhere—even in the shadow of the Vatican. What we call the great Theosophical Movement is world-wide, and it exists under many aspects. It is well at such a time as this, especially, to look beyond the externals that differentiate, and fix our eyes on the Light of the One Spirit in which "we live and move and have our being."

Filial devotion, temperance, suppressing suicide, condemning monopolies and trusts, teaching cleanliness, making religion permeate all life and not Sundays only, prayer and fasting, kindness to animals, resignation to the divine will: these are some of the points that "Ibn Ishâk" mentions as supporting the claim of Islâm to be the "Religion of Common Sense."

Some Views on XXth Century Problems

Multiple Personality

ONE of the victims of what is called "dis-associated personality" has at last written a book; we have the malady as seen from within. She is or was a patient of that Dr. Prince whose study of "Miss Beauchamp" and her subsidiary personalities appeared three or four years ago. Like the latter, this patient was "cured" by hypnotism.

Her diverse personalities were two, referred to as A and B. C was the "normal self" finally evoked by the hypnotic process. A was gloomy, lachrymose, retiring, puritanic, and parsimonious. B was roystering, humorous, extravagant, a lover of society and very careful of her appearance. B knew all about A; A nothing of B except in so far as B wrote to her, usually jeeringly, and in so far as from time to time she would suddenly find herself in distressing situations of B's devising. She was also assisted in her knowledge of B by a joint diary which the doctor induced them to keep. From this the genesis of the trouble is easy to see.

In childhood the writer alternated between submission to, and rebellion against the (apparently over-puritanic) conditions of her life. She lived along fairly well by suppressing the rebellious impulses. Twenty years later she had to spend four years nursing a sick husband, and now the old alternations were between the sense of duty and the strong desire for pleasure.

The old rebellious group became intensified. It was a longing for happiness, a disinclination to give up the pleasures of life as the conditions required; there was a certain determination to have those pleasures in spite of everything, and this caused a constant struggle.

Finally her husband died, away from home. The blow prostrated her; perhaps conscience pricked; and she developed the lachrymose personality A. But she also developed on the other side the revolting and pleasure-loving B, now also a full personality.

B intensified her separate consciousness by cultivating or permitting a profound interest in a man. The man deceived her in some way, and under the new shock A took entire control. After a while B revived, and from that time until the evocation of C, the two alternated.

It is obvious that we have here but an extreme degree of the alternations of any impulse-ridden character. To call this extreme degree by a separate name, "multiple personality," is to run the risk of forgetting its steps of genesis. The large and mysterious label may cause some weak oscillating character, which should have been taught to *fight*, to dignify itself as a "case," interesting to science, and as a medical case not to be expected to cure itself by moral effort. It is crystalized hysteria, and should be so treated. But the *hypnotic* treatment leaves the patient in the daily and hourly peril of the lapse of the influence, a lapse which would reveal her as even more will-less than before.

There will be no more of these increasingly numerous cases when the training of child-

ren involves their awakening to true self-consciousness, a self-consciousness which is aware of its power to dominate all the moods and all the thoughts. We have all of us will enough for anything, in strict truth; but the potential user of the will has not realized his own right or his own being. M. D.

Home Magic

PEOPLE who waken themselves—if that is the right way to put it—at the exact moment they choose altogether miss the lesson concealed in their little feat of magic. We are all in favor of the culture of the imagination, yet never see that this, like charity, begins at home.

For this feat rests on imagination. The subjective picture, a motor picture, of oneself as waking at that moment, is created. Imagination can create or call up visual pictures, colors, scenery, etc.; sound "pictures," as when a melody is imagined; motor pictures—of oneself doing something—as in the case in hand; *being* pictures, as when one imagines oneself a soul.

As soon as a motor or doing picture is created, it begins to be energized by will. When the power is perfected by practice, the man finds he can now control his deeds and have them as he wants them, free from sensual impulsions. The victim of alcohol who will give time enough to the creation of a doing picture (the putting down of the glass) and of a being picture (himself as superior to the drink lust) will win his fight.

But he must give enough time; and here the next law comes into view. Every yielding to a sensual impulse is a yielding to an enemy in one's own nature of some of that creative power necessary to make pictures. That is why man often stands nearly powerless in the midst of enemies within his gate to which he has yielded his creative virility. He has, however, always enough power left to begin regaining his power, to cripple the enemy; even though, in that particular life, there may not be time enough remaining to *kill* it.

Most people find that the waking process is facilitated by uttering aloud the hour at which the waking is to occur. Another fact in psychology thus comes into view: that something within our consciousness, below the level of thinking mind, listens to what our lips say, and, if the utterance is within its comprehension and sphere of life work, enters into a corresponding state of feeling and upon a corresponding line of action. To feel a dislike for a man and then to utter it, is to register the dislike in this sub-mental field. To feel a dislike, but to utter something commendatory or appreciative of a good point in that man's character, is to sweeten and clean, instead of soiling, the sub-mental field.

Many, who would like to imagine themselves as souls, to create themselves as souls, do not know what pictures to attach to the word soul.

Soul is willer. When the waking process has been achieved, the man may find his getting up impeded by one of the sensual powers

in his consciousness, the power that loves bed. To the extent that the man feels himself above this power and disregards it, he is acting as soul. Soul is what is above the sensualities, free. It is picture maker. It is the field-cleaner, life-maker, and helper. It repels and wipes out the pictures of dislike, which injure him who has them and him of whom they are had. It calls up the pictures of other men's strengths and virtues, thus at once creating them for its own use, helping them in the other men, and diffusing their influence throughout the world-atmosphere. It is universally beneficent and compassionate; the neighborhood of a man who has achieved it is helpful, healthful and life-giving to everyone and everything in his neighborhood. In its full strength it is one of the cosmic gods; for that is what man really is, one of the Host of Light sent into the world-vineyard by the "Father."

Shielding Some Victims

ABOUT one adult in 500 throughout the country must have begun to become keenly aware of an alteration in the law at the beginning of April. These are the victims of opium, morphine and cocain. The numbers are the reckoning of Dr. Hamilton Wright, one of the American commission to the Shanghai conference for the investigation, regulation, and partial suppression of the world's opium trade. Our victims to crude opium he reckons at between 5000 and 15,000; morphine and cocain account for the rest.

One in 500, then, for the general average; among criminal classes 1 in 7; among unfortunate women 1 in 5.

Entrance of these narcotics into this country is now prohibited except at ten specified ports. Here they are closely inspected, and from here their further course is followed out to the consumer, and he must get it as part of a medical prescription or at the hands of a doctor.

Temptation to smuggle must of course become very great, and one does not see how with the practicalization of air-transit, smuggling can be prevented. The places where opium is *grown* must then be watched by general international agreement—of which there are already promising signs.

A certain small use of opium and morphine in medical hands is at present a necessity, the lesser of two evils; and the same may be said of cocain. But with now rapidly advancing knowledge of the powers of electricity in inducing general and local anaesthesia, a few years may see an end of the necessity. The pain-relievers become more numerous, and safer, the more sensitive our later generations become to pain. It is not, perhaps, that flesh *per se* is more sensitive, as that *mental* anticipation and memory are keener and focus themselves into the moments of actual pain. Those who are so anxious to "develop will" might note that bearing pain without the palliation of a narcotic is one of the best methods. But their aspiration is usually to develop it *without* either pain or even effort! STUDENT

Market-House, Auray

THIS lovely old timbered market-house is now a thing of the past, having been pulled down, some two years ago, and replaced by a modern and utilitarian structure. Both locally and by regular visitors to Auray, strong disapprobation of this act of vandalism was expressed. It was said, and with justice, that if the local authorities wished to modernize the ancient town, they would do well to install first a drainage system throughout it, and take steps to prevent refuse accumulating in the streets, as it does at present, causing the most malignant odors at every turn. However, the Bumbles of Auray disregarded all protests, and demolished the unique structure which had attracted large numbers of tourists every year, to the great advantage of the townsfolk, and was thus, to take only the lowest view, the biggest commercial asset the town possessed. It does not appear to have been in a ruinous condition, nor was ground space lacking to build a new market-house, if required, hard by.

Bold timber work supported the great roof, which sloped very sharply to its high ridge above, and descended so low that a tall man had to bend his head to pass under the eaves. Inside were a large number of stone stalls, and also the fine oak staircase, with massive balustrade, seen in the illustration. Up this stairway went to their trial and death-sentence many of the Emigrés who were defeated and captured after their ill-advised landing at Quiberon, under the leadership of the brave Sombreuil, in June 1795.

To turn from this sad historical association to the bright scene which the old market presented in its latter days, one cannot do better than quote the vivacious description of Francis Miltoun, from his delightful book, *Rambles in Brittany*, written in 1905.

It is a question if this same market-house be not quite the most theatrical thing of its kind in all France. It is for all the world like a successful piece of stage carpentry, with a great spectacular stairway running up into its garret above, quite in the manner that one has seen upon the stage over and over again, when the heroine or the villain—it does not much matter which—escapes from his, or her, pursuers. Low built, heavily raftered, and with a leaky roof allowing rays of sunlight to dribble through into the gloom within in a most entrancing manner, this old market-house is the center of the life and activity of the place for fifty-two Mondays in each year.

Lomaland Photo. and Engraving Dept.

INTERIOR OF OLD MARKET-HOUSE, AURAY, BRITTANY

Within and without the walls of the market-house is gathered the most varied conglomeration of wares imaginable. Beside the draper's counter are baskets of vegetables, eggs, or fish. A poor little calf, tied by the legs and lying at full length on the ground, keeps company with his former farmyard neighbors, the ducks and geese, but on either side is a second-hand collection of ironmongery and old shoes, and it should be the envy of the provident, for two sous buy anything in the collection.

The country-side Breton peasant who comes to Auray on a market-day is the glass of fashion of his race, his jacket is embroidered in braid of gay colors, and velvet bands on his sleeves and collar. His shirt is high and stiffly starched, and his felt hat or cap heavily hung with velvet ribbons. The women-folk are clad in equally spectacular fashion, with high white caps and full-sleeved bodices, each with a black velvet band around the sleeve, and full gathered skirts, spoiling all symmetry of form as nature made it.

Mighty Babylon

THERE are and have been many different explorers of the site of ancient Babylon. Some, confining themselves to the excavation of some small portion of the city, belittle the accounts of Herodotus and other historians; others, going farther

out, have realized that the city was actually as great as it is said to have been. The total effect of all the explorations is to convince us that the accounts have been underestimated rather than overstated.

The mounds marking ancient Babylon extend for about three miles along the eastern bank of the Euphrates. A German Oriental Society has excavated from the largest mound two palaces of Nebuchadnezzar and some temples. One of the palaces must have had 200 rooms, all furnished in the richest style. The explorers have come to the conclusion that Herodotus' estimate of the size of the city walls was not exaggerated; he makes them 348 feet high and 86 thick. Many details of these excavations are given in the newspapers, and at the present time there seems to be a perfect mania for instilling into the popular mind a conviction of the greatness of ancient civilizations.

What we have to recognize, however, is that the knowledge possessed by these great civilizations must have been on a proportionate scale, and that our old ideas as to the intellectual and moral status of these people have to be altered just as we have had to alter our ideas as to their material achievements. The fact

that these civilizations perished loses most of its force if we remember how long they endured and that nothing on this earth is exempt from the law of change and decay. But, though the body has perished, in accordance with natural law, the Soul still lives; and the human Souls which were incarnated in the denizens of these empires have passed on to other incarnations, there to manifest themselves under new forms and to learn more lessons. And perhaps some of them are incarnating in contemporary generations and bringing back to earth again the influence of their former greatness and knowledge. T.

Roman Waterworks to be Used Again

THE town committee of Szamosvár in Transylvania has decided to use the thousand-year-old water mains and reservoirs which have remained since the Roman occupation. Archaeologists state that this system served as the water supply of a large fixed camp—Congricastrum. The reservoir is on a hill near the town; the dirt has been removed from it and the medical authorities declare them fit for use. T.

The Trend of Twentieth Century Science

The Cell Cosmos

COLLOID matter is the intermediate chaos between two cosmoi. This somewhat cryptic formula might do as an abstract of the recent suggestion of Professor Little, the chairman of the industrial chemists and chemical engineers, American Chemical Society. Colloid matter is inanimate and chaotic jelly; below it is the inanimate cosmos of the crystal; above is another jelly, animate and a cosmos, protoplasm.

The molecules of the crystal are arranged in an orderly manner; their motions, perhaps small and merely oscillatory, are regulated according to a plan.

The molecules and groups of them in the colloid jelly are as it were rushing about anyhow. But in the cell of protoplasmic jelly the confusion has been reduced to order. The individual molecules are all rotating on their axes in the same direction, and they are moving vortically in the same direction about the center. Any matter drawn into the cell as food is soon forced to obey the general plan at work and becomes part of the little cosmos. This orderly arrangement and motion constitutes life, and the drawn-in food matter, in its subjection to the plan, is made alive.

Such, roughly, is the theory. But we must surely go a step farther in and say that life is rather the *cause* of the orderly arrangement than the arrangement itself. How did the arrangement come about? Whence the force that can subject and harmonize the disorderly motions of the molecules taken in as food? How comes it that in the later subdivisions of the egg-cell, when the organs of the resulting embryo begin to appear, the groups of cells differ from each other according to the organ they compose, and from the elementary parent cell?

The difficulties will only vanish in the hypothesis that life is an intelligent volitional force *sui generis*, the guide of the forces hitherto alone studied by science, working according to a ceaselessly unfolding plan. It directs the physical forces, and changes them one into the other, somewhat in the same way as a man may direct his available force into his arms, legs, or brain, according to the work he proposes to do. STUDENT

The Universe as a Fluid

MODERN chemistry gives us a conception of the physical universe as a sort of infinitely etherialized fluid.

In a lecture recently delivered before the (English) Society of Chemical Industry, it was pointed out that

One of the salient discoveries of the last century, on which sufficient stress is seldom laid, is the discovery that chemical affinity and electrical attraction are one and the same—that the electric force between charged bodies is really chemical action at a distance, and that the chemical combination of atoms and molecules is due to their electrical attraction.

The bond tying atom to atom in a molecule is regarded as “made up of a bundle of lines of (magnetic) force.” Some few of these lines radiate or stray *outside* the molecule towards any other that may be near.

This weaker, subsidiary attraction between *molecules*, constitutes the cohesion, the tenacity, of matter in mass. This “though great enough in the aggregate, is a small force per unit, and is incomparably smaller than the forces specifically known as chemical.” It is a sort of residual phenomenon manifesting after chemical affinity is satisfied. It may be, say two thousand times less than would be the force developed between two molecules by charging them with opposite electricities, that is, by giving them the same attractive energy as that which urges two atoms into chemical union.

When this residual affinity, cohesion, is at its maximum, the close locking of molecules which it produces, constitutes *solidity* in matter. When less, the matter is *liquid*. When “entirely” absent, a “perfect” *gas* results, in which the molecules are regarded as flying quite free from each other. Yet they are not *quite* free; gravity still unites them. Gravity, eclipsing all the other attractions where planets and other immense bodies are concerned, “is trivial when compared with cohesion for bodies of ordinary size, and is practically infinitesimal among atoms and molecules.”

So we have, as manifestations of electric attraction, from most to least marked: (a) chemical affinity or the full action of the electric charge, whether between atoms or molecules; (b) the first order of *residual* affinity, cohesion; when strong, resulting in solid matter; when weaker, in fluid; when weakest, in gaseous; when practically absent, in “perfectly” gaseous matter; (c) the second order of residual affinity, gravitation. To a being dwelling on a molecule and with only intermolecular senses, this last would be absolutely undiscoverable, except perhaps by reasoning; to a being dwelling on an atom, within a molecule, (b) would be undiscoverable. By analogy we may assume that there is still finer order of attraction, finer than gravitation, between “universes,” to us undiscoverable because we dwell within *this* universe. STUDENT

A Problem in Acquirements

A CURIOUS problem in bacterial evolution is raised in *Prometheus*. Most bacteria cannot develop when the temperature of their medium is above 113° F. As the temperature rises, they are at first checked and finally killed. But some few species, known as thermophile bacteria, can do with, and need, much hotter surroundings, even up to 167° F. Bacteria favoring such figures as this are called *ortho-thermophiles*. The question is how did the *ortho-thermophiles* acquire their peculiar taste for heat; how did they acquire the power of living in it? Their food is decaying matter; where is decaying matter at a temperature of, say 150° F.? Hot springs have that temperature, and more; but such springs are either devoid of any organic matter whatever, or only contain a trifling development of low algae.

If we consider the properties of organisms as

the result of adaptation, the problem arises, what is the natural home of these *ortho-thermophile* organisms?

The writer suggests accumulations of vegetable matter undergoing slow spontaneous combustion. These provide the necessary heat. But, as he notes, such combustion is itself the result of the bacteria which are supposed to need the heat of it! Moreover such piles of vegetable matter are not to be found in unassisted nature.

It would seem that the *ortho-thermophile* organisms must be regarded as products of civilization, since the conditions for spontaneous rise in temperature will hardly occur except in technical and agricultural installations. The sun's heat cannot have been a factor in the development of the life-habits of these organisms, since it is inseparably associated with light and drying action, each of which is destructive to low forms of life.

So we must assume that agriculture, piling up heaps of dead matter, finally caused the evolution of germs that could only live at high temperature. They evolved from germs that inaugurate decay by promoting oxidation, fitting themselves to live in the rising heat. Spores of these settle everywhere and as soon as their favorite thermal point is reached they begin their life cycle.

But this explanation does not cover the astonishing case of the hay-infusion germ, *Bacillus Subtilis*. The spores of this germ resist a *boiling* temperature for several hours. To meet what conditions, natural or artificial, could they have evolved that? STUDENT

The Choralcelo

THE new musical instrument, the choralcelo, appears to offer more opportunity to the soloist than any yet invented, the organ not excepted. For theoretically it contains them all, and in its further developments may actually and fully do so. It is a piano and the usual hammer mechanism is provided for obtaining the piano quality. But in addition each wire can be as sharply *pulled by an electro-magnet* as *struck* by the hammer. An electro-magnet is a bar of iron that becomes a magnet as often as an electric current is made to run round an encircling wire, ceasing to be one as soon as the current ceases. In the choralcelo this make and break of the current can be done as often as is required for the highest musical notes—some thousands per second. The piano wire opposite each bar of iron is suddenly pulled as often as that becomes a magnet and as suddenly let go. As the succession of pulls can be held uniform, or made more or less forcible, the resulting note is either sustained or strengthened or weakened in its continuity.

A note sounded upon one instrument differs from the same note upon another. The fundamental or main note is the same. The difference is due to the overtones, subsidiary vibrations of increasing rapidity superadded to the fundamental, not interfering with, but enriching and qualifying it. In the choralcelo the successive main pulls of the electro-magnet can be enriched by superadded slighter pulls of any frequency. STUDENT

Nature

Studies

The Moon and Potatoes

THE Department of Agriculture has carried out experiments, described as patient and exhaustive, to ascertain if there is anything in the wide-spread belief that potatoes should be planted in the dark of the moon; and claims to have burst the belief by demonstrating that potatoes can be grown equally well whenever planted.

But this does not necessarily confute the belief, or any of the similar beliefs about lunar and planetary influence and vegetation. Some astrologers can refer to experiments of their own in support of their beliefs.

As there is no reason to suspect the good faith or capacity of either party, it is reasonable to assume that both classes of experiments were genuine, and that the result in both cases was influenced by the mind of the operator. The mind of the operator, who is so close to the plants and handles them and watches their growth, must surely be a more potent factor than the influence of the moon, though still the moon may have an influence.

Again, it may reasonably be contended that the Agricultural Department did not know how to work the thing properly, especially if they were trying to prevent the experiment from succeeding. Merely putting the "eyes" into the ground at a certain time is not enough, one might say; the sower must also know how to bring the lunar influence to bear. He may have been ignorant of some trifling yet essential detail. If an ignorant gardener were to plant potatoes, he might sow the pieces without eyes, and throw the eyes away; but his failure to raise a crop would not demonstrate anything but his own ignorance.

In conclusion, we may take it as proven that potatoes can be grown regardless of lunar influence; but it is not proven that they cannot be grown — and perhaps better — *with* lunar influence taken advantage of by an adept.

California's Big Trees Preserved

THE signing of the bill for the creation of the Calaveras National Forest, California, saves for all time this most famous grove. For more than nine years California people have been working to interest the Government in the Big Trees. Several bills had failed, when at last an arrangement was made to satisfy the owner of the grove by granting him Government timber in return.

Lomaland Photo. and Engraving Dept.

A MONARCH OF THE WOODS
OLD TREE NEAR ARNHEM, HOLLAND

WELCOME NIGHT

NOW o'er the drowsy earth still Night prevails,
Calm sleep the mountain tops and shady vales,
The rugged cliffs and hollow glens;
The wild beasts slumber in their dens;
The cattle on the hill. Deep in the sea
The countless finny race and monster brood
Tranquil repose. Even the busy bee
Forgets her daily toil. The silent wood
No more with noisy hum of insect rings;
And all the feathered tribes, by gentle sleep subdued,
Roost in the glade, and hang their drooping wings.

Alcman; translated by Mure

Thus there is an exchange and no appropriation has been necessary. The land includes 960 acres in the North Calaveras Grove in Calaveras County and 3040 in the South Grove in Tuolumne County. The former contains 93 sequoias and the latter 1380; and the count excludes trees under 18 feet in circumference or 6 feet through. There are also hundreds of sugar-pines and yellow pines

ranging to a height of 275 feet and often attaining a diameter of 8 to 10 feet; and many white firs and incense cedars.

Ten of the trees in the North Grove have a diameter of 25 feet or over, and more than seventy a diameter of 15 to 25 feet. The "Father of the Forests," now down, is estimated to have had a height of 450 feet and a diameter at the ground of more than 40. Trees of this order grow each as much lumber as is ordinarily grown on 15 or 20 acres. The bark runs from 6 inches to 2 feet thick.

H.

Resources of Asia Minor

ASIA Minor, between the Persian Gulf and Smyrna, is one of the richest territories in the world, so far as mineral resources are concerned. In the Vilayet of Smyrna there are about 60 miles being worked under firmans and 75 under licenses. On the shores of the Black Sea the coalfields of Heraclea form a source of vast potential wealth. The beds extend for nearly 40 miles along the shore and run inland. The seams are thick but contain many impurities and need much screening. In other parts there are extensive deposits of oil and bitumen, but want of proper communication has prevented their exploitation. Should the plan of Sir William Willcocks, to irrigate the plains of the Tigris and Euphrates, succeed, Turkey may become one of the great cotton and grain countries

of the world. Lack of workers should not exist if the plains were rendered fertile, for there is over-population elsewhere. A German company has a concession to irrigate the plain of Konia, and a canal of 90 miles in length will soon reclaim 170 square miles of the best agricultural land in that district. The plain of Adana is also to be irrigated for cotton.

Vast forests cover the interior mountain ranges. In the vilayet of Smyrna there are 1,600,000 acres of valuable woodland — larch, oak, boxwood, pine, cypress, and cedar; in Adana, 1,200,000 acres. But immense quantities are consumed in making charcoal and the timber is never replaced.

Is it not clear, that with the Turkish people awakening to a new order, this rich country will be reclaimed from its long slumber? And may the efforts of West and East combine to prevent the fearful extravagance which must have caused the former desolation and would so soon cause another.

Students'

Path

Sowing and Reaping from a Theosophical Standpoint

WHAT dignity there is in the vocation of a farmer! For countless centuries the deer and bison, the bears and prairie wolves roamed over the continent. Forest remained forest, swamp continued swamp. Shrubs, weeds and flowers unprofitably gay sprang up from year to year. Then the white settler came and, casting his eyes over the region, selected each a tract of land. Forests were cut, swamps were drained, crops were planted, the whole face of nature changed. The farmer is the providence of his estate, the creator of his farm. His courage and perseverance are derived simply from a conviction of the uniformity of natural law. He knows that if he plants turnip seed he need not fear a crop of niggerhead cactus, nor if he plant potatoes does he indulge the hope for Bartlett pears. Why should not you and I deal with life on this simple principle and face the problems of existence with the same certainty of success? Why should we not determine on our own future and deliberately bring it to pass?

Now every Christian professes to believe that whatsoever a man soweth that shall he also reap. He finds it in his Bible, he believes that he ought to believe it, and he believes that he does believe it; but he does *not* believe it, and he never *can* believe it until he restores to his creed the forgotten doctrine of Reincarnation.

Christians believe that babies are brand new individuals created by God and sent to gladden the hearts of their parents, and yet we find babies reaping from the moment that they enter upon life. The mother is kind or careless, the baby is well or sick, the baby has good food or is starved — all this diversity of destiny from the start. The baby is visibly reaping, yet the Christian scheme admits of no previous seedtime.

Is a baby's soul a new thing? No. Turn to the 1st chapter of *Ecclesiastes*, and you will find the following:

There is no new thing under the sun. Is there anything of which it may be said, Behold this is new? It hath been long ago in the ages which were before us.

A baby reaps because in previous lives it sowed the seed. Inequalities of human beings are accounted for by the pious Christian by saying, It is the will of God. The irreligious materialist will tell you it is blind chance with neither gods nor devils to guide it. Theosophy says man's destiny is self-made and the good or evil we experience are the effect of causes generated by ourselves. This doctrine of moral causation makes for manhood, for responsibility, self-reliance, dignity, assurance, calm. Any other explanation of life's problems makes existence a game of chance, a lottery, a terrible "perhaps."

There may be some of my readers smarting under a terrible blow. A bolt has fallen from the blue and his castle of cards is in ruin. He feels like shaking his fist at the irresponsible heavens above his head and breaking out into bitter complaint. Hear the words of H. P. Blavatsky:

Verily there is not an accident in our lives, not a misshapen day or a misfortune that could not be traced back to our own doings in this or another life.

The Theosophist has one great advantage over the Christian. A Christian may have been born in easy circumstances, when suddenly as sometimes happens there comes a reverse of fortune — disease, accident, loss of wealth, or something else which he piously ascribes to the inscrutable dealings of Providence. But as the previous easy comfortable lines were also due to Providence and were in no way connected with his moral deserving, why may not the afflicting rod of the chastening of the Lord be applied to him for an indefinite duration; why, indeed, if governed by mere caprice, should the castigation ever cease? Theosophists believe that evil harvests are exactly proportionate to the sowing, and however bad they may be, they know that every day witnesses the reaping of weeds which, once laid low, will never rise again from the same seed.

This is a gospel of hope that straightens a man's backbone, that stiffens his muscles and gives indomitable courage. He may have turned his estate into a wilderness, but at any moment he may change his cultivation and begin the planning of a Paradise whose beauty and usefulness know no limit.

The outward aspects of men's lives are very deceptive and the actions they do and the lives they lead often indicate little as to the quality of seed. The real seeds are thoughts and the field we sow them in is the mind. Here we have a drunkard making desperate struggles to reform his life. He often finds ingrained habit too strong for his weak will. He is often overtaken by failure. But if his lapses are not deliberate but are merely failures after a hard conflict, and if he rises up after each overthrow and once again renews the struggle, such a man is sowing seed for a glorious future harvest.

Another man apparently pursues an even course of virtuous living, outwardly upright, clean, respectable, he goes along his way without the slightest effort treading the dead level course which he has reached by past achievement. He is respectable from habit, and because any moral backsliding would damage his reputation, which he values as a social and a commercial asset. There is many a well-groomed, clean-skinned, well-dressed man walking the streets of our cities today who passes among his friends as a pattern of propriety, but whose thoughts and desires pollute the moral atmosphere like a psychic cesspool.

One curious fact about seeds is their wonderful power of lying latent for years, hidden in the soil apparently lifeless. One day deep ploughing or the stroke of a spade brings the seeds to the surface, and under the influence of sunshine and rain they sprout into that vigorous growth which has been retarded through lack of opportunity. During our long pilgrimage life after life we have acquired tendencies, abilities and powers which are stored away in our characters unknown to ourselves

or our dearest friends. Musical ability for instance may be possessed by a soul who life after life is drawn to incarnate among hard-working, illiterate peasants, but owing to lack of opportunity and the absence of musical brain and nervous organization the latent talent remains hidden.

It may be that some one who reads has been discouraged by the sudden starting into life of evil tendencies which he had no idea he possessed, and has been the more surprised at their appearance inasmuch as he has recently been making more strenuous efforts to reform his life and to conform his living to new and purer ideals. There is nothing however in these unlooked for revelations to warrant misgiving or alarm. The seeds now sprouting into active life have been present all the time though unsuspected, and there is rather a reason for congratulation because now you know what you have to deal with, and now you have the chance of cancelling old debts, of hoeing up weeds which have been all along concealed beneath the soil.

There is something awe-inspiring in the omniscience and perfect memory of the Great Law which encompasses us round about. A few oats or grains of corn scattered by horses feeding by the roadside may be overlaid by the dust and trampled underfoot and completely passed away from human memory. All through the heat of summer it has lain concealed; but on the first fall of rain in September a vivid green patch of tiny spears of grain shoots up and then one recollects the long-forgotten cause. But the Silence and the Darkness knew. Each wavering, momentary thought that flashes on the mind and disappears like lightning is a cause and is stored up infallibly and must produce its own effect whenever the conditions favor its manifestation. A holy hermit may retire to a cave in a jungle and nourish his thin stream of life on rice and water. He may spend his day in chanting psalms, and hold himself aloof from all contaminating influences and human society of any description, yet, unless he has his imagination and his thoughts under perfect control he may be generating causes which will plunge him into the very maelstrom of vice and passion in some succeeding life on earth.

Thoughts are pregnant seeds with which we mold our future lives for centuries ahead, yet most of us reckon but little of our responsibility in the matter of thought control. We ramble easily along the pathway of existence wishing with a certain amount of eagerness to have a good time and more or less desirous of avoiding disagreeables if we can achieve this end without undue exertion. We feebly respond to the influence of our higher nature in its periodical descents into our consciousness and are easily led down again by the lurid glow of passion and desire when, under cyclic law, these are in the ascendant. And so our lives are so terribly *checkered*. The feeble efforts after righteousness result in a brief spell of favorable times, only to be followed by the miserable harvest resulting from sowing as the brutish part of our nature dictates.

Why not from now resolve to end such foolishness, such aimless irresolution, and determine by the aid of the warrior to produce good causes for future lives?

P. L.

THE LOST OCCASION

FAREWELL, fair day and fading light!
The clay-horn, here, with westward sight,
Marks the huge sun now downward soar,
Farewell. We twain shall meet no more.

Farewell, I watch with bursting sigh
My late condemned occasion die.
I linger useless in my tent;
Farewell, fair day, so foully spent.

Farewell, fair day. If any God
At all consider this poor clod,
He who the fair occasion sent,
Prepared and placed the impediment.

Let Him diviner vengeance take—
Give me to sleep, give me to wake
Girded and shod, and bid me play
The hero of the coming day!

Robert Louis Stevenson

THEOSOPHICAL FORUM

Conducted by J. H. Russell

Question Do you believe in a last judgment, a final judgment day?

Answer An answer to this question appeared in the CENTURY PATH for May 9, 1909, but there are some further points of interest that have not been touched upon, which I would like to call attention to.

First it would have been well if the inquirer had made clear exactly in what sense he used the term "last judgment"; but in absence of any definition we are at liberty to assume that it is used in the generally accepted orthodox sense of the churches that at "the second coming of Christ" all the inhabitants of the earth will be brought before the judgment seat of God and there receive judgment, some to receive the blessing of God and to enter heaven, the others to be consigned to hell and its torments for ever; furthermore, that this judgment is irrevocable and final and that from the latter place or state there is no escape.

There are certain biblical texts which are quoted as authority for this view; one notable passage occurs in *Matthew* xxv, 31 as follows:

When the Son of man shall come in his glory, and all the holy angels with him, then shall he sit upon the throne of his glory.

And before him shall be gathered all nations: and he shall separate them one from another, as a shepherd divideth his sheep from the goats:

And he shall set the sheep on his right hand, but the goats on the left.

Then shall the King say to them on his right hand, Come ye blessed of my Father, inherit the kingdom, prepared for you from the foundation of the world. . . .

Then shall he say also to them on the left hand, Depart from me ye cursed, into everlasting fire, prepared for the devil and his angels.

It is further generally held by the said orthodox churches that this final judgment depends upon the acceptance or rejection of Jesus Christ as the one and only Savior.

Now what is the teaching of Theosophy in regard to this? The whole subject is full of the deepest interest, for if indeed there be a final judgment, it is surely of the utmost importance for us to know it and to be prepared for it, if that be in our power.

Theosophy does teach a last judgment and that there is much truth in the saying of Jesus quoted above, though the latter has been wrongly interpreted, and furthermore that it is in our power to meet it.

There are many last judgments, i. e., so far

as regards the life or period just ended, and in each, in a sense, the sheep are separated from the goats.

There is first a last judgment for each one of us when we die. At the moment of death, and this has been the experience of many who have been resuscitated from drowning, the whole life is passed in review, and the soul sees where it failed and where it fulfilled its sacred mission, and recognizes the justice and the mercy of the judgment of the Law from which there is no appeal. And the soul and all the spiritual part of the nature are separated from the lower elements. The former pass into the rest and bliss of Devachan or heaven, while the latter in part go back to the storehouse of nature, and in part, as skandhas, (personal attributes) await the soul at the threshold of Devachan to be taken up by it again on its re-entry into existence on earth.

But we do not live only our individual, apparently separate lives, but also share in the collective life of the race. So too there is a last judgment for the race as for the individual man.

Tradition records the destruction of continents and races, and it is one of the teachings of Theosophy, the Wisdom-Religion, that such periodically occurs when the race has lived out its life cycle. At such time all those who have reached a certain point of spiritual development pass on to the new race that is born from the old one. Thus in the stanzas of the *Book of Dzyan*, on which Madame Blavatsky's great work *The Secret Doctrine* is based, is the following statement in reference to the destruction of Atlantis: "All holy saved, all evil perished."

The teaching of Theosophy is that gradually the whole of humanity is being welded into an organism and that those individuals whose selfishness and evil cannot take part in the wider life, must wait until another great life-cycle when another opportunity may be theirs.

Thus it will be seen that the last judgment does not mean something final and irrevocable throughout eternity, but that at each stage or period of life we are judged by the Law.

Every moment is a moment of choice, either to work with the Law, or against it, and as we choose each moment, so do we build up our character and render inevitable the final judgment; either to go on to greater heights of being, or to have to start to climb anew, living not in any orthodox hell, but in the hell of our own desires until once more there awakens in us the determination to rise.

The same idea is contained in the Gospels, for the words that are there translated *end of the world*, *eternity*, and *for ever and ever*, are incorrectly rendered and should be instead, "consummation of the ages," "an aeon of time," etc. This brings the Gospel teachings in this particular much more closely into harmony with Theosophy.

One important fact becomes immediately evident on taking up the study of Theosophy with reference to this subject, namely that whereas the orthodox teaching of a last judgment has been used as an instrument of fear for the enslavement of the human mind, the Theosophical teaching is the doctrine of hope, as well as of impartial and absolute justice. In the one case there is the teaching that one short life of 30, 50, or 70 years, irrevocably

determines the unthinkable stretches of eternity either of heaven or hell; in the other case there is life after life on this earth, new opportunities, fresh seed times.

One life taken by itself may seem a failure, and if we were thus to be brought to the last judgment we might well despair. There is a judgment, a balance struck, it is true, and we must reap what we have sown; reap, not only the harvest of evil, but also of good—little though it may seem to us at the time. Yet chance after chance is given to us and new strength with every effort that we make. Re-incarnation is the doctrine of hope and through it we know that we apportion to ourselves what our future shall be and thus eventually what the last judgment.

It can easily be shown that Jesus taught this absolute justice, and in view of the fact that we have so few of his actual sayings, and also of the fact that the Gospels have passed through many hands and suffered much editing and many mutilations, are we not fully warranted in putting aside as contrary to his actual teaching anything that conflicts with strict justice or that conflicts with his own compassionate and noble character?

Let us take then his statement as to the justice with which all things are weighed in the balance. "With whatsoever measure ye mete, it shall be measured to you again." What act or series of acts, even extending throughout a whole lifetime or several lifetimes—all limited, all finite—can merit the damnation of the tortures of hell throughout eternity? No wonder that sane men, exercising their divinely endowed faculties of reason, reject such a soul-killing dogma, reject such an idea of God as that infers.

"With whatsoever measure ye mete, it shall be measured to you again," said Jesus the Christ. "Be not deceived, God is not mocked, for whatsoever a man soweth, that shall he also reap," said Paul. "The effect is equivalent to and balances the cause," says Theosophy.

There is another teaching of Theosophy that must be understood if we are to answer fully the question as to the "last judgment." First, that man is dual in his nature; that he has a higher, divine nature, which is the spiritual Soul, or divine Ego, his real *Self*; and also a lower, animal, terrestrial nature with its passions, desires, and appetites; and that there is a continual warfare between these two natures until one or the other becomes complete master. The higher nature is immortal, the lower nature is mortal.

Taking all these teachings, applying them understandingly, so far as we are able, to our lives, the whole of life takes on a new meaning. No longer are we puppets vainly striving against adverse fate, or suppliants for divine favor and mercy; but verily men, divine in essence, of divine origin and infinite possibilities, the fashioners and arbiters of our own destiny.

STUDENT

THERE is one eternal Law in nature, one that always tends to adjust contraries and to produce final harmony. It is owing to this law of spiritual development superseding the physical and purely intellectual, that mankind will become freed from its false gods, and find itself finally SELF-REDEEMED.—*The Secret Doctrine*, II, 420 (H. P. Blavatsky)

THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY

FOUNDED AT NEW YORK CITY IN 1875 BY H. P. BLAVATSKY, WILLIAM Q. JUDGE AND OTHERS
REORGANIZED IN 1898 BY KATHERINE TINGLEY

Central Office Point Loma California

The Headquarters of the Society at Point Loma with the buildings and grounds, are no "Community" "Settlement" or "Colony." They form no experiment in Socialism, Communism, or anything of similar nature, but are the Central Executive Office of an international organization where the business of the same is carried on, and where the teachings of Theosophy are being demonstrated. Midway 'twixt East and West, where the rising Sun of Progress and Enlightenment shall one day stand at full meridian, the Headquarters of the Society unite the philosophic Orient with the practical West

The "Evolution" of Morality

THE greatest sin which man can commit is to deny the divinity within, for this is the first step towards repudiating it and hence abandoning himself to animality. The denial is really absurd, because it is only by virtue of that divine origin that man has the intellectual faculties necessary to think about such a subject at all; so that, in denying his divinity, he at the same time affirms it. But it is possible for man, divine in his origin and with an intellect enlightened by contact with the divine, to cut himself off from his divinity and enter upon a path of animalism that will end in his destruction.

Modern science has to a great extent attempted to deny the divinity of man. Its evolution theories have sought to account for growth and development in some other way. These theories have entered into everything. We have a science of the evolution of the moral sense, according to which it is supposed that man, in the course of his evolution up from the lower kingdoms, evolved a moral sense.

Here, for instance, is a review of a book on the origin and development of moral ideas—two large volumes, 1500 pages. The reviewer thinks the author has not sufficiently assorted his facts, but has piled them up in such masses and in such a way that he has failed to make it clear that there is any such evolutionary process in morals. One is quite willing to believe that the thesis could have been better supported by a judicious assorting of the facts. Other theorists anxious to prove similar theories have found it advisable to marshal and sift their facts. In short, this author appears to have been too liberal with his facts and to have given too little proportionate space to his theory, so that the reader is left to choose between the two.

The idea is that morality and ethics arose from the family instincts, finding its primitive stage among the animals with their instincts. It is perhaps unnecessary to point out that morality often acts contrary to the family instincts, causing people to abandon family ties and obligations in the interests of some wider ideal.

Our philosopher does not show the slightest ability to discriminate between the various grades of motive in man. He confuses animal instincts with moral ideas in a way that shows

MEMBERSHIP

in the Universal Brotherhood and Theosophical Society may be either "at large" or in a local Branch. Adhesion to the principle of Universal Brotherhood is the only prerequisite to membership. The Organization represents no particular creed; it is entirely unsectarian, and includes professors of all faiths, only exacting from each member that large toleration of the beliefs of others which he desires them to exhibit towards his own.

Applications for membership in a Branch should be addressed to the local Director; for membership "at large" to G. de Purucker, Membership Secretary, International Theosophical Headquarters, Point Loma, California.

him to be quite inexperienced in the analysing of human nature.

Moral ideas arise from the union of the divine and the animal in man. The animals do not have them. The first man did not have them until the Gods incarnated in him, and then he became conscious of his animal nature and ashamed of his lower instincts. Before this awakening, it was no sin for him to follow his promptings, any more than it is with the animals; but with his awakening mind, he could no longer follow them innocently. Morality arises out of the continual necessity which man feels for adjusting the two laws of his being, the terrestrial and the Spiritual.

As to evolution, the animal Monad (not the physical forms of animals) passes upward through various stages until it reaches the highest point in the animal kingdom. But it cannot become man, though it will enter into the composition of man. For the making of man, other elements are necessary; and all ancient anthropogonies tell of the descent of the "Gods," who imparted their divine essence to the "mindless" man, thus making him "as a God," like unto themselves. This is the origin of morality. Mere parental or amatory or self-protective instincts will not account for it.

There would be little harm in these foolish theories did they not lend themselves to mistaken ideas as to duty and obligation. They give color to the idea that morality is not binding. It may be true that moral codes differ with different races and ages; but the underlying spirit does not differ; nor are we expected to follow the moral ideas of other races and ages except in so far as they represent the unchanging spirit. Morality does not spring from experience or tradition or expediency, but from the promptings of our divine nature; and we must either fulfil the law of our being, by constantly striving to sublimate and perfect our life, or else sink lower and lower into animalism.

STUDENT

A Prayer to the Beyond-Sun

*Unveil, O Thou that givest sustenance to the universe,
From Whom all proceed, to Whom all must return,
That face of the True Sun now hidden from us by a veil of golden light,
That we may see the Truth and do our whole duty
On our journey to Thy Sacred Seat.*

THIS is an old Vedic prayer. Whatever its writer may have meant, it is sometimes used now in India as a mental pathway inward to the Sun of individual life.

O Thou that givest sustenance to the universe: the invocation is addressed to the universal divine Presence.

That face of the True Sun: the individual spiritual inner Sun whose light fills the heart of the awakened man.

Now hidden by a veil of golden light: that light of physical vitality which underlies sensation and physical desire, a vital light almost visible in the clear face of the healthy child. In moments of meditation one must get beyond this light, cease to pulse with it or feel it, look through it, as it were, to the spiritual center within it, that center which is true Self. Then are fulfilled the conditions for the rest of the prayer:

That we may see the truth and do our while duty on our journey to Thy sacred seat.

As, when some calamity is impending, the man awakes with a sense of dread or weight for which he cannot at first account, and as he will feel this presence all day even when his mind is occupied with others matters: so the man on this pathway who is finding the answer to this prayer, wakes with a sense of inner peace and joy for which he cannot account and goes through the day as one who has been told tidings of great joy. At last he comes to know that being of himself whose light is that joy. Then he no longer lives in the endless pictures of memory and anticipation with which ordinary lives are filled. They no longer pass of their own will before his mental eye. He is reborn.

STUDENT

TRULY a robust "faith" is required to believe that it is "presumption" to question the justice of one, who creates helpless little man but to "perplex" him, and to test a "faith" with which that "Power," moreover, may have forgotten, if not neglected, to endow him, as happens sometimes.—H. P. Blavatsky

THE THEOSOPHICAL ADDRESS AT ISIS THEATER

LAST Sunday, the subject "Is Life Worth Living," Answered by Theosophy," was treated by Mr. C. J. Ryan. He said that Theosophy definitely answered the question in the affirmative. It showed how the freshness of the morning of life need never leave us if we lived in obedience to the Higher Law of our being. To bring this ancient teaching of Universal Brotherhood in a way that would appeal to the spirit of this age was part of the work of the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY. In the words of H. P. Blavatsky:

If man by suppressing, if not destroying, his selfishness and personality, only succeeds in knowing himself as he is behind the veil of physical nature, he will soon be beyond all pain. . . . Such a man will be physically of matter, and yet he will live beyond and outside it . . . he will experience everlasting life even when in temporary bodies of short duration. All this may be achieved by the development of unselfish universal love for humanity and the suppression of personality or *selfishness*, which is the cause of all sin and consequently of all human sorrow.

Two equally unsatisfactory theories prevail today about man's place in nature. One tells us that the soul was created at birth and entered into conditions for which it is not responsible, and yet that the few short moments of one lifetime will decide its future weal or woe. The second hypothesis is that man is merely a higher animal and that he perishes utterly with his body.

Neither of these theories sees anything deeper in man than the limited personality of ordinary life; but Theosophy proves that he is far more, and that the steady performance of duty creates a spiritual atmosphere in which the higher nature can illuminate the personality. The deeper scientific study of Theosophy, which includes not only the generally known and published teachings of H. P. Blavatsky given to her pupils during her lifetime, but other teachings given by her only to William Q. Judge, and also the teachings now being brought out by Katherine Tingley, which could not be given earlier because the students were not sufficiently prepared, forms a most important part of the life at Point Loma. As a result of the practical living of the Theosophical life there, there is a certain quality associated with the execution of even the simplest duties which makes anyone who spends a little time at the International Theosophical Headquarters feel that the art of living has acquired a new tone under the guidance of Katherine Tingley. The harmony prevailing has been brought about by the simplest means, and what has been done through the faithful carrying out of the principles of Theosophy can equally well be extended into wider spheres, for the students represent the most diverse nationalities. OBSERVER

ALL worlds up to that of Brahmā are subject to rebirth again and again, but they who reach to me have no rebirth. Those who are acquainted with day and night know that the day of Brahmā is a thousand revolutions of the yugas and that his night extendeth for a thousand more. At the coming on of that day all things issue forth from the unmanifested into manifestation, so on the approach of that night they merge again into the unmanifested. —*Bhagavad Gītā*

The Specter of Insanity

One of the States in the West is paying more than a million dollars a year for the care of its insane in four infirmaries, and even then it has not enough room for its citizens whose minds become deranged. Practically every state has its asylums full and the private sanitariums are accomodating large numbers which are daily growing larger still.—*Pathfinder*

The increase of insanity is actually alarming. . . . It is alleged that insanity increases faster in the United States than in any other country, and that a greater per cent of the population here are laboring under one form or another of this disease than in any other country.—*Washington Post*

IT is the belief of many serious-minded men that our civilization is on the high-road to self-destruction by the momentum of its own destructive forces, unless a powerful remedial and constructive agency come into play. Facts like the above amply confirm the truth of the belief. First we have the fact, daily growing more portentous, that insanity is increasing—accelerating in its increase. Next we have the facts that the cause of this increase is not understood and that no steps are being taken to prevent it. These three facts fully justify the opinion. The *Washington Post* continues:

That insanity is, in part, a hereditary disease has been proved time and again, and attempts have been made to control marriages of parties where insanity has been known to exist in their families. But persons bent on marriage laugh at all such pleas, leaving their posterity to suffer. Alcohol, cigarette smoking, opium, cocaine, strenuous life, religious enthusiasm, and a hundred other excesses claim their victims and aid in filling the insane hospitals. . . .

But in the face of all this there seems to be no organized effort being made to inquire into the cause of the increase of insanity and to take steps leading to a remedy. It is estimated that a thousand homicides are committed in the United States every year by persons laboring under insanity. They cannot be punished for their crimes. The only resource is to confine them. Worse even than the crimes of the insane are those of sane persons who pose as insane in order to escape punishment. The dividing line between sanity and insanity has been obscured by criminal trials, and sometimes it appears as though insanity were the most popular fad in the country. The melancholy fact remains, however, that the cases of undoubted insanity are rapidly increasing, and that little action is being taken to stem the tide.

Now as to the cause of insanity. It is idle to evade the real issue and attribute insanity to this or that particular form of wrong-living. These particular vices are only the details. Insanity is the culminating symptom of *loss of self-control*. By loss of self-control is it caused, and by want of self-control in minor degrees is the way to insanity paved. Many of these minor degrees have been enumerated: cigarette smoking, alcoholism, drugging, etc. Others have not been named. It is one of the most horrible features of our civilization that the most deadly evils may not be discussed or even mentioned by name. Yet there are evils that are worse than those enumerated, and that are, in fact, in most cases the direct provocative cause of the drugging, alcoholism, etc. Stimulants and narcotics are taken in the hope of repairing, deadening, or obviating debility and unbalance produced by these more insidious causes. These causes are prevalent to an almost universal extent, and their ascendancy is sapping the vigor of the race in its most vital spot and menacing the continued existence of our civilization with sure and certain annihilation, unless frustrated. Parents try desperately to hoodwink themselves into the

belief that such things do not exist—at least in the case of their own children. Doctors know, but they too are fain to adopt the ostrich policy. Teachers know—to their sorrow, when they are blamed for not being able to make men and women out of debilitated neuropaths.

Thus we have a most destructive evil, gnawing like some insect pest at the inner core of life; it is insidious and can not be coped with; it grows with accelerated momentum; it breeds other vices and leads to insanity; and insanity leads to crime.

The reason why we can not cope with this evil is that we do not begin at the beginning; we are striving to kill the weed by cutting it off level with the ground, leaving the enormous ramifying root still alive. And what is that root? It is the lack of self-control. The subordinate elements of our make-up have acquired a rank independent vitality and have broken loose from the control of the will, so that our bodily and mental functions are run by them and not by the intelligent will. What has brought about such a state of affairs? It is the outcome of long continuance in wrong habits of life, handed down in ever-increasing intensity from generation to generation, gaining new power with each fresh generation, so that the children are weaker than the parents. These wrong habits consist in self-indulgence in a great variety of forms; yielding to the passions of anger, sloth, lust, appetite; the pampering of oneself by indolent habits, the coddling of oneself by luxuries and medicines, the giving way to habits of mind-wandering and castle-building, and other habits mentionable and unmentionable. All these have a cumulative effect, which grows with each generation.

And to counteract these effects we have practically nothing on the other side. The agencies that should counteract them and teach us self-control have failed most miserably in their duty. Christianity in *all* its forms, presents the sorry spectacle of a tottering wreck and is too much concerned about keeping its own miserable frame together to teach anybody anything; it looks to us for support, instead of supporting us. And science is blundering and guessing and speculating and contradicting itself—and failing, with the best of intentions. While all these tremendous causes of evil are at work everywhere, in the mind, in the body, science is looking for germs and inventing other germs to kill them. It throws its feeble spadeful of sand at the oncoming flood, which forthwith takes a new channel.

Unless we find some means of learning discipline and self-control, *from ourselves*, not by leaning on another or on the Church, our civilization is most certainly doomed.

And the prime requisite is *knowledge*; what can be done without knowledge? But in place of knowledge we have theories, wild speculations, doubts. But Theosophy stands on sure ground. Let but the present career run on a little longer and the evils will have grown so frightful that the people will look everywhere for help. And Theosophy alone will be able to afford it. For Theosophy has the key to self-control. Its teachings about human nature are founded on the wisdom of ages, and their truth is demonstrated by their practical efficiency. Theosophy alone can show

the victim how to find *within himself* that Power which shall enable him to take a firm stand and grasp his nature; it can show humanity how to call to its aid its own innate Divinity. This is what the churches have failed to do, what science has failed to do. It is the only thing that can save us from this terrible downward rush into insanity and chaos.

But one thing remains to be said; and that is that there are many agencies at work which, under the guise of remedial agents, are positively aiding the work of destruction. Cults falsely claiming the name of Theosophy, "psychic" movements, "mental therapeutics," and so on, are teaching people to fool with their minds and nervous systems in new ways; in some cases even teaching questionable habits under the pretense of offering a cure for worse evils (!). All movements for developing the subtler powers of man, unless firmly grounded on the loftiest principles of purity and solidarity, can only add to the momentum acquired by the evil forces of desire; for they afford new ways of gratifying desire. But the people are so starved by religion and science that they are flying to these quack medicines like famished people to rotten food. Great, then, is the need for spreading the knowledge of Theosophy; the true food that contains no poison.

TRAVERS

The Nervii

FROM the accounts of the wars of the Romans we obtain occasional glimpses of the degree of civilization of their foes which belie the old conception of their savagery. The ceremonial blue of the Druids wherewith they stained their bodies showed a knowledge which we should be glad to possess, judging by the universal craze for following anyone who claims to possess such knowledge and our ignorant imitations. When the Romans came into collision with the Druid power in the south of France they left 112,000 of the best soldiers of the Roman Empire dead on the field, which shows that their legions had to deal with no mere savage foe in war. In peace, Caesar's little sketch of the Nervii who so nearly succeeded in overcoming him, gives another glimpse of their customs, such as we find today that we cannot attain to in the way of national self-control, which is of course, another word for civilization.

Caesar says:

Traders have no admittance to their territory. They allow no wine or other thing to be brought in which they consider would relax their minds and decrease their valor. These fierce men are of great courage; they reproached the rest of the Belgae who gave up the fatherland and abandoned their bravery; they would neither send ambassadors nor accept any condition of peace. (*Comm. de Bell. Gall. Lib. i, c. xv.*)

The trader and the missionary are yet problems with us, and it is a wise nation that keeps them out as do the Tibetans. Bibles and guns are seldom far apart. Luckily the Nervii had no missionaries to deal with, but they suffered with the rest of their countrymen.

Supposing we shut out all alcohol and all harmful drugs, and learned as a nation not to think we need such substitutes for moral strength, and became a sturdy race of healthy human beings without a single patent medicine advertisement in our papers. We cannot do it — because we are civilized. So we have pro-

hibition laws that do not prohibit; we have knowledge which we have not the national courage to enforce nor the national self-control to use, as had the Nervii of old Gaul. So let us drop the subject and talk of something more interesting — say, the blessings of being civilized, and of living in such advanced times.

And yet—is there nothing in Reincarnation? Could not we ourselves have been there among the Romans when the prohibition problem and the trader farce had already gone far to ruin those whom the Romans conquered, as they afterwards ruined the Romans? Can these problems be merely old friends once more among us to learn to recognize as enemies and conquer? Or shall they await another couple of millenniums and again face our drug-soaked remnants of European civilization, or psychically-festering "humanity"?

Strange how we — how the world — progresses back to the same place as before! But always *plus* something. Alcohol first; next alcohol plus morphine, and a few etceteras; lastly, perhaps, as suggested above, alcohol plus morphine plus "psychic powers," as their habitués love to call them, instead of giving them their true name of *prolapsus psychicus*.

P. A. M.

The Horseshoe for Luck

A WRITER in the London *Globe* speaks of the frequency of horseshoes nailed up over cottage doors for luck; of the use of this emblem as a personal ornament; and of the employment of floral horseshoes in weddings; but to the question, "Why should a horseshoe be considered lucky?" answers, "It is to be feared that our laudable craving for knowledge must remain unsatisfied." He mentions, however, the theory that the horseshoe represents the crescent moon, the symbol of Ashtoreth and Isis.

Truly, nobody with sound judgment would maintain that a belief in the efficacy of the symbol can be so prevalent and firmly fixed without being founded on some basis of fact. That basis of fact is simply that symbols *are* efficacious. But do not let us rush to an impetuous extreme and foolishly imagine that they are *always* efficacious; for there are wrong ways of doing things as well as right. To take an analogy — telegraphic symbols, shorthand symbols, chemical symbols, would be of no use to anyone ignorant of these arts. Hence the fact that a symbol may refuse to produce its expected effect in certain cases is no argument against its efficacy in other cases; nor is our ignorance of how to use anything a proof that other people cannot use it.

What is the use of a symbol? It is to evoke a power. There are many instances of this which are so familiar that we do not wonder at them and imagine that we have a full scientific explanation. For instance, a national flag or emblem may produce a tremendous effect, even to turning the tide of a great battle; but then we explain that on ordinary lines; it is the courage and enthusiasm of the soldiers that are evoked by the symbol. But can symbols ever evoke other powers — powers usually classed as occult or supernatural because we do not understand them?

The proper use of symbols to aid in the evocation of powers in nature is part of a forgotten science, the remnants and memories

of which we find all around us. Blindly we perpetuate the observances of this science, and cling to them despite our scientific theories. The knowledge of their underlying truth forms part of the mass of intuitive knowledge that follows man from generation to generation, being implanted in the racial consciousness. But it is one thing to execute merely the outer details of an observance, and another to perform it with knowledge; and a symbol in the hands of one ignorant of the means of making it available might be as useless as a wireless telegraph apparatus in the hands of a savage.

Doubt is often expressed as to which way the horns of the shoe should be turned, up or down; and the preponderance of opinion seems in favor of up. Both ways are symbolic, being connected with the dual nature of the mind and with the alchemical formula, *Solve: coagula*. If we must classify them as good and evil, the upward way would be the former, and the downward the latter.

STUDENT

"The Reality Behind the Screen"

IN a recent article in the *CENTURY PATH* on a theory of gravitation, it was said that the phenomenal world, as it appears to our physical senses, is like an image thrown on a screen, and that the reality behind the screen escapes our ken. Religion has used the convenient "God" to include all that lies beyond the reach of our present faculties; while science has sometimes contented itself with the word "Unknowable" to include the same things. And this habit of mind has even intruded itself into the ideas of some students of Theosophy, who seem inclined to make the "One Reality" responsible for everything that we cannot discern or comprehend. Of course, in such a view, the "One Reality" is simply our old friend "God" over again. There is no need to jump at one bound from human consciousness to the "One Reality," without any intermediate steps. When, by transcending the limits of our physical senses and acquiring the power to use finer senses, we penetrate beyond the screen of the phenomenal world, we shall find another world, wherein we shall discover the causes of many of the effects produced in the physical world. But these causes will, in their turn, also be the effects of other, still more recondite causes. "Veil upon veil," as the poet sings. We can never reach absolute reality (short of becoming entirely absorbed in the Infinite); everything is real in a sense, and unreal in another sense. So the cause of the effect called "gravity" may be, in the last analysis, the "One Reality," but there is no sense in making It directly responsible and thus turning It into a personal God. Already, if we postulate an ether, we can get an explanation of the attraction of atoms, which otherwise is inexplicable. Thus we have a partial explanation; but we need more explanation to explain the ether itself.

We should not try to reach too far with our present outfit of senses and ideas; because obviously a slight development in our faculties would present us with such an entirely new conception of the world that all our previous ideas would be upset. The road to knowledge lies through a perfecting of the means of knowing.

Art Music Literature and the Drama

The Morte D'Arthur—Part II

IN all the *Idylls of the King*, except the *Morte d'Arthur*, Tennyson goes no deeper than making Arthur a man, and constantly sinks him, with his knights, into rank modernity. The Nineteenth Century lay on Tennyson strongly; his urge was its problems and awakening of thought; he would not have been so true a teacher for his age otherwise. But you cannot force a demigod into such molds; the result will fall far short of real poetry. *The Two Voices* are well, and *Enoch Arden* and *Maud* are well, they mark a period, and the strength of their author. But the *Idylls*, for all their beauty and high teaching, are not altogether well; they are neither here or there, as you may say, and the future will hold that they mark his weakness. You might compare the Prince Consort, whose life inspired these poems, with Alfred the Saxon, for both were purehearted, noble, patriotic men; but neither of them with Arthur; neither of them can be thought of as wielding Excalibur, as carried in that dark barge to Avalon; "white samite, mystic, wonderful," is not the wear for either of them—nor for any personality.

The *Morte d'Arthur* is a mixture of all three ages. Parts of it belong entirely to the age of demigods, and are distilled of all its wonders and glory.

A broken chancel and a broken cross
That stood on a dark strait of barren land.
On one side lay the ocean, and on one
Lay a great water, and the moon was full—

There we have the full flavor of it, to pass immediately into the Middle Ages with the King's speech to Bedivere, and into modern times with this:—

I perish by this people I have made,—
Though Merlin sware that I should come again
To rule once more—but let what will be, be.

"*Though Merlin sware*"—as if the demigod could doubt that he would come again. "*Let what will be, be*"; the demigod never proposed that, but eternal warfare upon the demons; he never acquiesced in his doom nor their triumph. Dying, he foresaw always his return, and *no peace*; perhaps new defeats, victory postponed, maybe, for an immensity of aeons, but not the disgrace of peace; not the cessation of his demi-godhood. When the twilight of the gods should come, and all heaven topple, he would still be there to swing an axe for Odin.

Why were not Tennyson's men a part of such setting as this?—

And in the moon athwart the place of tombs,
Where lay the mighty bones of ancient men,
Old knights, and over them the sea wind sang
Shrill, chill, with flakes of foam.

The whole *mise en scène* is of the demigods; in such wild places was ever the sunset of their glory.

Bedivere should never have been tempted to hide the sword; the action and the subtle arguments that justify it smack too much of our own time. No doubt Tennyson was not

responsible; but the incident shows how little the *trouveurs*, in whose telling the story grew to this, understood the old demigod spirit. The knight flung forth Excalibur the first time, never doubt it; his brainmind was not so intricate and involved as to fashion such specious disloyalty. In the older legends Mordred himself is not subtle: he is a wilful, passionate rebel; a fallen demigod, lurid with great deeds and crimes; whatever else one might fall to, to be a sneak was impossible.

IN MUCKROSS DEMESNE, KILLARNEY

But the other swiftly strode from ridge to ridge,
Clothed with his breath, and looking, as he walked,
Larger than human on the frozen hills.
He heard the deep behind him, and a cry
Before. *His own thought drove him like a goad.*

How that last does cut into the immensity of the place, and shatter the enchantment! The fact is, that demigods do not think. The movements of their consciousness are actions broad and deep; the lights and shadows on it are the sunlight and the storm. There are three waves that broke and cried at no other time than when the High King of Eri fell, the panorama of the seas and skies always mirrored the moods of the demigods, and were the only way in which they might be spoken of. So what drove Bedivere forward was outside of himself; it was hearing the deep behind him and a cry before, and the multitudinous voices and urgings and lamentations that were in them; there was the whole of his unrest. We do not say that his own thoughts drove Orestes forward, but that the Furies drove him. The truth is that all these "larger than human" figures represent, not any human totality of body and soul and mind, not any individual human being, but some one human principle; as the mind, or the imagination, or the will, or the soul. Now it is to the whole sum of our being that our thoughts stand *as thoughts*. To the mind they stand as its actions; they are the actions of the mind,

as what we call actions are the thoughts of the body. So in the great demigod poetry there must be no talk of thoughts, but only of actions and environment. "His own thoughts drove him like a goad," tells us nothing in reality; it throws no bolt at the imagination, nor admits us into any realm or secret of consciousness. But lines like these, on the other hand—

A cry that shivered to the tingling stars,
And as it were one voice, an agony

Of lamentation, like a wind, that shrills
All night in a waste land, where no one comes,
Or hath come, since the making of the world.—

these give clear and intense revelation; these admit us into the keenest regions of feeling; they are of the supreme essence of poetry, and speak the eternal, genuine language. They should never have been given such strange, unequal yoke-fellows as those last speeches of Arthur and Bedivere.

Neither the soul, nor the demigod, who is the symbol of the soul, ever speculates, or is in doubt, or theorizes. His religion is his career against the demons; he knows no shaper of destiny but his own strong arm. Why should Bedivere pray for him? Whatever eclipse was over him, was wholly expressed in his wound. He *was* "deeply smitten through the helm," and that was the whole share of suffering possible to him, implying all else; to have the mind "clouded with a doubt" is the share of the modern man or personality. Our clouds and doubts are outside of our souls, and inhere in some outward and lesser part of us. The soul, when it passes into its own place, the "Island valley of Avilion," is still serene and majestic and untroubled; and, if anything be known, surely knows that it shall come again to rule and to do battle once more; *Rex quondam, rexque futurus* it is; and imperishable in its sovereignty. KENNETH MORRIS

The Theosophical Society is intended to help men to develop the powers latent in them through their own exertions and merit.—H. P. Blavatsky

"NEXT week I shall be five and thirty years old, and I am only beginning to see what a failure

my life has been. I have never, until now, realized that if I had followed a different course of action at certain times when I had better impulses, I should not now have this feeling of having wasted the years.

"It comes home to me as I see my little daughter growing into girlhood with the same light-hearted temperament as mine, and with the same opportunities for living an enjoyable, irresponsible life, that I had myself. But I wish things might be different in her case. I cannot bear to think of her at thirty-five looking back and feeling as I do."

Many women who have persistently averted their eyes from any ideal of life which interfered with the pleasure and satisfaction of the moment, feel as did the one who spoke these words. Often when their eyes are dwelling lovingly on their young daughters and when they are proudly weighing the chances of the latter for success and happiness, there is an ache at the heart, and a quick sigh, as the something, so close to them at times throughout the years, but always ignored and avoided, quickens at the sight of one so young.

True, the mother cannot be a young girl again in this life, but here is a part of herself, the dearest part, perhaps, and her better nature revolts at the idea of this also being doomed to the waste, dissatisfaction, and disillusionment which have been her experience.

There is a great hope for both mother and daughter if, even now, the awakening desire for a life in accord with the higher impulses be not once more stifled, and the old round followed with such a desperate kind of persistence that openings for escape from it are not perceived. The unselfish yearning of a mother for her daughter's welfare has been very often, and may often again be, the beginning of better things for both. It may be the beginning of an understanding on the part of

A Look Back---and Forward

the mother of the influence of certain amusements, certain environments, in weakening the inclination for a higher life. She may awaken to the need of a more compassionate vigilance in protecting the young life from that which threatens the death of this inclination before it becomes a conscious one. If the yearning grows, and the resources of the womanly na-

Inquirer. But if the Masters exist, why do they not come out before all men and refute once for all the many charges which are made against Madam Blavatsky and the Society. . . . Does not all this injure her reputation?

Theosophist. In what way can such an accusation injure her in reality? Did she ever make money on their presumed existence, or derive benefit or fame therefrom? I answer that she has gained only insults, abuse and calumnies, which would have been very painful had she not learned long ago to remain perfectly indifferent to such false charges. For what does it amount to after all? Why, to an implied compliment, which, if the fools, her accusers, were not carried away by their blind hatred, they would have thought twice before uttering. . . .

Inquirer. But is it not very painful to her to be denounced . . . ?

Theosophist. It might be painful if it were true

The Key to Theosophy

ture are called upon, the mother will learn something of her own being hitherto never called into action. The protective power which mature women might exercise in behalf of young women and girls, demanding as it does, or may—for it is not in general use—the application of the wits and the celerity in arriving at conclusions possessed by women, would reconstitute the conditions of life.

A woman who is alive to dangers misses no warning. But few women are alive to the dangers besetting their daughters and threatening to lead them into just such unwise or worldly ways as they regret having followed.

A loving mother, however, looking back over her own experience, searching for causes,

for small beginnings, eager to find the finger-post that will perhaps suffice to guide a tractable young girl, will realize that it is useless for her to point her daughter away from pleasures and fashionable dissipations which she herself does not unhesitatingly renounce, once she perceives danger lurking there. This is one trouble with mature women—they have a lingering sentimental feeling about anything they have enjoyed, even after they may have glimpsed the fact that they were dulling their higher sensibilities by indulging in it. And if the love for those younger than themselves, and the desire newly awakened for higher possibilities being permitted development, are not stronger than the strain of sentimental retrospection, their wishes for their daughters will lead to nothing.

Women need to dare something in order to give to the world women of a higher type. But it is not departing from the conventionalities of life, or making fierce onslaught upon existing customs that will encourage a higher type of womanhood. It is a courageous and constant substitution of the unselfish, the compassionate, the pure, in thought, word, and deed, for the old easygoing personal, self-gratifying ways, that gradually makes an atmosphere in which the better impulses of young people awaken and grow strong.

It is possible for the mature woman who is in earnest about a higher womanhood, to recreate, to a degree, the material out of which the young people about her are fashioning their ideals. Let her be a believer in life; a believer in the power of her own divinity, and that of others; let her abandon the idea that the best of life has been; let her trust that purity and unselfishness will transform present conditions; and if she be persevering enough to do at five-and-thirty what she did not do in youth, or even to go on trying to do it, for the sake of the young over whom her heart yearns, she can begin the re-adjustment of her own nature upon lines of harmony

with the law of compassion — the only course that ever satisfies the longings of the human heart. Such a woman will have the strength and firmness to desist from ever holding before a younger woman at a time of choice any of the allurements of merely material advantage — how often does the scale turn on thoughtless remarks of this kind! so sensitive, so yielding are the young in many cases to the views acquired by older persons, presumably from the experience which the immature have not lived long enough to have themselves. Again, if the feelings of regret about wasted years be sincere, a woman who learns from retrospection may find within herself the deeper currents of feeling which, unsuspected by herself, are leading her to the broad main onward flow of conscious work with the inspiring purpose of uplifting humanity as a whole.

So subtle, so powerful, is an honest desire to help another, that it may be the key that opens the doors of real life, the heart life. And near an older woman awakened to this true life, how the heart of youth expands!

Do you not remember, some of you who have *not* wasted your lives, the appeal in the looks of such a woman whom you met when you were young? Do you not remember the tones of her voice, and that they struck deep into your own nature, echoing for awhile and then dying away because there was not at hand *another* to sound the same keynote? Perhaps it was years before you met another woman who looked beyond purely personal and transitory matters to the great possibilities not yet realized by women as a class.

Ah! if the regret, the longing expressed in the remarks in the opening paragraph were only transformed into will and action and self-discipline, we should see more mothers the real guardians of their young daughters, vigilant protectors of youth, inspired from day to day by the growing sweetness and true womanliness of the young girls in their charge who are having their souls nourished by pure ideals.

Perhaps the key to the right way of growing old, the key to the mystery of the joys and opportunities of age may still be found by those who, loving another, desire the best for the beloved, and find within themselves the power and knowledge to create conditions better than those which their own environment offered when they were young.

The mothers of Lomaland know this, and, working together, each true to her immediate demands and the heart filled with that higher joy which can only come to those who have learned to work together, impersonally, for a great cause, they become true creators, co-workers under the Law. The sweet pure lives of their daughters, reared as they are in an ideal environment, are as living centers of light, and their own gratitude to those who have made this possible is fathomless. M. T.

How Turkish Women are Lifting the Veil

WITH the dawn of liberty in Turkey a new prospect has been opened up for the women of the whole Mohammedan world. Already many remarkable changes have taken place; for instance, thousands of women are timidly beginning by occasionally lifting the veil which covers their faces when out of doors. There was never a religious obligation to wear it, only a counsel of the Prophet, and so it may be dispensed with under the new conditions; and with the coming of education many ancient prejudices will disappear, never again to return.

Lomaland Photo. and Engraving Dept.

MARGHERITA KRONBERG
A YOUNG SWEDISH ARTIST

The American college for the higher education of Oriental girls has already profited by the new movement in Turkey. The sympathetic attitude of the new government has permitted a great extension of the facilities offered by that institution, and new buildings are to be erected on the heights of Arnaoutkey, on the European shore of the Bosphorus. The present building is at Scutari, the Asiatic suburb of Constantinople. Dr. Mary M. Patrick, the President of the College, who has been connected with it since about 1871 says:

Our college is coming out, now, into a period of prosperity. The Turkish revolution, that statesman-like wonder of modern times in the political world, has given us a legal title to a new site which we purchased last year. . . . You will remember my frequent visits to Washington last year in an at-

tempt to get a legal title. Under the old regime, this was difficult, and might have proved impossible, but with the coming of liberty the whole aspect of the matter was changed. The Young Turkey party is in sympathy with American education and desirous of promoting it, and our title was legalized before the new party had been in power a month.

It is expected that the success of the American College will cause many national educational institutions to be founded by the Turkish Parliament. One is already in prospect, to be built at Foundoukli. The plan is to educate instructresses who will be sent to all parts of the empire. A Turkish lady who is active in the promotion of the new ideas of freedom and education lately told a roomful of American and English women residing in Stamboul, that the teachings of Mohammed have been wrongly construed hitherto, but that now the women have resolved to go forward boldly "giving justice to all as they are commanded." Already they have their own magazines, and among them are many women of letters.

Another striking incident shows the advance of liberal ideas in Turkey. A note was inserted in the reading columns of a Turkish paper in which a Mohammedan thanks his friends "for the many proofs of sympathy received on the occasion of the death of my beloved wife." Such a public reference by any Turkish gentleman to his wife would have called forth universal reprobation until quite lately. Formerly it was not considered polite even to inquire after the health of a Turkish wife.

STUDENT

Jottings and Doings

(From a Student's Note Book)

WHAT has proven to be an ancient Egyptian marriage contract — a manuscript found in a Cairo (Egypt) tomb — has just been deciphered by the Egyptologists of Strasburg University. Says an authority:

The papers contain matter of great importance. They establish the period of an Egyptian Pharaoh and give us documentary evidence of the exalted financial position accorded to married women in Egypt three centuries before Christ, a position almost undreamed of or unhoped for by the most enthusiastic new woman of these modern days. The lost Pharaoh, whose period of reign is established, is Khambasha, and the time is 341 B. C.

From the translation it is shown that in case the wife repudiated the husband, she allowed him to take back half his dower. This is the reverse of modern customs, especially in European countries, where the wife is expected to contribute the dot or dower.

The Egyptian husband not only received nothing from the bride, but had to put up the bonus to make himself the matrimonial possibility. The document shows that in case of a separation he was allowed by the wife to take back but one-third of the moneys they had acquired together during the time they were married.

This is another evidence that Theosophy has not erred in stating that woman's present status, social and legal, even in the most advanced nations, is lower than in ancient days.

AMERICAN, CUBAN AND ENGLISH STUDENTS OF THE RAJA YOGA ACADEMY, POINT LOMA
MEMBERS OF THE WILLIAM Q. JUDGE CLUB

Frederick William MacMonnies

IT is always inspiring to read about anyone who has worked through many difficulties and achieved success in a chosen career. The life of the American sculptor, Frederick William MacMonnies, is an example of this kind of indomitable struggle.

Before he was six years old it was quite clear to those about him that he had great ability as an artist. When pieces of dough were put into his hands to play with, he astonished everyone by modeling them very cleverly into different shapes. Before he was ten he had begun to paint and had actually finished a very good portrait of his father. There could be no question that this boy was to be an artist.

MacMonnies studied at the art schools in New York and then went to Paris. Here, it is said, he did not always have enough money to pay for lodgings, and, nothing daunted, slept in the parks. Later on he got as far as Munich, and when he had drunk his fill of inspiration from the treasures of art in the galleries there, off he set, on foot, for Italy.

When you see his statue of Nathan Hale, in the City Hall Park, New York, or his equestrian statues of the great American generals, or his *Fame*, at West Point, remember his bold struggle to win the success he enjoys,

and also that his great desire is to establish an institution in America that shall offer opportunities for art-study to many more American boy-artists. R. W.

Patriotism as Expressed on the Fourth of July

IF the customs of a nation are an index of its development, the Americans certainly have no reason to be proud of themselves on the Fourth of July. Last year there were 38 people killed and 1429 injured. The fire loss in one city was \$20,000, to say nothing of all the other cities; and each year this history is repeated. Then when one reflects on the enormous amount of money spent for this celebration, the nerves which have been racked, the numerous invalids everywhere who have been made worse—in many instances no doubt, seriously injured—one wonders if a more dignified, a more humane, a more fitting commemoration of that glorious event could not be found by the American people. We are not so uncivilized in reality as this uproarious crazy expression would indicate. If in some savage race we should find each separate hamlet trying to see if it could outdo the others in making discordant, shocking sounds, if we should find the boys trying to frighten and startle the beasts, business sus-

pended and life given up to a racket, we would say, "They are a rude, undeveloped people, and know no better." But when it comes to ourselves—most of the people simply flee from the towns when they can, or protect themselves behind their closed doors, and await patiently or impatiently until the frenzy passes.

This shows what hypnotic force a custom has—once established, it seems to possess an independent life, which it is almost impossible to destroy. It should certainly make us reflect and move slowly in forming new customs.

The Fourth of July commemorates a strenuous time in our history, when noble ideals stirred our fathers to heroic sacrifices and brave deeds. The only meaning in remembering such a time can be to remind ourselves of these things and to try to reach in thought and feeling the height which they did who suffered for us. We need to arouse in our youth the high spiritual feelings which belong to the higher patriotism—and we are content simply to brutalize them.

Anyone who might visit the Raja Yoga school on this day, would find something quite different. The youth are stirred indeed, but by the higher, not the lower qualities. True patriotism is the keynote. STUDENT

THE CHILDREN'S HOUR

West Wind and the Nature Sprite

WEST Wind rose early one morning and went off for a frolic among the tall peaks of the sandy rocks as was his wont. These mountains covered a vast space of country. They were rugged and bare, without a trace of any growing green thing. West Wind loved these rocks; they had been his playground for centuries. As he flew up and down their rough sides, bare and bald as they were, and darted here and there, he knew every spire and crag, or thought he did; but this very morning he made a great discovery. Right at the top of the very highest peak was a rift that he was sure had come in the night while he was asleep in the valley far away. In a second he whipped into the crevice, bent on finding what it meant.

Down, down he flew, singing as he went, until he came to the earth.

Hearing a strange noise, he called out, "I am West Wind—who lives here?"

"Oh West Wind, West Wind, will you move these mountains into the sea? I am a Nature Sprite and have been shut up under these rocks for millions of years, nor can I escape until these mountains are torn down. The King of the Nature Sprites says I should still be bound—just as if he knew! I must get away where I can see the sun and smell the green things. I hate everything here. I hate the earth sprites that can go where they choose; I wish I had them all fastened in a rock and could put the rock into the sea."

"Why, that would be cruel," said West Wind.

"Oh, I am wild, wild and in despair from being bound so long. You will help me, you must; oh say you will."

Now West Wind was of a gentle nature and felt great pity for this imprisoned Nature Sprite; his own life having been always so free, it seemed to him terrible that such bondage should exist. The more he thought about it the more intense became his desire to help; so at last he said, "I have a distant relative who lives a long way from here, Giant West Wind; perhaps he would come and move these mountains into the sea. I will go and ask."

With these words he flew immediately to the home of Giant West Wind and told him the story. Upon hearing it, the old giant determined to release the earth sprite. Knowing it would be impossible to accomplish this alone he sent couriers to his cousin Giant East Wind and to the Earthquake Powers, soliciting aid for the removal of the mountains. They reminded Giant West Wind that they could do nothing until the hour appointed, but that they had been told to be ready soon.

When the time came mighty was the strength put forth by these forces, and the mountains were laid low but were not driven into the

Lomaland Photo. and Engraving Dept.

SWEDISH LOTUS BUDS AMONG THE DAISIES

sea. They were ground into millions of pieces. Alas the poor Nature Sprite was buried as completely as before. West Wind missed the lofty spires and domes that had for ages been his favorite playground, and, as he saw nothing of the Nature Sprite, he came to believe that the destruction of the mountains had been a great mistake.

Ages passed away, and where those rocks had once stood, now was a level plain, a sandy desert upon which no green thing grew for a long, long time. After centuries, West Wind saw one day a prickly plant creeping up. It grew and flourished; then more came until the whole desert was one vast expanse of vigorous prickly plants. They brought a new element to the slowly developing soil.

One day as the West Wind was moving among the thick growth he heard something say, "West Wind, West Wind." At once it reminded him of a voice he had heard ages before, only it was softer now and happier. As he moved about to find whence it came he saw something close by one of the very largest plants.

"Are you the Nature Sprite?" he asked in his soft singing voice.

"Yes, West Wind. Shall I tell you how I came here? When that terrible crash of falling rocks came, I was driven farther than before into the earth. In the days following, in fear and trembling, I remembered how cruelly I had treated many nature sprites when I

was their queen; how at last because of my hard, wicked nature, and because I considered no one but myself, I was left all alone. The King said I could not rise until my heart was changed. After many years of suffering I saw the justice of it all, and I learned to love instead of to hate. Then I went to a long, happy rest. When I awoke I found myself close to the top of the earth. It was not hard to rise into the light and sun. I am now trying to help, if only in a small way, so I sit by these prickly things that all creatures shun. They know I love them. I smell the flowers and green trees far away. I should like to go where they are, but I still wait. They do not need me; I will stay by these plants; they are passed by without notice by most living things. They feel that I mean to be kind and helpful."

The next year, at the end of a hot summer a great fire came and swept over the plain. The Nature Sprite went down into the earth and escaped harm, but every plant, root, branch and seed, was destroyed. When West Wind saw what had happened he whisked rapidly away to a far off country where grew beautiful flowers. Gathering many of their seeds he hastened back, scattered them over the plain where the way had now been prepared for them to grow. The next season, behold a transformation! The desert no longer desert but

a scene of beauty. Flowers of rich coloring were there, and there too lived the Nature Sprite with others of her kind; and she was loving and beloved, and her happiness could not be measured. L. H. H.

The First of May in Sweden

THE snow has melted and spring has come to Sweden. All nature is awakening to a new life. The brooks come rushing down the hillsides, singing and dancing, and here and there little spring flowers begin to peep forth. The larks, thrushes, and starlings have returned and are now so busy building their nests. There is twitter and singing in every bush, in every tree. What is it they sing? "Twirrewit, twirrewit! Spring is here! Spring is here!"

It is the first of May and young and old are hurrying out to welcome spring. There come long trains of school-children and college-students with clear voices singing their welcome to spring.

As the sunbeams are dancing along the streets of the little town, or the avenues and parks of the large cities, they fall on a little yellow flower, "Ranunculus," which everyone is wearing this May-day. They are not real, living flowers, but are made of celluloid, and are bought to help poor suffering children to spend the summer among flowers and sunlight and open fields instead of in their dark homes in the large cities. A "Bug Theory" of the Universe
THE daily records of current science afford us ample illustration of the remarkable way in which certain prophecies of H. P. Blavatsky's concerning science are being fulfilled. She said that chemistry and physiology were the twin magicians of the future, destined to open the eyes of mankind to the great physical truths; and that science would be compelled by the facts to turn from its mechanical theories towards the teachings of Occultism. That it is doing so with rapid strides, the progress of discovery and speculation amply proves.

That the whole of nature is actuated by "lives," and that there can be no such things as blind forces or dead matter, was one of the principal teachings she set forth as being those of Occultism. The science of the 19th century, in which century she wrote, was pre-eminently one of atomo-mechanical theories; whereby, through a singular perversion of the reasoning faculties, it was sought to provide a reasonable explanation of the universe on the theory that all is composed and actuated by the action of unconscious "forces" upon dead "atoms."

Now it is being realized that this view is not only unthinkable but is not supported by the facts; and once more, as of old, science is offering to our view a universe teeming with life and conscious purpose in every point. In the revised theories of chemical action now gaining ground [see p. 12 of this Review.—Ed.] it is pointed out that chemists have discovered that many reactions will not take place without the aid of certain electrical agencies, vaguely spoken of as "electrons" and connected in some way with the presence of water. Thus perfectly dry hydrogen and oxygen can be heated to redness together without exploding, and phosphorus can be distilled in an atmosphere of perfectly dry oxygen. The conclusion reached by the chemists was that electrical action is an essential in chemical combination. This flatly contradicts the older theory that the atoms themselves possessed an "affinity" which alone was sufficient to make them interact. In place of this old idea of the inert atoms falling together (so to speak), we have now the idea that their interaction is brought about by agencies which are neither forces nor matter — for the electrons do not answer to either description — and which may therefore reasonably be called "physical lives."

In botany, too, it has been found that the nutrition of certain plants is effected by means

of "bacteria" in the roots; another instance of the intervention of living beings in the production of results once attributed to non-living agencies. In physiology the view is daily gaining ground that our body is composed of little beings instead of dead atoms; while a large part of the domain of chemistry has been taken away from the domain of chemical and physical forces and put into that of micro-organisms; bacteria, or ferments, in fact, are recognized as being the prime movers in a host of actions.

From this position it will not be many steps to the admission of the entire Occult teaching — that all nature, the so-called inanimate as well as the animate — is actuated by living beings. The statement which gives the immediate occasion for these remarks is as follows:

1. Malaria can be, and is, conveyed from sick to healthy persons by the agency of mosquitos;
2. Malarial infection is not known to take place by any other method.

This is the result of certain experiments carried on in this connexion. It shows again that the presence of the living being is essential before anything can be done.

We seem to be getting to what might be called a "Bug Theory" of the Universe. Everywhere we find the bug. He brews our beer and raises our bread; he grows our peas and fertilizes our soil; and now it seems we cannot even catch a disease without him; and if we propose to kill this disease, we must employ the services of another bug. In chemistry he reappears as a kind of mineral bug, now called an electron instead of a bacterium. Last century we had the atomic theory; now we have the bug theory.

Thus we have gotten part way back to ancient science; but still our materialism makes us pay too much attention to the mere bodies of these little "lives"; and where ancient science spoke of nature-spirits and gods, we speak of bacteria. What we call a germ or microbe the ancients would have called a *daimon* or spirit — good or bad. They looked rather to the higher aspect of the process, as we shall come to do later on. The mosquito is a mediate cause in infection; but he is himself only an agent. To the eye of our science, the house-fly and the mosquito and the smaller organisms are merely little bodies; we have not investigated the causes which give them birth and wing them on their destructive way. But that they are connected with evil influences that emanate from the perverse disposition and unclean thoughts and acts of man

himself is another teaching of Occultism which will one day be admitted. A destructive swarm of insects is the embodiment of—what?

A destructive force; for true Science recognizes a law of "conservation of energy" in all departments, not merely in the physical world. On one side of the account is the destructive

**Human
Responsibility
Inevitable**

effect; on the other side, to balance it, must be the destructive cause. Nature does not act from sheer "cussedness," nor can we suppose that the One-All or the Absolute or the Eternal-Fitness-of-Things interests itself directly in hatching out a swarm of malarial mosquitos.

Mind and Will are the universal agents; their synthesis forms life and living beings; and science has failed to analyse even physical matter into anything else.

Science teaches us that the living as well as the dead organisms of both man and animal are swarming with bacteria of a hundred various kinds; that from without we are threatened with the invasion of microbes with every breath we draw, and from within by leucomaines, aerobes, anaerobes, and what not. But Science never yet went so far as to assert with the occult doctrine that our bodies, as well as those of animals, plants, and stones, are themselves altogether built up of such beings; which, except larger species, no microscope can detect. So far, as regards the purely animal and material portion of man, Science is on its way to discoveries that will go far

towards corroborating this theory. Chemistry and physiology are the two great magicians of the future, who are destined to open the eyes of mankind to the great physical truths. With every day, the identity between the animal and phys-

**The Secret
Doctrine**

ical man, between the plant and man, and even between the reptile and its nest, the rock and man—is more and more clearly shown. . . . The same infinitesimal *invisible lives* compose the atoms of the bodies of the mountain and the daisy, of man and the ant, of the elephant, and of the tree which shelters him from the sun. Each particle—whether you call it organic or inorganic—is a life.—*The Secret Doctrine*, vol. I, pp. 260, 261 (published 1888)

STUDENT

The Devil and Passive Contentment

Happy the man whose wish and care
A few paternal acres bound,
Content to breathe his native air
In his own ground.

Whose herds with milk, whose fields with bread,
Whose flocks supply him with attire;
Whose trees in summer yield him shade,
In winter, fire.

Blest, who can unconcern'dly find
Hours, days, and years, slide soft away
In health of body, peace of mind,
Quiet by day.

Sound sleep by night; study and ease
Together mixed; sweet recreation,
And innocence, which most does please
With meditation.

Thus let me live, unseen, unknown;
Thus unlamented let me die;
Steal from the world, and not a stone
Tell where I lie.

—Alexander Pope

THE above picture, however excellent, represents but a phase of human life.

Desirable as such a condition may be after seasons of war and turmoil, it cannot last. Man's destiny is not to drowse away his time in indolent contentment; his goal is something higher. Implanted in his breast is something that forbids him to stagnate like an ox. This mysterious "something" is what makes man "Man" and distinguishes him from the beasts. Always, so long as he has

this, and remains Man, he will be stirring, fighting, aspiring with a divine discontent.

It is this Something that is the cause of human progress. It is this that the powers hostile to human progress have attempted to kill out or narcotize. Always we find the Great Conspiracy to induce Man to resign this Something and to yield up his heart, head, and hands to some Power. To lure Man to assume an attitude of resignation and self-abandoned adoration, and then step in and take possession of the vacated throne—that has been the Plan.

In pursuance of this Plan, religious teachings have been ingeniously perverted so as to seem to teach that Man does not possess this mysterious Something. But, as its existence could not be altogether denied in face of the facts, it has been turned into an *evil* power and dubbed "Satan." And the attempt has been made to prove that all its promptings are evil and to be eschewed. Thus has Man, under pretence of saving him from sin, been lured into abrogating his own immortal God-given Spirit of progress; into regarding the attainment of knowledge as evil, and into throwing himself on the mercy of theocracies. At this very day is this Scheme being carried out by those who, in the name of religion, and under the assumption of the highest prerogatives, are formally denouncing all science, discovery, and liberty of thought. Nor is it being done openly alone; for secretly and subtly the same influence is working in our civilized lands, actually using our vaunted "Liberty" as an engine for furthering its own fell purposes of mental enslavement.

Theosophy calls upon man to recognize his own Divinity and throw off the yoke of fear and superstition that these powers are striving to bind on him. It does not invite man to yield to his passions and caprices; evil passions are the result of a perversion of the higher powers in man; and it is the above-mentioned maleficent teachings that are responsible for this perversion. For, if the liberty and free will of man is shut out from all activity and expression on the higher planes, it will vent itself on the lower. Thus it is that we find these enslaving dogmatic teachings always go hand in hand with intemperance and other forms of self-abuse; nor is it without significance in this connexion that ecclesiastical organizations should so often show themselves champions of the liquor interests.

What Theosophy urges is that man should recognize his divine free will and use it in accordance with the eternal laws of Right. Let him be a warrior in a good cause. We must make up our minds to fight, for we cannot have indolent contentment so long as there are enemies at our door. And the nature of man is an enemy unless it is controlled and directed by Wisdom and the Will. It will continually worry him, and he must either conquer it or be conquered by it.

The main cause of the power and predominance of evil natures is to be found in the passivity and inertness of the well-meaning natures. These latter think that mere refraining from doing active wrong themselves is sufficient; their duties, they think, do not extend to preventing other people from doing wrong. Thus we find all the activity and positiveness and executive power on the side of the evil, and the good are negative and in-

active. We see it on the small scale in our daily lives; one bad individual, perhaps, leading a whole group of well-intentioned by the nose, because he is the only one that has any "go" in him; it is doubtful, after all, if he is not the best of the lot; for the man active in evil may be converted, but the indolent can never do anything. Such people may be on the wrong track; but the Good Law has at least turned them to good account by placing them near us to goad us into doing something.

The attitude of mind of people who sit still and complain of the rampancy of evils which they never lift a finger to redress is something amazing in its fatuity and sublimely unconscious hypocrisy. It reminds one of a feeble master in a school, who lets the boys do what they like, while he mildly expostulates; when he could make things far pleasanter for all concerned if he would only wake up and get on the top of the situation, where he ought to be.

The evil in us is merely a lot of children broken loose, because we let them. It is waiting to be controlled, inviting us to control it, and we will not. The churches have told us that this evil is the Devil, and that we must pray to Jesus or the Virgin;—not forgetting the contribution to the humble agents of those celestial powers, who *must* live (?). They have invited us to abandon the fight and leave it all to Jesus. No wonder the abject performances of many of the early "Christians" moved the righteous wrath of some "Pagans" who had retained something of the spirit of dignity and self-respect that belongs to a Man. But Paganism would not have succumbed to this emasculating influence that broke over the world, if it had not itself given way to unbridled license and profaned its sacred Mysteries by debauchery.

Theosophy, then, calls upon man to rouse himself from his indolence and *be something*. Passive contentment may be all very well, but it can not be had when times are moving. There is a great deal too much amiable indolence and well-meaning that stops short at meaning and never gets any farther. The world needs strong men and women. E.

Continuous Matter?

IT was found by M. Faye that the volume of Donati's comet (1858) was 500 times that of the sun, while the comet's mass was but a fraction of that of the earth. Thus the material of the comet must have been more rarefied than the most perfect vacuum obtainable by an air-pump. Moreover the stars were seen through it with undimmed brilliancy, although the tail of the comet was many thousands of miles in thickness. Facts like these appear to suggest that there may be an order of matter which is non-atomic. Indeed this should surely be a fundamental idea, for it is just as thinkable, or unthinkable, as *actio in distans*. The latter implies a continuous medium of some kind, nor can this conclusion be avoided. This continuous substance is itself but the outer garment of that which responds to creative thought, and upon these *noumenoi*, impressed by conscious intelligences, is built the physical universe. The mysteries of gravitation, "telepathy," and "second-sight," imply the existence of some subtle continuous substance—real, but beyond microscopic ken.

Some Views on XXth Century Problems

Mental Rents

ONE of the London theaters is issuing a leaflet in advertisement of the performances of a dancer. She dances only when hypnotized, and her gift was accidentally discovered during a course of that treatment for headaches. After its discovery she betook herself to the stage, being thrown into the hypnotic state before every performance. The reality of the state is vouched for by a number of savants, one of whom has taken the opportunity to write a book with this case as its text. Says the leaflet:

Prof. Magnin's studies of Mdle. Magdeleine have been confirmed by such eminent savants as Professor Richet, of the High School of Medicine, Paris; François Frank, Professor of the College of France; Flournoi, Professor of the University of Geneva; Lipps, Limerfeld, both Professors of Munich; Benedict in Vienne; Max Desois; and Moll of Berlin.

All danger that the conscience of the public might be pricked is allayed by the final paragraph:

For the benefit of those unacquainted with the science of hypnotism it may be mentioned that no harmful effects whatever occur to the medium and the tests given are entirely free from pain.

The man in the street, certainly "unacquainted with the science of hypnotism," will not guess that the professors are nearly as unacquainted with it as he. So he will accept the confident statement of its harmlessness.

Suppose that instead of being overawed by important names he does a little thinking for himself. He wants a confidential clerk in his business, one upon whose judgment and secrecy he may absolutely rely. Of several applicants he selects one, and then inquires into his past. He finds out that from time to time this man falls into a state, lasting perhaps an hour or two, in which he becomes entirely devoid of initiative. During this period he accepts every suggestion made to him, acting, thinking, and feeling, exactly as he is told. He will also, at command, tell everything he knows; and, at command, invent and narrate anything whatever of himself or anyone else. He can also be successfully ordered to act, speak, think and feel in any desired way at any desired time *after* his normal consciousness has been resumed, and then without memory of the order; the act of thought appearing to him as his own.

What chance would that candidate have? He pleads that the state, though frequent, does not come on of itself, that it was induced by the hypnotic manipulations of the great Professor Snooks. (For the state we have described is the hypnotic state.)

"It won't do, my friend. I am sorry for you, but I can't have you in my business. You are a horse that has been down. How do I know that you may not at some time *fall* into a state into which you have allowed yourself to be *put*? The fall might be so partial as to be unnoticeable and yet be enough to blunt your judgment and make you do or say some very indiscreet thing. How do I know what suggestions were made to you in your last trance, latent as yet and awaiting

their hour? How do I know what suggestions were made to you by others than the operator, after you had left his hands but were still in that negative state which, I understand, follows the séance and persists for a day or two? How do I know what *unspoken* suggestions were made to you, either intentionally or from someone's subconsciousness? Your procedure now should be *to heal the rent in your mental envelope* which you have permitted to be made, and that will take time. Till then your manhood is incomplete; you are even something of a 'case.'"

STUDENT

Building the Next Body

A CUTE diet questions alter their form a little for those who believe in Reincarnation. How much of your present diet can you carry over to your next birth? Suppose it were demonstrated that the eating of apples had a tendency to enrich and clarify the blood. You go in for apples accordingly, and get the enrichment and clarification. But as this fruit is pleasant to you, you knowingly eat too much of it. Moreover the vigor you get from it enables you to give way, with a safety not hitherto enjoyed, to the attractions of all other foods. But this notwithstanding, health is gained and you pass to a green old age, finally leaving your benediction upon all apple trees the world over.

There is a kind of health which is transposable from one birth to another; and there is a kind which is not. The kind which is not is due to *what* you eat; the kind which is, is due to *how* you eat. The man whose diet were ambrosia, but who "lay under his stomach" while he ate it, might develop a healthier body than he who could get nothing better than pork and beans. But if the latter kept his will alive at every meal and never lost his self-restraint, he would be getting, through possible present ill-health, future good health. He is accumulating that inner health—of mind and will—which will hereafter manifest as outer health. The right diet is important; the right way of dealing with *any* diet, right or wrong, is more important.

There is more in the question of restraint in diet, and of rightness in diet, than will culture or health culture, though of course both are involved. There is more in life than *length* of days; *fulness* of days must be considered, fullness with consciousness. A quality or quantity of a meal which dims the mind and feeling for the part of the day which intervenes between it and the next, is a robbery of life, of the soul. We need the clearest consciousness the body can afford. What a man is, at death, what he passes on with, as his eternal possession, is the resultant of all the states of consciousness of his closed life. By excesses in diet it is possible—perhaps usual—to blur these in millions, as it were to *half* fill them with experience-content. To find that right diet, in quality and quantity, which will keep consciousness clearest, is one of the great duties of life. Contrast two men of whom one has blurred the consciousness of five successive lives and the other kept it

at its maximum of clarity—and then consider whether the evolution of genius is so inexplicable a phenomenon? There are of course other elements in the problem than diet, but the example we have suggested will bear a good deal of thinking out. If we are to eat to live, let us eat to live the next life as well as this one.

STUDENT

The Theologic Tangle

A COUNTRY Methodist sends to an English religious paper "a report of the examination in quarterly meeting of a candidate for the local preachers' Plan—an ordeal in which the examinee is cross-examined by the minister and the veteran 'locals' on the Plan." The extract, says the journal, may afford "a glimpse of the working theology in the making of a member of a class of laymen who 'supply' thousands of pulpits every Sunday." This "theology" is therefore still alive and "working" among great masses of people—because they know no other. Here is a part of the examination:

Supt. Minister. What reason have we to believe in the Divinity of Christ?

Answer. By putting away sin for us by His death He has done what He could not have done if He had not been Divine.

Supt. Minister. What do you mean by Justification?

Answer. God regards the sinner who believes Christ as if he had not sinned; pleading the merit of Christ he is justified before God.

Supt. Minister. What is Christ doing now?

Answer. He is interceding for us.

Supt. Minister. Have you read John Wesley's sermon? I strongly recommend you to do so.

Lay Member of the Meeting. In reference to "Christ putting away sin." Will you explain how He does that?

Answer. By the shedding of His blood He has made atonement, whereby sin may be cancelled, and put behind God's back for ever.

By the same Member. Don't you think Christ is occupied in interceding with men rather than with God?

Answer. That is the work of the Third Person in the Trinity.

Of the three Persons in the Trinity we thus learn that the second is occupied in interceding with the first; and that the third is interceding with *us* to induce us to believe in the intercession of the second with the offended first! Yet "there is one Person of the Father, another of the Son, and another of the Holy Ghost . . . and yet they are not three Gods: but one God."

And the people, some at any rate of whom yearn to know the eternal ways, are furnished with this! The real Trinity, tri-unity, of the old creeds and philosophies (the soul of man and of the universe in their aspects as divine thought, as divine feeling, and as that absolute essence of which thought and feeling are woven) passed into the brain of Athanasius and became the three "incomprehensibles" whose inter-relation the people must learn and the preachers preach: "which except a man believe faithfully, he cannot be saved." And the people tried. STUDENT

A New Serpent Mound

THE *Ohio Archaeological and Historical Quarterly* reprints an article from *Records of the Past*, on a new serpent-mound in Ohio. In that article Professor James Fergusson, author of *Tree and Serpent Worship*, was quoted. He throws doubts on the idea that the great serpent-mound in Adams County was intended for a serpent; but doubts were entirely removed by Professor Putnam's investigations in 1885, when he explored the whole mound and restored it. And now another mound has been discovered, also a serpent-mound, and equal in dimensions to the older one.

This new mound is in Warren County, in the valley of the Little Miami River, where it stands upon a terrace of glacial gravel through which the river has carved a deep channel. The head of the serpent has been washed away, but the neck and body can be traced in a mound about 3 feet high and from 10 to 15 wide, for about 500 feet, after which there are convolutions and curves extending indefinitely.

Professor Fergusson said of the mounds that—

If it should turn out that these are really representations of the great serpent, and that this worship is indigenous in the New World, we are thrown back on the doctrine that human nature is alike everywhere and that man in like circumstances and with like degree of civilization does always the same things and elaborates the same beliefs.

Very mixed logic. In the first place, if the mounds are really serpents, it does not follow (as implied by Fergusson) that serpent-worship is indigenous to America. The archaeologist must have already made up his mind that such worship could not have been imported; on this assumption his logic holds good, but not otherwise. Next, if serpent-worship is indigenous to America, it only follows that the Americans elaborated the same belief as people in the Old World, not that man everywhere and always does it. The archaeologist is too sweeping in his conclusions.

But we know now that serpent-worship—or, rather, the veneration of the serpent-symbol—was observed by the Atlantean ancestors of the races in both hemispheres, and by them transmitted to their descendants, who modified it more or less in accordance with local zoology and other circumstances.

The article quoted says:

The significance of the existence of this second serpent mound of such enormous size can hardly be over-estimated. Beyond all question these effigies are symbolical. They are the embodiment of ideas which moved this prehistoric population to gigantic combined effort at expression. They serve closely to ally the mound builders of the Mississippi Valley with the almost universal body of nations and peoples who have feared and propitiated or adored and worshiped the form of the serpent through all time. They at once start anew the question whether this reverence for the serpent has spontaneously and independently arisen among nations from a common

Lomaland Photo. and Engraving Dept.

QUAINT COSTUME, AND STAIR, BARMOUTH, WALES

impression made upon the senses by its appearance and behavior, or whether serpent-worship is derivative, thus indicating a common origin of the human race.

Curiously enough, the serpent has been about equally feared and adored; the symbol of the serpent has stood to represent both evil and good.

He then gives instances of the use of the symbol, as H. P. Blavatsky does in *The Secret Doctrine*, mentioning Moses' brazen serpent for healing, Aesculapius, Apollo and the Python, Kneph, and Typhon the Nāgas of India, and the Narguals of Mexico, etc. He rejects the theory that all mankind hit upon this idea independently, through their admiration for the marvelous properties of serpents; and prefers the theory that the worship arose among Turanian peoples and by them was carried across Behring Strait.

It is indeed a far-fetched theory that races whom we presuppose to be uncultivated barbarians should possess such a tremendous power of observation and imagery, out of all keeping with their usual manifestations of intelligence; and still more incredible that they should all arrive independently at the same results. Theosophists cannot swallow such a theory. The other theory is more reasonable, but much hampered by limitations in the knowledge of the history of races. It is absurd, too, to suppose that any awe of the actual reptile gave rise to such universal veneration;

as absurd as to suppose that the Cross was worshiped on account of people finding it in nature and being impressed by it; or that the Lamb of God, or any other symbol so arose.

Students of the Secret Doctrine are familiar with the serpent-symbol, with its dual meaning as both good and evil, and how it stands for the informing Spirit in Man, or man's free will and intelligence, both as the enlightening *Buddhi* or Wisdom and as the tempting, deceiving *Astral Light*. The ancient races who venerated this symbol were students of the Wisdom-Religion and set up their serpents as emblems of the Divine in man, just as we set up everywhere our Cross-without-a-Circle as an emblem of our materialistic faith.

STUDENT

The Hittites

THE mysterious "Hittites" were demonstrated by the archaeologist Winkler to have been, at about 1500 B. C., on an equal footing with Babylon and Egypt, as one of the three great powers then ruling in that part of the world. Professor Garstang, who led the expedition from the University of Liverpool (England), found at Sakji-Geuzi, in one of the many mounds there, a temple in an excellent state of preservation; and, although this was in Hittite times only a provincial city, the sculptures compared favorably with even the best Egyptian reliefs. The explorer, after probing some of the numerous other mounds, concluded that they would repay excavation, and looks forward to ten or fifteen years' work. The Hittite characters are yet to be deciphered, and it is hoped that bilingual inscriptions may be found.

Archaeologists are as yet extremely mixed up about the empires of ancient Asia Minor, Syria and the neighborhood. There are the "Phrygians," that great people spoken of by the Greeks. They seem to have occupied Asia Minor, and the Liverpool expedition investigated their country, adopting the hypothesis that they were a branch of the Hittites which had spread from the region between the Orontes and the Euphrates. It seems very doubtful whether the Hittites mentioned in the Bible were the same as the Khita with whom Ramesses fought. The Bible writers appeared to have used this name rather loosely and applied it to some Semitic tribe or tribes which they encountered. There is still very much to be learned about the ancient civilizations of these regions; and, as discovery succeeds discovery, science will be compelled, however reluctantly, to admit the teachings of *The Secret Doctrine* as to the antiquity of civilization and the existence of the great prehistoric Atlanto-Aryan culture which gave rise to the mysterious empires they are exploring. Scientists have too many dogmas about the origin and development of humanity, and facts are continually contradicting these.

✻ The Trend of Twentieth Century Science ✻

The Heat of Plants

IN some experiments which he designed to show the respiratory activity of plants, reported in *Umschau*, Professor Molisch seems to have undesignedly shown something else altogether, and left that something else unnoticed.

There is a rise of temperature in piles of dead vegetation. But the vegetation being dead, the heat is not due to its respiration. It is, however, due to oxidation; but in this case the oxidation is being caused by the bacteria of decay. And it may be so rapid that if the air cannot get into the pile and carry away the heat, actual flame may break out.

Respiration is oxidation of living tissue, its slow and of course flameless burning, effected under its own careful supervision. Plants breathe, as well as animals. Heat results; but is the heat of a plant, which is somewhat higher than that of the surrounding air, entirely due to respiration? Or does some process normally go on in plant tissue which we do not understand, likewise productive of heat? Professor Molisch's experiments suggest that there is such a process.

When a mass of leaves is packed together so closely that air cannot carry away the heat, the temperature steadily rises, at last to such a point—in the case of pear leaves, to 138°F.—that the leaves are killed. Then the temperature falls, in a little while rising again. The first rise is due to the internal activity of the leaf cells, an activity which Professor Molisch seems to think is respiration. The second rise is the work of the bacteria of decay. He took seven pounds of the leaves of the hornbeam, packed them in a basket, packed the basket in wood wool, put this into a box, and wrapped the box with cloths. Then the temperature rose from 73°F., which was that of the room, to 111°F., and finally to 125. This was the fatal temperature for those particular leaves. (Various kinds of leaves have each their own fatal temperature). Being dead they ceased to produce any more heat; their temperature fell, to rise again shortly from bacterial action.

Was this heat due to respiration? Surely the basket, the wool, the box, and the cloths were sufficient for the practical exclusion of oxygen. All that could have been present was that small amount included between the leaves when they were packed. The heat must have been mostly due to some other activity than normal respiration. There are two possibilities. Either the life of the cells includes some heat-producing activity which is not oxidation and of which we know nothing; or the cells, unable to breathe and beginning to die, become subject to some process of degeneration which involves the liberation of heat. This process is not in immediate connexion with death, for if the leaves are taken out before the fatal temperature is reached, and put in water, they show that they are alive. There is clearly a point in plant physiology which is worth investigating. We want to know whether we are dealing with a normal phenomenon or a morbid one due to the confinement. STUDENT

Sea-Water as Medicine

THE zoological theory that all the life of the planet took origin ages ago in the sea, that sea-water, if not the mother, was at any rate the wet-nurse of primordial life, has received a medical application. What was good for us once must be good for us now. Sea-water and blood serum are still very similar, chemically; everything that the latter contains is also in solution in the former, and in nearly the same proportions; though the former has some other things, for example gold, and probably every other metal. These, however, in sea-water doses, may be good for us.

Sea-water, then, is a saline medicine or food, and is being so used both for infants and adults, with great success in a wide and widening range of troubles. In accordance with the current fad it is thrown beneath the skin with a syringe, but there seems to be no reason why it should not be just as effective by the mouth. To reduce its salinity to that of blood serum, 83 parts of it are diluted with 190 parts of spring water. To avoid sewage contamination it is taken a long way out from the coast, and, to avoid surface bacteria, at a depth of 30 or 40 feet.

The benefit is not a mere question of saline feeding; it follows from an element in the water which chemistry has not detected. For it is not obtained in the same degree from an artificial imitation of sea-water; nor from sea-water which has been boiled or sterilized; nor from water which has been kept a number of weeks. Radio-activity of some kind may be the beneficial work. The dose of the dilution is from one-third of an ounce up to two ounces; it is filtered through a germ-proof filter, kept in sterile bottles and given with precautions as to asepticity. STUDENT

The Doomed Teeth

DENTISTS seem to be pretty generally admitting that teeth decay faster and earlier than they used to, and there are many speculations as to the cause of the change. Its discovery is important, for decaying teeth means chronic poisoning, and absent teeth dyspepsia, both further meaning bad health and small efficiency.

The radical cause, according to general opinion, is the softness and moisture of the foods we now prefer to eat. The teeth do not get the pulling and pressure which is their form of exercise. A raw apple or whole-meal bread does them good; a baked apple or fine white bread gives them little or nothing to do.

It seems to be true that—leaving children out of count, of whom, because we know better how to treat them, more survive—the average life-length shows a tendency to shorten. Tuberculosis tends to increase, though, because we know better how to treat it, its deathrate will get shorter.

In other words vitality is lowering and therefore pre-natal development is less perfect. The living body of the tooth is covered with a protective shell of flint, enamel. Decay can only begin at some point where this is defect-

ive. This shell is never renewed; once worn away, the loss is final. May it not be that the increasing decay is due to an increasing number of teeth from the first imperfectly shelled with enamel, whose enamel exhibits microscopic flaws? However microscopic, the slightest flaw is a wide open door to bacteria; and the decay of the underlying living dentine is a bacterial process.

If this is not the explanation, how come the increasing number of cases of early decay? The lack of exercise might cause the teeth to suffer the changes of old age a few years sooner than normally; it cannot account for those foci of early decay which depend upon absence of enamel. It is these which must be becoming more numerous; and these depend upon developmental causes. The same causes are at work upon the eyes, with the same results. STUDENT

Dyeing

WHAT happens when a fabric is dyed? What is the relation between the thread and the color? A contributor to a chemical contemporary discusses the three current theories, finally deciding for the last.

Is the union *chemical*? Does the cellulose or fiber of the fabric enter into chemical combination with the dye? Cellulose cannot exhibit strong acid or basic properties, and has never been proved capable of such a combination as the theory requires. Moreover chemical experimental work purporting to settle the point has mostly missed it altogether, devoting itself to *animal* fibers, silk and wool.

Does the dye *dissolve* in the fabric, somewhat as one metal will dissolve in another? "Witt drew attention to the fact that wool dyed with magenta was of the same color as a water solution of magenta, and not the dark green color of the magenta crystals." Somebody else, however showed that if the crystals are small enough they are of the same color as the solution. For this and other reasons the solution theory has been given up.

There remains the *mechanical* combination; the particles of the dye, in very minute subdivision, are included in some special way among the fibrils of the thread. Dye stuffs could hardly be supposed capable of entering into solution in, or chemical combination with, charcoal or China clay; yet both these substances will absorb dye from water like cellulose, becoming genuinely fast dyed—though in the case of the charcoal the color is of course invisible. In these cases, and in the case of dyed fabric, what holds the discrete dye particle "fast" to the neighboring fabric particles?

It is found that fabrics absorb dye-stuff from water—that is, solid from liquid matter—at about the same rate as they absorb moisture from the air—that is, liquid from gaseous matter. The curves of absorption correspond for the two cases. The latter process depends on the little known law of "surface attraction," and it is assumed that the former does too. Thus far our knowledge. STUDENT

Nature

Studies

Climates and Atmospheres

ONCE there was a fair field with green grass and wild flowers over the hillside and down to the brook that wound its way to the sparkling waters of the bay. The sunshine and the cool air from the mountains made a delightful climate where nature blossomed with flowers and ripened with fruits and thrilled with bird-notes, and peace and beauty pervaded all. The earth drank the rain, and the moisture found its way down to the roots and transformed the dry clod into living stalk and leaf and bud. The birds ate the fruit and seeds and gained strength and sweetness for soaring wing and joyous song. The green things felt the grateful sunshine and grew more beautiful because of the music of the birds. Everything was simple and natural.

Then a man drove by, looking for a place to build on, and straightway chose this charming spot. He planned the walls of his house to enclose so many square feet of nature's kingdom and he had wide windows to give him the larger view, and doors through which to come and go, and a chimney arose from his hearth. The birds perched on the new framework at sunrise and peered curiously at the strange sort of tree growing in their midst; but when the workmen came the noise of the hammers drove them away.

It seemed at first that the place was so full of song and sunshine that to build there must mean to enclose just so much of the beauty and gladness for a home atmosphere. But the family somehow seemed to bring their own feeling with them. The birds that tripped daintily across the veranda to peer in at the breakfast table failed to see the bright eyes of birdland, and instead of thrilling song-notes heard the people talking in critical, gossipy, frivolous tones about what had happened and what was going to happen, and no one was enjoying the glorious morning air and the fragrance. After breakfast the man took some medicine for his stomach trouble and sat on the veranda to smoke with a friend. They viewed the panorama spread before them and prophesied the high prices it would bring if boomed for real estate. From this they drifted into a discussion of stocks, and unmindful of the freshness and peace around them their minds were busy in the thick-aired noisy pit of the city board of trade.

Much time and trouble were spent in getting up the meals, but yet the people were unsatisfied with the food. Much time was spent in getting new clothes in which to drive about, yet they never seemed to reach the place where they wanted to be. Nature poured the fresh air and fragrance into their windows, and the notes of many birds; but the inside of the house had an air of its own; an unsettled restless life seemed to be going on amid a

Lomaland Photo. and Engraving Dept.

NENEHAM COURTNEY

world of busy, happy contentment and peace.

At last the family, who had thought this a most healthy and desirable place to live in, decided that the climate did not agree with them; they said they were very susceptible to climates and had had a large experience trying to find the right one. So they packed their trunks and went away, leaving only the poor caretaker and her crippled son, who stayed in a tiny lodge at the gate. These two rose at sunrise and spent the day in simple tasks, eating of frugal food and passing the long dewy nights in refreshing slumber. As they watched the green things grow and heard the birds sing, and breathed the fragrant air, they smiled into each other's eyes and said surely no one had ever lived in such a paradise as they enjoyed.

L. R.

Reckless Waste of Artesian Water

NO one with a proper sense of economy would leave an artesian well to go on spouting to waste for indefinite years; the wicked profligacy of the thing would appal him. Yet this has often been done, and now experts are pointing out that though Nature's bounty may last for years, it will not last for ever; and these years are probably mere minutes as compared with the lapse of time which Nature will demand ere she consents to renew the supply.

The ease with which water is obtained by drilling in many places along the east coast of Florida led people to dig deep wells and neglect them. In many places where the flow has

not been shut off, the head of water has diminished, especially where many are in the same locality. In Indiana, where water flowing out between the casings of hundreds of abandoned gas wells has been allowed to waste for years, many of these wells have ceased to flow. In California and elsewhere farming districts once made fertile by irrigation from flowing wells have now become desolate through their reckless misuse. Owners are therefore directed to cap their wells or otherwise shut them off when not in use.

What hypocrisy it is to prate about the bounty of the Almighty and offer him prayers for sustenance, when we treat "his gifts" in this fashion! Surely such profligacy is neither religion nor science; and it were well to propitiate the one or the other. Man should make up his mind what he wants to be; whether a responsible being, dispensing Divine powers; or a humble protégé of Nature, like the animals. He cannot be both; he cannot claim superiority when it is a question of privileges, and shirk it when duties are in question. The fact is that we have presumed to flaunt our independence in the face of Deity and have been set loose from our leading-strings according to request. Then we go forthwith and put our hands in the jam and turn on all the taps. Then back we go to Deity with our tears and reproaches. The lesson to be learned is that whatever Deity we worship — Jehovah, Jesus, Science, Man, Nature — we must do our part and in return for benefits received offer duties done. H.

Students'

Path

NATURE

THE sun, like a golden knot on high,
 Gathers the glories of the sky,
 And binds them into a shining tent,
 Roofing the world with the firmament.
 And through the pavilion the rich winds blow,
 And through the pavilion the waters go.
 And the birds for joy, and the trees for prayer,
 Bowing their heads in the sunny air,
 And for thoughts, the gently talking springs,
 That come from the center with secret things---
 All make a music, gentle and strong,
 Bound by the earth into one sweet song,
 And amidst them all, the mother Earth
 Sits with the children of her birth;
 She tendeth them all, as a mother hen
 Her little ones round her, twelve or ten;
 Oft she sitteth, with hands on knee,
 Idle with love for her family.
 Go forth to her from the dark and the dust,
 And weep beside her, if weep thou must;
 If she may not hold thee to her breast,
 Like a weary infant, that cries for rest;
 At least she will press thee to her knee,
 And tell a low, sweet tale to thee,
 Till the hue to thy cheek, and the light to thine eye,
 Strength to thy limbs, and courage high
 To thy fainting heart, return again,
 And away to work thou goest again.
 From the narrow desert, O man of pride,
 Come into the house, so high and wide.

-- George MacDonald Selected

The Philosophy of Giving

THE philosophy of giving lies in the fact of our divine origin. We came to this earth to give. We came as Divine Beings to incarnate in, or overshadow, less progressed entities than ourselves, and by close contact quicken their evolution, thus fulfilling the primary law of Brotherhood. Since this is so, as Theosophy teaches, we cannot view ourselves as less than immortal Souls, and therefore that bundle of contradictions, vices, sentimentalities, and weaknesses, we so often take ourselves to be must be something apart from our real natures.

And this is so. The reflected light of the Divine man quickens the intelligence of the animal form which, in the upward march of progressive evolution, he has come to aid, bestowing the priceless gift of self-consciousness, the distinguishing characteristic of humanity; but in doing so he seals his doom to an age-long martyrdom until he gains control over all the turbulent desires of the *personal man*.

Strutting about in the borrowed plumes of the reflected light of the Divine Ray, the personal self considers itself to be the "be all and end all" of human existence, fancying the desires of material separative life to be the realities of life, denying its divine parentage and seeking satisfaction in "the transitory and

the perishable." But upon this path of delusion peace and rest can never come.

Giving is the divine prerogative of the Immortal Self, the link between the incarnate Ray and the Divine Parent Light, the one chink through the darkness of material existence through which wisdom may enter, to reach which "we must reach self-knowledge, and self-knowledge is of loving deeds the child." Our foes are the "foes of our own household," the dark forces of selfishness and ignorance, and only as "Children of Light" have we the power to disperse the ignorance. Because we are the incarnate Ray we have the powers of discrimination, choice, unselfish self-sacrifice, as indestructible weapons with which to face the foe, "the unprogressed lower nature," as our Teacher Katherine Tingley so graphically expresses it.

It is natural for children to cry for the moon until they acquire a sense of proportion; and so with ourselves, when we view life through the proportion-destroying mists of the selfish desires, that pertain to the animal kingdom, when quickened *but not yet dominated* by the inner Divine Light. But surely it is time to cease crying for the reflection of the sun, and to turn to the Sun itself, to bend our energies to increase the power of giving, to be in action sons and daughters of the Sun—the Spiritual Central Sun that "lighteth every man that cometh into the world." W.

The Universal Unrest

WHY is there such confusion among men today? Rattle, crash, jolt, and babble in our great cities! Discontent before the fireside! Devastation in our forests! Even the native of the Alps has shut himself within a circle of hoofmarked filth and mud, and will not lift his eyes to the sparkling peaks.

Truly there is no longer need of such wretchedness, for the beautiful teachings of Theosophy, the Wisdom-Religion, have been brought back to men. Life, perhaps, is so purposeless! Yet, suppose you know that your real Self, the Soul, is ever at one with the Self of the universe; that the Higher Law would guide all that is discordant without to the harmony within, could we but listen to its voice and obey.

Does the daisy begrudge the buttercup the ground that sustains her, or attempt to draw all the rays of the sun upon herself? No, she rejoices in her place in the fields. Lift up your eyes to the sun within you, and be happy to share its warmth with your neighbor. The little robin contentedly tucks its head under its wing at nightfall when the time has come for a rest. Such is the Law, and the creatures do not doubt.

Then why should we mourn in sackcloth and ashes when a day upon earth of our Infinite Life is ended? Such is the Law, and we should not doubt. It is but the things of sense we relinquish for a period. We shall return to earth in due time and resume our duties with renewed vigor and ripened experience. Nor shall we ever find ourselves stranded, but will be led to our proper post just as surely as the little sparrow, returning from his winter sojourn, is led to its familiar thicket.

"The wheel of the Good Law moves swiftly on. It grinds by night and day. The worthless husks it drives from out the golden

grain, the refuse from the flower. The hand of Karma guides the wheel; the revolutions mark the beatings of the karmic heart."

Then cease this continual strain for mine, and deliver yourself to the hands of the Good Law. Do your simple duty; serve others, and the joy you have searched for so long will be at hand.

STUDENT

The Quest

SINCE time immemorial the soul's long journey towards the goal, the ideal, has been symbolized as the going forth of a knight in search of a treasure, the most precious of all things on earth. To us, the legend best known is that of the Quest of the Knights of the Round Table for the Holy Grail, the sacred cup which was of itself but a symbol of the Christ, the Pure Light, the Jewel in the Lotus, the real "I."

The tendency has been to forget that all these legends of the Quest are but pictures which symbolize and mirror the inner search and travail, the inner conquest and achievement. King Arthur may or may not have existed. To the true student that matters not for he stands as the type and picture of a great Teacher — of whom the world has known many — sending forth his students, who were Knights and Warriors, on this Quest of the Holy Grail, the sacred chalice which none but the pure in heart could ever hope to find.

Little by little, we, as a race, are emerging from the dark age of literal interpretation of these great truths and are entering the sunlight by which we can read them with the eyes of the spirit. We are at last beginning to realize that the Quest is not an outer journey, but an inner pilgrimage and battle. Not less real are the foes we meet because they are unseen. They are more real, more terrible; but more real and far greater than all physical warrior-strength is the Soul-strength with which we may conquer them if we will.

And what is the goal, the height upon which we may rest, the reward, the sacred Cup? Truly, to find it is to find the Self; to conquer the foes that hedge in the path on either side is to unbar the Golden Portals which remain forever closed to the knocking of the hypocrite, the demands of the selfish, the petitions of the cowardly and the weak.

The purity, without which the real Quest will forever end in failure, is not that of the passive saint, but of the active aggressive Spiritual Warrior. The Quest leads through dark ways and the valley which lies in the Shadow, but always may be seen the glowing Grail by those who look up, and upon the mountains, whose summits shrine the Chalice, there shines the Eternal Sun.

S.

THEOSOPHY is sometimes called the Wisdom-Religion, because from immemorial time it has had knowledge of all the laws governing the spiritual, the moral, and the material.

The theory of nature and of life which it offers is not one that was at first speculatively laid down and then proved by adjusting facts or conclusions to fit it; but is an explanation of existence, cosmic and individual, derived from knowledge reached by those who have acquired the power to see behind the curtain that hides the operations of nature from the ordinary mind.—William Q. Judge

THEOSOPHICAL FORUM

Conducted by J. H. Fussell

Question In last month's issue of the *Atlantic Monthly* is discussed the question, "Is Immortality Desirable?" The article is thoughtful and interesting, and the conclusion of the writer is that immortality "is desirable, if immortality means a fortunate issue of the quest of our souls." Still there seems to be something lacking from the treatment of the subject. How would you look at it from the standpoint of Theosophy?

Answer Is immortality desirable? To, or for, what? Desirable for man? What then do we mean by man? What meaning do the great majority attach to the term "man"? Does not our whole civilization proclaim man as self-seeking, pleasure-loving, ambitious? How much spirituality is there in average humanity; and how much of the animal, or the purely intellectual—that is, with a brain-mind intellectuality divorced from all the deeper aspirations of the heart? Is it to these that the question is put, or only to those who like the writer "agree with the poet Browning that 'little else is worth study save the development of a soul' "? And who hold that:

The distinctions between people that finally matter are not those of wealth or rank, or of what is called success or failure; they are those of growth of soul. This to me is the bottom fact of experience. . . . What then is it which this which I call "the soul" seeks? It seeks what is good; . . .

With all of which we agree. Yet the question must be answered for those who do not recognize or are ignorant of this "bottom fact of experience"; and these are the majority of mankind. How would they answer the question if it were put to them? How else could they answer it than according to their experience and according to the main quest of their own lives? And if we find that there is little in their lives that is worthy of immortality, or if to them from their standpoint immortality be undesirable, shall we regard it as an argument against immortality and as tending to disprove it? Are we to assume that immortality is desirable only for those whose quest is the quest of the soul? Is immortality only for them, or will some miraculous change take place at death in those whose quest is otherwise, a change which shall transmute their desires and awaken in them that which shall make immortality desirable?

The writer seems on the verge of a satisfactory answer for himself, yet his final conclusion is hampered and weakened by a proviso, a doubt: "if immortality means a fortunate issue of the quest of our souls."

What then is lacking? Is it not a true conception of life, a true philosophy, trust in universal Law, faith in our own selves? Is not the very asking of the question tantamount to saying that there is a doubt as to whether the purposes of life, the end towards which all things tend, may not after all be evil rather than good? "If immortality means a fortunate issue"? Are we in doubt then; do we fear that the quest of our souls may not have a fortunate issue?

That such a question should be asked is truly a sign of the times, an indication of the uncertainty, the lack of real knowledge of the present day. Instead of seeking to know the law and then endeavoring to bring our wills and lives into harmony with it, we call into

question the law itself and discuss its desirability, as though desirability were a test of its reality.

In the present day we are too prone to consult our desires and in consequence our view of life is enormously distorted. What have our desires to do with the laws of being, save that it is our place and duty to seek knowledge of those laws and then to make our desires come into harmony with them? Where is our trust in the stability of the Universe and that it is governed by Law? We have lost knowledge of the true nature of man and his relation to the Universe. Our divine powers have been so little used that they have atrophied, and in many cases their existence denied.

We do not ask if the law of the Conservation of Energy be desirable, or the law of Gravitation; we recognize them as laws and seek to act in accordance with them, making use of them and bringing them into service. But it may be said that the laws of nature such as these are open to investigation, but that we cannot know whether immortality be true or not. Can we indeed not know? Why? What is the cause of our ignorance? Is it in the very nature of the problem?

Some there are who spend time and energy in what they call psychical research, spook hunting, etc.; others seek by various means to call back the dead. But how pitifully mistaken they are, in many cases how selfish and unthinking! And those who seek in this way can never reach the object of their search; knowledge and certainty of immortality can never be so gained.

Theosophy teaches us that *we can* know, and points the way to the attainment of such knowledge. It can never be gained from an external source. The teachings of the great Helpers of Humanity in all ages, which are to be found in the world's sacred books, all are helpful, but are only aids, pointers, and of themselves are not sufficient. There is only one way by which this knowledge may be gained:

Live the life necessary for the acquisition of such knowledge and powers, and Wisdom will come to you naturally. (*The Secret Doctrine*, I, 167)

This same teaching was given by Jesus; it has been given in all ages by all the great Teachers, and it is the message of Theosophy. All have taught the divinity of man and his consequent immortality. Without the former there could not be the latter. Man's nature is dual; there is the higher, divine nature, man's true self, his divine Ego, or Soul; and there is the lower nature, the personal, selfish, brain-mind man with his animal passions and desires. The latter is the man that we too often think ourselves to be. The former our real Self, is immortal; the latter, mortal, transitory. The latter is the instrument or vehicle through which the real man gains experience and contacts the outer, manifested world.

There is continuous warfare being waged between our two selves; continually we have to choose which of these selves we shall be; and out of the struggle, when death comes, whatever there may have been of high endeavor, of altruism, of pure aspiration and noble striving—the essence of it all, the aroma, is taken up by the immortal Self and woven into its own imperishable vesture.

And after the rest that follows what we call

death the Ego comes into another physical body which has been built up for it, and enters upon the struggle again, to reap again the harvest of seeds sown in former lives, and finally to indraw into itself again at death of the body all that is akin to its own divine nature.

Shall we ask "Is immortality desirable"? Let us be men and women; let us play our parts nobly. Let us look for that which is true, and make our lives conform to it. Do our desires run counter to it; what then are our desires that we should be ruled by them? Let us ask who and what we are; let us look into the inmost recesses of our being, and find the Divinity there; let us there take our stand and rule and control our desires, our minds and all our powers.

The keys to the understanding of life and death have for ages been lost. No wonder that immortality is questioned, even denied, in the face of materialism on the one hand, and on the other, of the orthodox religion of today, which teaches one life on earth and an eternity of hypothetical character in some unknown place or state; and the illogical doctrine that for the finite acts of one short life one reaps infinite and eternal results; or, as some teach, that no matter what one may do, if foreordained to hell, his good acts avail nothing.

No wonder men and women have revolted from the domination of the Churches; no wonder that, lacking any sound philosophy of life, they have drifted into agnosticism and materialism.

Yet the Churches had one of the keys in its early days, but at one of its Councils cursed any one who should teach or use it, though Jesus himself gave authority to it. This is the teaching of Reincarnation. Other keys within the reach and comprehension of all are the teachings of Karma, which is the law of justice, of sowing and reaping; the law of Cycles; and the teaching of the Divinity of man and Universal Brotherhood. If these were applied by us to our lives, if only we had faith enough in our own souls to take the first step in devotion to the true welfare of others, and to purify our own lives, we should not have to question on these things, for we should see the gates of knowledge opening out before us.

In the light of Reincarnation, death loses its terrors; the after-life is seen to be a period or night of rest between two days of earth-life; the future appears as the logical outcome of the past. Accepting the teaching of Theosophy, the future unfolds in life after life of glorious service, and height rises beyond height until we shall stand perfect as the Father in Heaven is perfect—one with Divinity, one with Life itself

STUDENT

I MYSELF never was not, nor thou, nor all the princes of the earth; nor shall we ever hereafter cease to be. As the lord of this mortal frame experienceth therein infancy, youth, and old age, so in future incarnations will it meet the same. One who is confirmed in this belief is not disturbed by anything that may come to pass. . . . As a man throweth away old garments and putteth on new, even so the dweller in the body, having quitted its old mortal frames, entereth into others which are new.—*Bhagavad Gītā*

THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY

FOUNDED AT NEW YORK CITY IN 1875 BY H. P. BLAVATSKY, WILLIAM Q. JUDGE AND OTHERS
REORGANIZED IN 1898 BY KATHERINE TINGLEY

C e n t r a l O f f i c e P o i n t L o m a C a l i f o r n i a

The Headquarters of the Society at Point Loma with the buildings and grounds, are no "Community" "Settlement" or "Colony." They form no experiment in Socialism, Communism, or anything of similar nature, but are the Central Executive Office of an international organization where the business of the same is carried on, and where the teachings of Theosophy are being demonstrated. Midway 'twixt East and West, where the rising Sun of Progress and Enlightenment shall one day stand at full meridian, the Headquarters of the Society unite the philosophic Orient with the practical West

Churches Behind the Times

THE profession of the ecclesiastic has not kept pace with the enormous advance in popular education. A hundred years ago ministers were the educated men of their communities, and their power was in proportion. Since then, congregations have risen in intelligence, law and medicine have kept pace, but the church has relatively fallen back. The ministers are too often of low efficiency, and content themselves with chronic cases and specific remedies, while the great moral problems go untouched. Men of real intellect and devotion usually turn back from the ministry and go into literature, business, and professions.

Such is a sample of the complaints we frequently read in religious papers. Bearing on what is really the same subject, is a remarkable article in the Berlin *Zukunft*, which is reproduced in part in *Current Literature*; it is an imaginary conversation between Mr. Rockefeller and Count Tolstoy. Each criticizes the other and upholds his own gospel and mission in life. The magnate accuses the prophet of being retrograde and says that his gospel is all out of tune with modern needs and would bring disaster if it could be followed out. We are not concerned with vindicating the magnate or indorsing his strictures on Tolstoy; but few will deny that Tolstoy's gospel (which, by the way, he appears to have recently abandoned) is out of touch with present human needs. It is not founded on the teachings of Christ so much as on a particular interpretation or travesty of them. The eremitic idea, that of repudiating all the fruits of invention and regarding this life as a mere painful episode of introduction to a future life off the earth, is a doctrine that has been grafted upon the teachings of Christ. Man is endowed with mighty faculties of conception and desire; he is called upon to master them, not to kill them out. To bring all his faculties under the rule of his Will, guided by the Law of Right, is man's goal; if he rejects this task, those faculties will escape control and lead him astray.

Hence the churches must keep pace with the development of man's intelligence and with the expansion of civilization; their gospel ought to be adaptable to every case that can arise. But it has not been so. For instance, when the scientists of last century inquired into Nature and discovered a part of her laws of

MEMBERSHIP

in the Universal Brotherhood and Theosophical Society may be either "at large" or in a local Branch. Adhesion to the principle of Universal Brotherhood is the only prerequisite to membership. The Organization represents no particular creed; it is entirely unsectarian, and includes professors of all faiths, only exacting from each member that large toleration of the beliefs of others which he desires them to exhibit towards his own.

Applications for membership in a Branch should be addressed to the local Director; for membership "at large" to G. de Purucker, Membership Secretary, International Theosophical Headquarters, Point Loma, California.

development, the churches, instead of leading them on the right path, denounced them and left them to go on the wrong path. And now that all kinds of speculations about the inner nature of man are being indulged in, the churches have no guidance to offer, and are sometimes denouncing, sometimes ignoring, and sometimes following meekly in the rear.

The tide of modern progress cannot be held back; it must be directed. And for this we need a wide comprehensive teaching that will show how to apply the true principles to every case.

Those who feel in themselves the call to useful work, seek their field outside the ministry and go into other callings. Thus, in a way, there is a larger church formed out of people who do not know each other but are connected inwardly by their common aspiration to broader ideals. And while this church of the future is slowly forming itself, the old churches linger on as an anachronism. STUDENT

Ideal versus Practical

JUBAL AND TUBAL CAIN.

Jubal sang of the Wrath of God,
And the curse of thistle and thorn—
But Tubal got him a pointed rod,
And scrambled the earth for corn.
Old—old as that early mold,
Young as the sprouting grain—
Yearly green is the strife between
Jubal and Tubal Cain.

Jubal sang of the new-found sea,
And the souls its waves divide—
But Tubal hollowed a fallen tree
And passed to the farther side.
Black—black as the hurricane wrack,
Salt as the under-main—
Bitter and cold is the hate they hold—
Jubal and Tubal Cain!

Jubal sang of the golden years
When wars and wounds shall cease—
But Tubal fashioned the hand-flung spears
And showed his neighbors peace.
New—new as the Nine point Two,
Older than Lamech's slain—
Roaring and loud is the feud avowed
'Twixt Jubal and Tubal Cain.

Jubal sang of the cliffs that bar
And the peaks that none may crown—
But Tubal clambered by jut and scar
And there he builded a town.
High—high as the Passes lie,
Low as the culvert's drain—
Wherever they be they can never
agree—

Jubal and Tubal Cain!—Kipling

BUT Jubal and Tubal are mutually necessary; neither can get on without

the other; ideality and practical ability are both necessary to humanity. The man who has them both in full measure is greater than either Jubal or Tubal. And we ought to round out character so as to develop it in all directions; still, if we cannot be both Jubal and Tubal at once, we can at least be one of them and recognize that the other is *not* our enemy but our friend. For oppositeness does not mean enmity; and in the larger unity of man, Jubal and Tubal are like a pair of hands, or like a hand and a head.

Often nonsense is talked about practicality being the only real thing and ideality being useless waste of time; or else it is the practical man that is the fool and the idealist who is the real sage. These views are too narrow. There were the twin brothers, Castor and Pollux, who never appeared at the same time; there was a whole family of "Gods"—Apollo, Vulcan, Mercury, etc., representing different sides of human nature and of cosmic nature. The mind has its freedom-loving, soaring aspect, and its formalizing, methodizing aspect. We ought to recognize that there is room in us to develop all sides of our character, however opposite they seem. T.

THE Fall was the result of man's knowledge, for his "eyes were opened." Indeed, he was taught Wisdom and the hidden knowledge by the "Fallen Angel," for the latter had become from that day his *Manas*, Mind and Self-consciousness. . . . *Lucifer*, or "Light-Bearer," is . . . our *Mind*—our tempter and Redeemer, our intelligent liberator and Savior from pure animalism. Without this principle—the emanation of the very essence of the pure divine principle *Mahat* (Intelligence), which radiates direct from the *Divine Mind*—we would be surely no better than animals. The first Adam was made only a *living soul* (*nephesh*), the last Adam was made a *quickening Spirit*—says Paul, his words referring to the building or *Creation* of man.—From *The Secret Doctrine*

THE THEOSOPHICAL ADDRESS AT ISIS THEATER

THE announcement of a Râja Yoga program at Isis Theater is always sure to draw a big house, and last night was no exception to the rule. The entire program was in the hands of pupils from the Râja Yoga Academy at Point Loma, and a most delightful hour and a half had been arranged. No wonder that people ask what is the magic of Râja Yoga when they see the marvelous results, the manly bearing of the boys, the sweet dignity of the girls, their clear intelligent eyes and bright healthy countenances. And when one listens to their music, whether solo or ensemble work, one cannot but realize, if one thinks at all, that these young people are weaving strands of harmony into their own lives and the lives of all who come into contact with them that cannot fail of having a great influence in the upbuilding of character.

Two addresses were given, with the following titles: "The Problems of Life and How to Face Them" by a Râja Yoga girl; and "The World's Problems and How to Meet Them," by a Râja Yoga boy. Both subjects were well handled and the treatment showed much thought and good reasoning and perceptive powers, and not only an appreciation of the problems of life such as many an older person might be glad to have, but also a sound philosophy as to the way in which they must be met. (From the *San Diego Union*, June 7, 1909)

The former of the young speakers, after referring to the many problems that each must meet, said that as a rule, when boys and girls finish their school course they are very well informed about their studies, and that is good and very necessary; but of more important things—their divinity, their dual nature, what they must contend with in their everyday life—they are totally ignorant. Unprepared they go into the world, and if they happen to have strong wills and intellect and compassion they do their utmost to help things along in the right direction; but they do not seem to have the secret which will give the divine touch that will make them successful in the best sense of the word. . . .

The inordinate selfishness and cupidity and utter lack of compassion which mark the present age are the result of generations of ignorance of the laws of life. These faults are at the bottom of most of the problems that stare us in the face today, and they can only be removed by the eradication of the terrible desire every one has for self-advancement at any cost to others. When Theosophy becomes a veritable force in the life of Humanity these problems will disappear, for there will be nothing to feed the conditions which give them life. Man must go to the root of his difficulties to eradicate them, for it is no use to cut down a weed and let the roots remain. . . .

We must take a positive stand now and face these problems with the determination to solve them, turning on them the highest efforts of which we are capable, until the heart life has been started to burn brightly. What is the magic power that will do this? Go to Point Loma and a chorus of voices will make ready answer: "Theosophy a living power in the lives of all men!"

OBSERVER

The Plot Against Imagination

A N "Old Historian" writes warning the promoters of the Welsh Pageant to use subdued color—to avoid tea-tray landscapes, and stick to nature. "I learnt my lesson, one day," he continues, "when tramping in connection with the Cambrian Archaeological Association. We were told that in a certain Welsh vale a prince had resided, had been engaged in a historic event, had been slain, and the victim had been canonised. We found the vale, entered the dwelling, which was only one degree bigger than an ordinary farm, and the surroundings were in keeping, and, in my opinion at least, the prince was a very ordinary person, just a remove from a rural laborer of the district."

The above, from the *Cardiff Times and South Wales Weekly News*, gives illustration of a certain tendency of the age. There are some of us that proclaim our desire for truth; but all we want is further to hinder imagination. We must level down things; abolish the peaks for the sake of the plain. One can but ask what value can be supposed to lie in such doctrine? Are we likely to become better men for it?

Suppose the prince's palace was only a little bigger than a modern farmhouse; that does not make the man himself the least bit like the modern farmer. There is an altogether false standard of judgment set up here; and it is we, not the ancients, who are to be left the poorer. They are beyond the reach of our pilfering; but we can rob ourselves of mental riches.

Our lives are poorest in one thing, imagination. We hate to be disquieted with reminders of the beauty and mystery of things. There are birth and death for our forward and backward horizons, and innumerable mysteries and glamor gathered around each; there are the sea and the land and the mountains about us daily, confronting us with perpetual marvelous questions; they "invite our souls" continually, but we are afraid to make response. A little stream of consciousness trickles through us; "I," we say; and within that "I" is some kind of motion, some kind of feeling; beyond it we are careful not to look. But the stream argues an ocean; and the ocean does exist and is full of wonders. No wonder we are the small men we find ourselves. We have chained up Pegasus—imagination in miserable stables and clipped his gorgeous wings; he that might have taken us soaring through the blue and shown us all creation, preservation, and renewal, is doomed to mope, and even to go bespattered half the time, and filthy.

Set him free; that is the road to national greatness! Let him breathe the upper air, and have done with sewer gas. Great men and great periods do not block up what roads are open to them with a negation and a sneer. Rather they spur along them, in search of what burning blossoms may be found by the wayside. England had her spacious days in the reign of Elizabeth, when all horizons had flown back suddenly millions of miles; and men dared go forth eager after beauty and mystery. On the whole, she has not equaled those days since; the waves of inspiration have not again beaten up so mightily. That there were sordid things doing then, as now, does not alter the grand facts; men's eyes were not glued down to the sordid, as we so often elect that our eyes shall be. For Drake and Raleigh and Shakespeare there was an illimitable splendor in things, and an incessant

call to seek the splendor. Yes, says your modern critic; but Drake was this and that; Shakespeare was all for money and made a fat living on his plays; Raleigh was—Tush! Is this food you are offering us, or miserable bran and sawdust? Is it medicine, or only a poisonous drug? We know that man is dual in his nature; if they did evil, it is all interred with their bones; the good, could you see it, dull Bat's-eyes, is flaming over the sky like a sunset. Besides, you have raked up that evil more from your own lower nature than from their coffins; stop judging the mighty.

Here is one point: your modern rural laborer has his own feelings and limitations; those of the old princes and warriors were hugely different. They had at least, unlimited ideas in one direction: they believed in the merit of manhood; they had a royal contempt for fate as against the magnitude of a certain power to be found in man. This prince may have lived in what was little better than a farmhouse; but would to God we could recognize in ourselves some of the factors that burned in his consciousness. Perhaps he was selfish and ruthless, perhaps stained with a thousand faults; but it was the first letter in his creed, right down in instinct and not to be considered or argued about, as natural as breathing, that in all his struggles with men and fate he must give odds to the opposing side, and win or fall on the simple strength of his own bravery. He went into battle bare-breasted, and took victory or defeat so, from men encased in protecting steel; and there is something in that which sets the imagination ablaze, and can make better men of us, whoever we are.

True, we ought to have learned many lessons since then. The wide world has opened up before us, and we might know a million truths to his one. What greatness he had, came down and down to him; it was not the product of those dark ages, but one of a few heirlooms at that time not yet lost; as if one should find, as Matthew Arnold says, the rare-carved stones of ancient Ephesus built into a peasant's hut. Or better still, some old and magical stone; a fragment of the vocal Memnon, still melodious at the dawn; a stone gifted with speech, and potent to disclose mysteries and the secret grandeur of life. There was still a certain light shining round those exhaustless warriors, which we ought to draw into our own lives.

Anything that is to be of worth to us must speak of the divinity of man. Lay hold upon that, patriots! Lay hold upon that, lovers of mankind! Convince yourselves that all greatness, and even the continuation of life itself, depends upon us men, and whether we bring forth the splendor locked up in us. Set free Pegasus; do not leave him to perish of ennui any longer. There are regions in the sky for him to traverse, where untold jewels are stored and waiting for mankind. Have we never heard of a certain Kingdom that "must be taken by violence, and the violent attain it"? How are we to reach its gates, except with the aid of his wings?

KENNETH MORRIS

BEHOLD beneath the dark and turbid waters how the soul's creative beauty reared the lotus now expanding clad in stainless snowy garment greeting glorious sunlit day.—Z.

Chemical Theories Revised

ELECTRIC sparks can be passed through a mixture of carbon monoxide and oxygen without explosion. This statement would surprise some writers, because it is matter of familiar knowledge that these two gases have a remarkable affinity for each other and are ready to combine instantly with explosive violence on the slightest provocation in the nature of a flame or spark. Yet any text-book making this latter statement would be incorrect—incorrect in the way they so often are, not in statements that are directly false, but in statements that are incomplete; it takes an ample mind to think of all the possibilities and overlook none.

The fact which some of the text-books seem to overlook is that if the two gases *have been carefully dried* they will not combine. This fact was ascertained as long ago as 1880 by Professor H. B. Dixon (says a writer in the *Scientific American Supplement*). The reason why it has been overlooked is that the gases used in ordinary experiments never are dry; for it is no simple matter to dry a gas thoroughly. But just think what this means! It means that the experiment had usually been improperly performed; for, instead of using a mixture of carbon monoxide and oxygen, the experimenters had been using a mixture of carbon monoxide, oxygen, and *water vapor*!

Now we have some of the scientists by the ears. A chemist undertakes to test the behavior of a certain mixture; and, in order to do so, he invariably takes another mixture instead, and proceeds to record the results and even to dogmatize upon them, precisely as if it were perfectly indifferent which mixture he used. What can we think of scientific accuracy and logic after this?

It might be considered captious to make such a point out of this if it were an isolated case; but the trouble is that it is not; it seems to be more the rule than the exception. In 1884, we are told by the same authority, Professor Dixon's pupils proved that *carbon, when heated to redness in an atmosphere of oxygen does not combine with it!*—and all the text-books go into the waste-basket again; for this is one of their favorite dogmas, absolutely necessary to salvation. But worse followed. Sulphur can positively be distilled in oxygen without burning; and—the last straw—even phosphorus, the beau ideal of inflammability, can also be distilled under the same circumstances and with the like absence of results. In all these cases the oxygen has to be perfectly dry; that is to say, it has to be oxygen and nothing but oxygen.

Later experiments proved that ammonia gas and hydrogen chloride can be mixed without combining; that ammonium chloride can be converted into a true vapor, instead of dissociating as usual; and that several other familiar reactions fail when the substances are pure. In 1902 our last atom of faith was reduced to rags by the discovery that *oxygen and hydrogen—oxygen and hydrogen!—can be heated to redness without any explosion*, provided water be absent.

Thus we have the facts that phosphorus, carbon, and hydrogen positively do not combine with oxygen under the influence of heat; and the exact contrary forms one of the most deeply rooted and important dogmas of all the

text-books. The case does not rest on these few facts, for they are only samples. Taking all together, we reach the conclusion that *the whole theory of chemical combination has been based on spurious experiments*, in which the operators have unconsciously palmed off on us mixtures other than what they have asserted them to be. They have built up an elaborate study of the behavior of oxygen based upon experiments in which oxygen itself has never been used *alone*, but always a mixture of oxygen and water. And it is upon the basis of such marvelously careless observation and such very erroneous inferences that we are asked to bow down the knee. Yes, scientific opinions are quoted with awe; but the careful and prudent mind will be excused for hesitating before swallowing with his eyes shut whatever he may be told.

The above facts seem to show that scientists are about as infallible as the Pope of Rome, and with about as much justification. Also they show the same facility in reversing their decrees whenever occasion seems to demand it. For what is even more marvelous than the facts just quoted is the cool nonchalance with which they are brought forward, without the slightest hint of any idea that a total inversion of previous statements in any way discredits a great and reliable authority. Facts like this, which are constantly occurring, should be noticed; and in view of the authority which is often claimed over the empire of our minds, they should be rubbed in, and well rubbed in.

To account for the action of water in effecting combination between other substances, various theories have been framed. It has been thought to act as a kind of go-between, taking an atom from one substance and giving it to the other. There have been thermodynamical theories to explain it. The writer of the article cited considers the influence of water in connexion with the influence of ionization, and reaches the conclusion that "ions and water vapor (or some similar substance) must both be present in a mixture of gases if action is to take place."

Thus the old theory that combination is the result of chemical affinity, the atoms tumbling together, as it were, is knocked on the head; and one now begins to find out that *no act can take place without an agent*. Already we have water vapor, "or some similar substance," and ions. The gases will not and cannot unite until these mysterious ions are there to go about and hustle the atoms. And even that is not enough; for everywhere there must be water. If this is not the old alchemy coming back, it certainly is very much like it. Just call the ions "fire"—no inapt name for them—and we have at once Fire and Water as the two great magicians in nature.

The era of "dead forces" is over. The atoms do not tumble together; they are brought together by active living agents. The 19th century evolution theory represents the living species as gravitating helplessly along lines of least resistance until their mutual pressure squeezes, so to speak, a few out of the top of the pile. Soon Science will find that no more than oxygen and hydrogen, can animal forms do anything without the impulse of some separate active agent. The planets have been represented as falling, dropping, tumbling through empty space; but sooner or later science will find that they too have their

agents which propel them in their cycles.

Thus "chemical affinity" has been shown by science itself to be just what Theosophy has always said it was—the name for an effect. It is no cause and cannot do anything, any more than "velocity" can run a street car. It may be an amusing and satisfying thing to say that the street car is actuated by the force of velocity; but the hurried passenger might be excused for insisting that gasoline or electricity be used. And so it must be with attraction, gravity, etc. They are the results, not the causes. To say that a magnet attracts a piece of iron by the force of attraction is twaddle; and so it is to talk about the force of gravitation as if the effect were the cause. We do not happen to see what influences the iron or the apple, but someone may find it out any day.

Finally, observe how ancient ideas are being vindicated. Here we have, as the great magic agent, *Water*; and that in no mere symbolical sense, but literally. And we have these mysterious electro-atomic forces or substances, for which the most appropriate name seems to be *Fire*, for they are not solid nor liquid nor gas, nor yet do they come under the scientific category of "forces." H. T. EDGE, B. A. (*Cantab.*)

Spiritual Heredity

BROWNING'S LINEAGE

BY HENRY VAN DYKE

How blind the toil that burrows like the mole,
In winding graveyard pathways underground,
For Browning's lineage! What if men have found
Poor footmen or rich merchants on the roll
Of his forbears? Did they beget his soul?
Nay, for he came of ancestry renowned
In poesy through all the world, and crowned
With fadeless light that shines from pole to pole.

The blazons on his poet's shield are these:
The flaming sign of Shelley's heart on fire,
The golden globe of Shakespeare's human stage,
The staff and script of Chaucer's pilgrimage,
The rose of Dante's deep, divine, desire,
The tragic mask of wise Euripides.

—From *The Atlantic Monthly* (February)

THE rhetorical question, "Did they beget his soul?" is surely equivalent to a most indisputable negative. Who will venture to affirm that the footman and the rich merchant begat Browning's soul?

Yet there are many who reason as if they believed that were the case; or so one judges from much that is said about heredity. Parents afford conditions for the incarnation of Souls; and if their lives are pure, they will afford pure conditions. But the Souls have another lineage. Heredity is of several kinds; they may be roughly classed as three: physical, psychic, and spiritual. The parents provide the physical heredity; psychic elements are drawn in from the surrounding thought-atmosphere of the country and race; the Spirit descends from its place of rest to earth-life. We do not consider these other kinds of heredity sufficiently. It is the continual incarnation of Souls that gives fresh impulses to progress and prevents interminable transmission of the same types—or rather, a retrocession towards a primitive type—such as mere physical heredity would produce. Altogether it seems a considerable waste of time and energy to be constructing such elaborate theories out of such a meager stock of data; for the facts known to materialistic science constitute but a small fraction of the problem. STUDENT

Art Music Literature and the Drama

The Sine Qua Non of a Good Voice

AT the Conservatoire of Ghent, as we read, the professors in council urged the arts and science faculties of the university to give more attention to the study of the voice; for they regard the voice as offering the best criterion of the physical and mental state of progress. It was suggested that the complete and full use of the voice was not attained until the vertebral column structure and that of the brain had reached their full development.

Among the pupils of the Conservatoire it had been found that backwardness in the tones generally corresponded with an incomplete development of the mental faculties and a weakness in the condition of the spinal column. There was also noted a disposition to anaemia. Those suffering from spinal infirmities and mental troubles were incapable of good singing.

The condition of the voice after the change to adolescence afforded an indication of the mental and physical development. The man or woman of the uncertain voice, alternating between the shrill and the gruff, were invariably of the erratic and whimsical order; but a change for the better in their character is accompanied by a corresponding steadying of the voice.

The moral drawn was that the voice of youth should be cultivated, but without being forced.

Thus, in this case, as in so many others, we get back to the root of the matter—that mental and physical balance and strength are the prime requisite. Without these nothing can be achieved except imperfect results produced by artificial devices. This is why so many highly trained singers, even among those having a reputation, fail to please the impartial and unsophisticated hearer. This critic, unlearned in technicalities, judges by the sensations conveyed to him; nor do the effects of consummate art avail to hide from him the real harshness of the painfully-produced vibrations that tell of a weak, unbalanced nature strained in the grip of a determined will.

More than any other feature does the voice reflect the condition of the nature. Anatomically speaking, it may proceed from the throat, but actually it proceeds from the entire man. It is a kind of audible manifestation of the quality of his soul; when his voice vibrates and his tones ring, we feel the ringing and thrilling of his nature. To have a good voice he must be well and strong and hearty; he must be clean and whole-souled. He cannot impose upon the candid hearer; he may disguise his weakness, but he can not disguise the disguise.

And how many have unimpaired nervous systems and healthy spinal columns and cool, steady brains? As few, in this civilization, as have good voices. The most competent singing teacher who tries to supply the lack of this

prime requisite has an uphill task, and will have to shoulder blame which he has not incurred. Give him the prime requisite and he will know how to guide its manifestation wisely without forcing.

And, as health supplies good tones, so we can work the opposite way and use the right cultivation of the voice as a means of aiding in securing health. But this will be of little use unless accompanied by the other means of securing health. Voice culture, therefore, forms a part of the general culture of the faculties, a part of the regular curriculum in a

rightly conducted school, college, or university.

Not only in singing, but in public and private speaking, is a good voice production needed. So many speakers are heard only with extreme difficulty, and so many others produce a painful impression. All children should be taught (1) to produce a fine, full quality of tone, coming from the inner core of the nature and not from the top of the head or from a violent contraction of the muscles; (2) to break up this tone into finely formed words.

Again, we convey to other people much of our own quality through the voice—far more than is usually supposed, for the power of sound is great. The tones of the voice, often even more than what is said, can be used as agents in fulfilling the great purpose of helping and cheering.

THE "FONTAINE MOLIERE"

WHAT THE SONNET IS

FOURTEEN small brodered berries on the hem
Of Circe's mantle, each of magic gold;
Fourteen of lone Calypso's tears that rolled
Into the sea, for pearls to come of them;
Fourteen clear signs of omen in the gem
With which Medea human fate foretold;
Fourteen small drops which Faustus, growing old,
Craved of the Fiend, to water Life's dry stream.
It is the pure white diamond Dante brought
To Beatrice; the sapphire Laura wore
When Petrarch cut it sparkling out of thought;
The ruby Shakespeare hewed from his heart's core;
The deep, dark emerald that Rosetti wrought
For his own soul, to wear forevermore.

Eugene Lee-Hamilton

The Pictures of Modern Poetry Anticipated

A SELECTION from the classical poets of China has recently been published. In an interesting introduction it is mentioned that poetry is an almost general mode of expression among the Chinese—indeed verse-making with them "has always been a second nature." A reviewer of the poems points out a curious fact—an anticipation of a pretty conceit of Ben Jonson's by a Chinese poet, 2000 years ago. In his famous song *Drink to Me Only with Thine Eyes*, Jonson tells how he sent his love "a rosy wreath"—

But thou thereon didst only breathe,
And sent'st it back to me,
Since when it grows and smells, I swear,
Not of itself, but thee.

Now in the poems collected by Confucius "about the year 500 B. C.," an unknown poet has a very similar idea, but more poetically expressed:

She has gathered with her lily fingers
A lily fair and rare to see,
Oh! sweeter still the fragrance lingers
From the warm hand that gave it me.

There is something suggestive of Omar Khayyam in the lines describing the desolation of Liang:

There was a king of Liang—a king of wondrous might—
Who kept an open palace, where music charmed the night.

Since he was Lord of Liang a thousand years have flown,
And of the towers he builded yon ruin stands alone!
There reigns a heavy silence; gaunt weeds through windows pry.
And down the streets of Liang old echoes, wailing, die.

"Much the same emotions," adds the reviewer, "which move us today to song, moved these Chinese singers of a long past." A Chinese writer says of poetry:

Poetry has been in China, as in Greece, the language of the gods. It was poetry that inculcated laws and maxims; it was by the harmony of its lines that traditions were handed down at a time when memory had to supply the place of writing; and it was the first language of wisdom. STUDENT

Theosophy is the Science of Life, the Art of Living.—H. P. Blavatsky

IN June, 1878—thirty-one years ago in the present month—Helena Petrovna Blavatsky became a naturalized American citizen.

In that monumental work, *The Secret Doctrine*, she wrote:

... Thus it is the mankind of the New world—one by far the senior of our Old one, a fact men had also forgotten—of *Pâtala* (the Antipodes, or the Nether World, as America is called in India), whose mission and Karma it is, to sow the seeds for a forthcoming, grander, and far more glorious Race than any of those we know of at present. The Cycles of Matter will be succeeded by Cycles of Spirituality and a fully developed mind. On the law of parallel history and races, the majority of the future mankind will be composed of glorious Adepts. Humanity is the child of cyclic Destiny, and not one of its Units can escape its unconscious mission, or get rid of the burden of its co-operative work with nature. Thus will mankind, race after race, perform its appointed cycle-pilgrimage. (Vol. II, page 446)

She also wrote in the same volume:

... Now, Occult philosophy teaches that even now, under our very eyes, the new Race and Races are preparing to be formed, and that it is in America that the transformation will take place, and has already silently commenced. ...

Thus the Americans have become in only three centuries a "primary race," *pro tem.*, before becoming a race apart, and strongly separated from all other now existing races. They are, in short, the germs of the *Sixth* sub-race, and in some few hundred years more, will become most decidedly the pioneers of that race which must succeed to the present European or fifth sub-race, in all its new characteristics. (page 444)

It was the hope and intention of H. P. Blavatsky to found in the West a great Seat of Learning, and this mighty objective was known to William Q. Judge. The same object had been also the dream and hope of Katherine Tingley many years before she became outwardly identified with the present Theosophical Movement. When she became Leader of the Movement, succeeding William Q. Judge, she sought and found an opportunity to carry out her long cherished plans, and finally,

H. P. Blavatsky and America

A NEW ORDER OF AGES

Annuitt coeplis novus ordo seclorum.—The motto upon the reverse of the seal of the United States, adopted June 20, 1782.

The description of this seal is as follows:

Arms.—Paleways of thirteen pieces, argent and gules; a chief, azure; the escutcheon on the breast of the American eagle displayed proper, holding in his dexter talon an olive branch and in his sinister a bundle of thirteen arrows, all proper, and in his beak a scroll, inscribed with this motto, *E Pluribus Unum*.

Crest.—Over the head of the eagle a glory, or, breaking through a cloud, proper, and surrounding thirteen stars, forming a constellation, argent, on an azure field.

Reverse.—A pyramid unfinished. In the zenith an eye in a triangle surrounded by a glory proper. Over the eye these words *Annuitt Coeplis*. On the base of the pyramid the numerical letters MDCLXXVI, and underneath the following motto, *Novus Ordo Seclorum*.

Note.—The reverse of the seal was not cut at the time the seal was adopted, nor has it been cut since.

in 1900, established at Point Loma, California, the International Headquarters of the Theosophical Movement throughout the world.

The Râja Yoga system of education which is verily the voice of Theosophy—crying in the wilderness of modern educational theories and despairs—was originated and is here being demonstrated by this Teacher. Point Loma has become a central radiating-point from which students have gone and are destined to go to nation after nation, to teach that most divine of all sciences and noblest of all arts—Theosophy, the Science of the Soul, the Art of Living.

"Anon the gods descend and anon they return to heaven." There are tides in the affairs of men and of nations and of worlds, and progress is not along some stiff and straight

tangential line or other, but cyclic. In the smoke and grime, in the fever and madness of an age of

materialism and doubt, again the effort was made by Those Helpers who love Humanity, and always have loved it, to show us how to transform into something else the myriad sodden hells of our own making.

It was not an accident that this saving effort was undertaken at the beginning of the last quarter of the nineteenth century, nor that previous similar attempts had been made at the same cyclic point in the passage of century after century. The time was ripe, the materials were ready, and the architect appeared. Nor can we conceive that merely by accident was America chosen as the spot where this supreme effort should be made.

The Christos is knocking at men's minds, is bursting open the barriers that have shut in men's hearts, and the time is come for a universal questioning about things of the inner and unseen life. When honest souls learn that their questions can be answered they will turn to the true Teacher as a flower turns to the light—and all men will turn when they have suffered enough.

STUDENT

SLOWLY but surely it [Theosophy] will burst asunder the iron fetters of creeds and dogmas, of social and caste prejudices; it will break down racial and national antipathies and barriers, and will open the way to the practical realization of the Brotherhood of all men. ... The development of the psychic powers and faculties, the premonitory symptoms of which are already visible in America, will proceed healthily and normally. Mankind will be saved from the terrible dangers, both mental and bodily, which are inevitable when that unfolding takes place, as it threatens to do, in a hot-bed of selfishness and evil passions. Man's mental and psychic growth will proceed in harmony with his moral improvement.—H. P. Blavatsky, in *The Key to Theosophy*.

What is to Become of our Homes?

IF a modern Rip van Winkle should suddenly appear after his hundred years' sleep, and look over our periodicals, he might reasonably ask himself what is to become of our homes. He would read daily accounts of armies of women who walk the streets, raid the halls of legislatures and hold assemblies and conventions, for the purpose of securing the power of the ballot from those who monopolize it. However misguided these efforts might appear to him, he would perhaps be able to recognize a certain sincerity of purpose among many of these. But on reading further he would discover that large classes make an absolute occupation of social gaities, to the complete neglect of their homes. And further yet—horror of horrors—he would find that the fashionable world abounds in mothers who gamble!!! He might well be excused if he stood aghast, and asked in open-mouthed wonder what was to become of our homes, and with what sort of citizens is our land being peopled?

The long neglect of duties, the utter lack of a sense of responsibility on the part of a large number of mothers, invites one excess after another. And little by little, what was at first regarded with horror, is then tolerated and finally liked.

We might think at first that such customs are only to be found among those whose natures are clearly stamped with evil; but not at all. It is most common in so-called respectable society! It has spread into the churches, and so powerful in some quarters is its hold that some clergymen are afraid to touch it for fear of losing their members. And it is reported of some others—to their eternal shame be it recorded—that they participate, merely suggesting that the winnings be given to the "Cause of God." For this gambling does not take place in a public gambling house—that would be very shocking—but right in the comfortable parlors of our respectable mothers! It is nothing but a simple bridge party, where a little wine (or tea) or brandy is served, and shared by one's respectable friends.

This is the way that many of our mothers find it worth while to pass their time.

And between the assemblies there are serious lessons in whist, given by whist professors—and so the precious moments of life are passed. And the children?

What poison must there be in the air to make such things possible? Certainly the Rāja Yoga system, awakening the divine possibilities in the children, through them touching the mothers, has come none too soon. W.

The Larger View

A CERTAIN forty-acre athletic field in an Eastern city has been for some time a bone of contention between neighboring families, who did not believe its influence to be of the best, and a certain class who wished it kept open, though well knowing that to support it would make it increasingly easy for many to break certain State laws. No one could be found possessing sufficient means to guarantee its continued existence as an undesirable center, nor did anyone rise up out of the class of objectors to it with sufficient money or influence to make objections count.

In the meantime it was becoming a favorite lounging-place for the growing boys of the town, to their manifest detriment.

A wealthy widow, hearing of the conditions, promptly cut the Gordian knot by purchasing the tract, presenting it to the municipal authorities on condition of its being kept, in perpetuity, and under careful supervision by educators to be appointed, as a play-ground and athletic field for school children.

This is of the essence of brotherliness, and the spirit underlying it may manifest in every life, even the poorest; and how very simple is it, too. We do not need money half so much as insight and soul-qualities for the saving of humanity's children. When Pilate and Herod fall out, in fact whenever there is discord and contention anywhere, a gateway is left open in some citadel otherwise secure, and

HELENA PETROVNA BLAVATSKY

if goodness and wisdom do not enter in and take possession, evil certainly will. Those who envy the wealthy for their power to seize such opportunities to serve as the one presented in this case, are those whose eyes are blind to the opportunities their own lives offer.

Oh the utter majesty of the Law! We are given so much more, *so much more*, than we have hands to hold or eyes to perceive. But the day of humanity's awakening is dawning and when it shall have become as much the common view to spend our fortunes, consist they of talents, time, money, effort or only the poured-out sunshine of a courageous, grateful heart, on *others* rather than on ourselves, then heaven will be close within our grasp.

At present, one way of helping a better day to dawn is to accentuate the signs that proclaim its coming, occurrences here and there such as the one noted, even the seemingly trivial ones, for all point to life's larger outlook. There is no lasting peace save in unselfish work for others, and when to unselfishness is added wisdom there is hope indeed. H.

A Needed Philanthropy

THE announcement of a remarkable philanthropy now being undertaken in New York City has just been made. It is remarkable because of the magnitude of the undertaking, the promise it holds of better physical conditions among the "submerged tenth" in all cities (for cities and nations, like communities, classes and groups, are prone to follow leaders), and also because the initiatory spirit is a woman long prominent in the society world, Mrs. Wm. K. Vanderbilt, the elder.

Briefly, the enterprise, which will represent an investment of some millions of dollars, is the building of a group of model tenement houses on eighteen lots already purchased in one of the city's least healthful and most congested districts. The buildings are to consist of three-, four-, and five-room apartments and will, when completed, shelter nearly four-hundred families. They are to be built on a wholly new pattern, by means of which all families will have air, sunlight and warmth, with every convenience and perfect plumbing. They will be offered at a much lower rental than could be the case were they to be built merely as an investment.

But the special need which suggested them was the condition of thousands of sufferers from tuberculosis among the city's poor and the desirability of homes which would make it possible for proper treatment to be given in the home. Homes sanitary enough for that, needless to say, would afford scant hospitality to the invading bacillus in the first place, and thus have an enormous influence in lessening the hold tuberculosis has upon all who are stinted of God's pure sunlight and air—pure, but not always free.

Mrs. Vanderbilt for many years has been interested in the subject of tuberculosis, especially among the deprived and poor, and the clinic established by her in one of the hospitals is among the most important of its kind in the city. She not only regularly visits this clinic but has made it a practice to go with the nurses to the homes of patients and has for some years been considering the problem of the "great white plague" from the standpoint of prevention as well as of cure.

No one who has ever watched the progress of this terrible disease, especially if the victim happened to be some loved one, can fail to see in an enterprise such as this the promise of great good. To extend a helping hand to those who are too burdened, too ignorant, too discouraged to help themselves; to save even a small percentage of the next generation—we are almost too late to save the present generation in respect to tuberculosis—from the doom their ignorance is preparing for them, is to work along lines of progress and with the higher evolutionary forces now so apparent to those who are compassionate in the broad and deeper sense.

There is such a simplicity in methods like the one outlined above. Why should the wealthy not find the real happiness of life in helping those less fortunate? It would seem to be the only rational way of living, the way marked by joy and a clear conscience, by compassion, rest and contentment, for it is the pathway of the Soul. STUDENT

OUR YOUNG FOLK

OPEN THE DOOR OF YOUR HEART

OPEN the door of your heart, my lad,
To the angels of love and truth;
When the world is full of unnumbered joys,
In the beautiful dawn of youth.
Casting aside all things that mar,
Saying to wrong, "Depart!"
To the voices of hope that are calling you
Open the door of your heart.

Open the door of your heart, my lass,
To the things that shall abide,
To the holy thoughts that lift your soul
Like the stars at eventide.
All of the fadeless flowers that bloom
In the realms of song and art
Are yours, if you will only give them room,
Open the door of your heart.

Edward Everett Hale

The Right Time

HAVE you ever observed the peculiar something that attends the right time for doing things? We read in the Bible that there is a season for everything: a time to sing and a time to dance; a time to speak and a time to be silent; but are we quite alive to the veritable magic of "the right time" in what we are often pleased to call the common affairs of life? We should not blunder so clumsily through our days if we were more in tune with this profound and universal law of seasonableness.

All must have had this experience: there is something you wish to do, which in the nature of things ought to be done, but it seems as unapproachable as the Princess behind the thorn hedge. Time passes and there is no possible chance for you to get at it and any effort toward that end is effectively blocked. You do not let go of the intent, but pigeon-hole it, so to speak, and wait.

Suddenly at quite an unexpected moment the way is clear; obstacles vanish as if by magic; all things conspire to help you and it seems as if the conscious force of the universe were directed toward the accomplishment of that one thing. You are almost compelled to effect its culmination.

The thing is done. You stand amazed with what ease and expedition, when you anticipated difficulty and tediousness. Perhaps just then you happen to be less asleep than commonly and you are conscious that there is something a bit unusual in the occurrence and stop to wonder what was at work. What was at work? The Law, to be sure. For once you were in a sufficiently balanced condition to be in swing with the "destiny that shapes our ends," and received its beneficent aid. It was *the right time*, the magic moment, and all things worked together for good.

It is borne in on one that so might we live perpetually, if we could ever learn to trust the inner guide. For if we observe at all, it is well-known that there is always a feeling goes with each thought; in truth it is unerring, and we might always know with certitude whether

Lomaland Photo. and Engraving Dept.

THE ESQUIMAUX DOG

or not it is the right and proper time for any performance. But more often than not, we let the brain-mind pass judgment upon the feeling we dare not trust, and behold the result of the judgment in all our common life — folly, failures, discord, and blunders unending!

STUDENT

"Music Hath Charms"

BEAUTIFUL music has a sublime and wondrous power to lift us up to higher realms of thought and feeling, and there are few persons so utterly depraved that they cannot be stirred to nobler impulses through its beneficent and inspiring influence.

The following anecdote shows how, through the magic of song, the higher nature of some lower types of human beings was awakened.

Manuel Garcia, who was one of the greatest singing teachers the world has ever known, had been with his family on a concert trip to Mexico, and while returning to Europe was encountered by a band of the robbers who at that time infested the mountain region through which he had to pass en route to the coast. Garcia carried with him in pieces of gold and silver all his hard earned savings amounting to about a hundred thousand dollars, and the cruel outlaws not only dispossessed the distinguished artist of his worldly riches but the leader of the brigands, knowing Garcia to be a musician, bound him to a tree and demanded that he display his artistic skill before them or meet instant death.

At first Garcia stoutly declined to grant this strange request; but finally deeming it wiser to do so, he made an attempt to sing an aria in spite of his wretched condition. He was so angered at the treatment he had received however, that he was unable to control his

voice and broke down in the midst of his song, which caused the rude listeners to hiss. This hurt the great musician's feelings, and summoning his self-control he put forth his best efforts, singing with such superb dignity and depth of expression that his auditors were struck with admiration and their hearts were so touched that they restored to Garcia most of the fortune they had taken from him besides escorting him and his family through the remainder of that dangerous district as a protection from other robbers.

If, as the above illustrates, "Music hath charms to soothe the savage breast," how much more potent must its influence be to ennoble and enrich the lives of dear aspiring boys and girls! All young people should cultivate a love for and a knowledge of music; for as Katherine Tingley says, "Music is not only one of the refinements of life, but part of life itself." J.

The Three Truths

THE soul of man is immortal, and its future is the future of a thing whose growth and splendor has no limit.

"The principle which gives life dwells in us, and without us, is undying and eternally beneficent, is not heard or seen or smelt, but is perceived by the man who desires perception.

"Each man is his own absolute lawgiver; the dispenser of glory or gloom to himself; the decreer of his life, his reward, his punishment." — *Idyll of the White Lotus*

He who is false to present duty breaks a thread in the loom, and will find the flaw when he may have forgotten the cause.

THE CHILDREN'S HOUR

The Story of a Bell

HANS ANDERSEN tells us the story of a bell that hung high in an old church tower in the little German town of Marbach. For centuries it had hung there and had rung at christenings, at weddings and at burials; it rang to tell of feasts and rejoicings, or to spread the alarm of danger.

One November night, in a humble cottage, a child was born just as the bell sent its deep rich tones out on the cold air, filling the mother's heart with a great joy and faith.

The little child was given the name of Johann Christoph Friedrich Schiller, and when he grew old enough to understand, his mother used to tell him stories of the bell and how its great mellow tones had always brought peace and comfort to her heart in times of grief and trial.

The boy grew to love the bell as though it were a living thing, and although he moved away from the village with his parents, the bell still rang in his heart always, rang encouragement and hope.

And the boy grew up, and his life was full of poverty and struggle, strivings and suffering and exile; but there was something great in his heart that could not be crushed. And as the old bell had sung out to the heavens and cheered all those struggling below, so Schiller one day sang his whole heart out. He sang of the heaven-inspired Maid of Orleans, and of William Tell, the liberator of Switzerland, and of all things great and glorious; and one of the most beautiful of his songs was called *The Lay of the Bell*.

Years passed. The old bell of Marbach had long since fallen from its belfry and lay cracked and neglected in the church yard. Finally it was carted away and sold for old metal. Then one day there was talk of melting it and using it in the memorial statue to be erected to Germany's immortal poet, Schiller.

Then came the task of finding an artist great and worthy enough to be entrusted with the honor. The choice fell on Thorwaldsen of Denmark. He, like Schiller, had been born in poverty but had become the pride of his country; for he could hew marble blocks into such glorious shapes that it made the whole world wonder.

Thorwaldsen fashioned a mold of clay and the molten metal was poured into it. The old bell that Schiller as a lad had loved, flowed

TWO FRIENDS IN THE GARDEN OF THE RAJA YOGA ACADEMY, LOMALAND

PINE NEEDLES

IF Mother Nature patches the leaves of trees and vines,
I'm sure she does her darning with the needles
of the pines,
They are so long and slender; and somewhere in
full view,
She has her threads of cobweb, and a thimble
made of dew.

Paul Hamilton Hayne

into the mold to form the head and bust of the statue.

Then came the unveiling of the statue. Flags waved from the roofs and steeples of the royal city of Stuttgart; bells rang for joy and festivity. One bell alone was silent but it gleamed from the head and breast of the unveiled statue of Johann Christoph Friedrich Schiller.

L.

In the Garden

ONE day a tiny ant all alone on the wide sandy road in the garden was trying to carry a piece of wood three times its own size. The little lone ant in the big sandy desert looked the way you might feel if you were suddenly put all by yourself in the middle of the ocean; oh, so lonesome!

But do you think the ant stopped to think how he felt? No, indeed! Not a moment was to be lost. The ant had *work* to do. He tugged at his huge burden and shoved it along, then back it tumbled and he had to begin again.

But he was not discouraged. He had a *purpose*. There was no time to sit down and complain. When he could not move his bur-

den from one end he ran round and tried the other end, and then ran away from it to get a good view and see which part to move next. So he kept at it, and at it, until it made you feel strong to see so much determination.

After an hour of hard work he had moved it about twelve inches, but do you think he stopped to measure the distance or to look ahead at the long, long way that lay before him? Not a bit of it! That little lone ant simply kept *going on*.

At last there came hurrying and scurrying across the great road desert another ant. How fast he came! Nearer and nearer to the hard-struggling ant he came, until, with a dash, he seized the other end of the huge burden and it rose in the air like a kite, with the two ants

underneath pulling together like one string; and away they went, huge burden, ants, and all, skimming across the great road desert like a ship sailing over the sea.

Now, how did those ants know so much about Brotherhood?

How did the lonely little ant know that all he had to do was to—well, just to *do*, without questioning or fear, the duty before him, and the great Law would send help if needed?

And when the little helper came, he did not stop to tell why he had come, nor did the lonely ant sit down to tell the little helper what a hard time he had had. That would not be Brotherhood. The ants put all their attention on *doing the work together*, and kept *silent* so the great Law could help them.

How do ants know this Brotherhood secret? It is the same secret that gives human Brotherhood workers the power to help to lift the world's huge burdens, the wonderful secret of trust in the Law.

E. W.

A New Duty for a Spaniel

YOU have heard of dogs who are very clever at minding sheep but did you ever hear of one who helped to keep order in school? A teacher in Washington has a black cocker spaniel who goes every day with her to her school in a part of the town where there are so many people that there is not room for them to keep dogs in their homes. Hector loves the school children, and they love him, and when he barks at them to make them stop whispering, they obey. When they spell D-o-g, he wags his tail.

THE MYSTERIES OF THE HEART DOCTRINE

PREPARED BY
KATHERINE TINGLEY
AND HER PUPILS

The Theosophical Book *of the* Twentieth Century

Tells the story and the history of the Theosophical Movement.

The prices are \$2 in cloth and \$1 in paper, which barely cover the cost, for it is printed and bound, not gaudily, but with such carefulness and thoroughness of art and craft as to make it unique among modern edition books.

ORDER FROM THE
THEOSOPHICAL PUBLISHING CO., POINT LOMA, CAL.

Over-Anxiety about Personal Dues

worldly concerns might be expected to behave a little better in their religious speculations.

But how often we find that this is not the case and that people show a meanness on religious questions which they would scorn to show in mundane affairs.

The justice of God, or Destiny, or Karma, is criticised and caviled about in a very sordid and calculating spirit, with an insistence on the fact and value of our own precious personality, and a forgetfulness of the existence of anybody else, that would seem very mean in the relations of ordinary life.

Let us imagine a household in which every person insisted on being treated with the most rigid justice and demanded that the manager should give everybody exactly the same amount of food, making a disturbance and accusing him of partiality if he failed in the slightest degree in this respect. Would it not be a family of pigs! In actual life everyone is willing to give and take and no one is upset if he happens to get a little less than his due on some occasions, for he

knows that his companions are getting a little more and that the community as a whole is getting its dues. We do not cavil about little inequalities or insist on exact and rigid personal "justice" being meted out to each. In friendship and comradeship—in every relation where there is a fellow-feeling and a sense of the common life—the law of give-and-take is recognized. Where there is a proper spirit people do not think at all about the commercial justice of the business or go to balancing up accounts of indebtedness and bartering favors. They just take what comes, and give and receive without troubling about how the account balances. But this is putting it at a low estimate; for decent people are happy to give more than they take and to bear a little more than in strict equity they need to.

All this is familiar enough, and means that we are actually a good deal better than some of our religious views would lead one to think.

Solidarity is the Law of Life

is the primary law of life, and we all recognize and follow it. We may imagine that our personalities are separate, but we act all the time as if we knew that they were not. Our personalities are separate like the branches of one tree; they are separate in one sense, but not so in another.

But in religion we speak as if we had entirely separate Souls. Even in explaining the

law of Karma, Theosophists often lend themselves to this trait of religious selfishness in humanity and dwell too much on the personal aspect of the question. Without doubt the great Law adjusts all things equitably and impartially, giving to all their due and giving each the harvest he has sown. Yet it is unseen to be over-anxious about our own exact dues; for, by being so, do we not bind ourselves down to the region of personalism? We should always bear in mind that the more we become conscious of our non-separateness, the less we shall be concerned about our personal dues. Theosophy teaches, before all things, that separateness belongs only to the external and non-essential part of man's nature, while his essential life and consciousness is non-separate; and it urges him to endeavor to reach up to this plane in his nature. If he can succeed in doing that, surely he will cease to trouble about his personal balance-sheet and will be willing to leave the care of that to the Law of cause and effect.

Both sides of the question must be carefully kept in mind. The Law cares for the lily and the sparrow—even for the smallest atom; perfect justice is done to all. On the other hand we all look forward to a resurrection from the plane of personality into a larger life wherein we shall feel our solidarity. And whenever we think deeply on this aspect of the question, our personality begins to lose its importance and to wane into insignificance; we feel more willing to dismiss concern about its supposed rights and to accept whatever we may chance to encounter in the course of our duties and aspirations.

Again, we should think of ourselves more as independent responsible divine beings, endowed with aspirations and will; and less as dependants expecting favors from God or Fate. We have this same contrast in connexion with industrialism. On the one hand there is the true craftsman whose pride is in his work; on the other the mere hireling who is concerned only about his hours and his wages. The one is a man, the other a machine. So the religious person is too often a machine. Instead of feeling that he is Somebody and can do things, he assumes a dependent and expectant attitude, always readier to blame fate than to help himself.

Let us apply this to the question of Karma. In what respect is the man who lies inert and worries about his Karma any better than the fatalist or the religious craven petitioning his God? Would it not be better to act and leave Karma to take care of itself? Supposing we are suffering a hard lot; is not the main thing

No. 33

KATHERINE TINGLEY AND POINT LOMA

From the *Newburgport Daily News*, May 29, 1909

MRS. KATHERINE TINGLEY, Leader and Official Head of the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY throughout the world, returned to her summer residence, 201 High Street, this city, last Tuesday. She brought with her as her guest, Mrs. Walter T. Hanson of Macon, Ga., wife of the president of the Bibb Manufacturing Company in the South; her secretary, Iverson Harris, Jr., and her maid. Mrs. Tingley has refused interviews to all newspaper representatives in their inquiries about a recent attack upon her and her work in Cuba. Her American and Cuban attorneys have exacted this. A reporter of

national headquarters, where the business of the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY is carried on, and where teachings of theosophy are demonstrated in practical education to young and old.

"It should be borne in mind," said Mr. Harris, "that the organization represents no particular creed, that it is entirely unsectarian. It includes men and women from all stations in life, and it exacts from each member that large toleration for the beliefs of others which each one demands for himself.

"It should be remembered that Mrs. Tingley had

ences of great achievements for the betterment of humanity. This has impressed thousands of thinking people from all parts of the world.

"In spite of no end of obstacles, Mrs. Tingley has proven what Theosophy can accomplish as an uplifting force in human life.

"There is nothing sentimental or uncanny about the practical work at Point Loma—the whole tone of the activities there is worthy the beauty of the place.

Dignity, Grandeur, Uplift and Poetry, characterize the peculiar beauty of Lomaland; every department is graced with aspiration and common

POINT LOMA, CALIFORNIA

the *News*, who was unable to gain an interview with Mrs. Tingley, succeeded in meeting one of her secretaries, Iverson Harris, Jr., who is a student at the Râja Yoga College, Point Loma, California. He is temporarily assisting Mrs. Tingley while visiting the East.

Mr. Harris said that as acting secretary for Mrs. Tingley, it would be impossible for him to give many interesting facts connected with recent events, but there were some he was at liberty to publish. He called attention to Mrs. Tingley's international work and declared that it was not an experiment; that it was a pronounced success, so acknowledged by some of the highest educational authorities, east and west.

He said, "The Theosophical Institutions at Point Loma are not a colony or community, but the Inter-

her choice of what path she should follow in life; that she was not compelled to devote her money and time to suffering humanity; but she has done it, and has had her persecution all these years.

"It is a fact beyond question that Mrs. Tingley's most subtle enemies have succeeded through yellow journalism in impressing a certain class of ignorant minds with the idea that the Point Loma Institutions constitute a very mysterious and uncanny community which is shut in from the world, where all sorts of erratic teachings are carried out.

"We must remember the old saying that 'a lie two hours ahead of the truth can never be overtaken.'

"Katherine Tingley began her work at Point Loma, about 10 years ago, and she has filled the vast area of hundreds of acres there with the evid-

sense—the antithesis of selfishness and ignorance.

"Katherine Tingley's work in upbuilding the home life has been a great task. You see, Theosophy views the home as the only place where national regeneration can be brought about. Mrs. Tingley declares that 'home is the place where high conditions must be established, whence all impure elements must be rigorously excluded, if the new generation is to redeem or preserve our civilization from the perils that threaten it. Marriage must be considered more sacredly, and children must be taught in early life the potency of their divine natures.' The home-life at Point Loma Katherine Tingley has built upon the knowledge of these facts.

"In the words of one of America's greatest writers, 'every boy at the Point Loma Institution is a gentleman, every girl a great lady, yet these young

folks retain all the spontaneity and charm of childhood.'

"The personal attention that Mrs. Tingley gives to the advancement of art, music and drama, at her Conservatory at Point Loma, and in her writings and lectures, has had a wide-spread influence.

"Then there are the industrial departments, which include the arts and crafts, domestic economy, etc., the forestry department, the photo-engraving department, and a finely equipped chemical laboratory—established and conducted by her. The Aryan Press at Point Loma, which turns out some of the finest work of any printing press on the coast, is another feature of Mrs. Tingley's practical work.

"Besides these departments are her academy and

Montauk, Long Island, N. Y., where the United States government had established a large hospital camp.

"Mrs. Tingley lost no time in turning the energies of her workers in the direction of this place, where she set up a number of large hospital tents and equipped them with the supplies which she had collected for Cuba.

"General Wheeler was then officially in charge of the camp and after the work was closed at Montauk he brought to the attention of President McKinley a most favorable report of the great work Mrs. Tingley and her staff had accomplished in caring for the sick at that time, when so many brave soldiers were ill and needed help.

schools. The students there are from many different countries, representing America, England, Germany, France, Ireland, Sweden, Finland, Hungary, Greece, Japan, Spain and Cuba.

"Many people have questioned why Mrs. Tingley spent so much time and money in Cuba, evidently in preference to other countries. Her answer has been that 'Cuba, because of its long persecution, and bitter suffering in the recent war, needed help more than other countries did.'

"How Mrs. Tingley first became interested in Cuba is a very interesting story. Her sympathies were aroused from the daily reports that she read in the American papers of Weyler's persecution of the women and children on that island. Her interest became so great that she called upon the members of her society from all parts of America to forward supplies to help these suffering people to the New York office, where she at that time had her headquarters.

"As she was about to start for Cuba, with physicians and workers,

The Spaniards were Defeated, and Peace was Declared,

and shortly after the United States transports carried sick and dying American soldiers from Cuba to

that the food she was so generously about to give them was the devil's food; and it is a fact," said Mr. Harris, "the poor souls actually refrained from eating a mouthful on account of the fear that had come upon them through the efforts of some of Katherine Tingley's enemies. If one wishes to know the magnitude of Mrs. Tingley's work at that time one should hear what the hundreds of Cubans have to say about her.

"Many children, made orphans by the war, slept in the parks and on verandahs of deserted hotels. It was the condition of the

Suffering Children in Cuba that Aroused Katherine Tingley

to send a staff of workers later to Cuba, and to take a certain number—about 40—to Point Loma to be cared for and educated.

"These children were from all classes, some were orphans, others half orphans. Not more than four had fathers living, and the parents of all, at that time, were in the most destitute circumstances, owing to the havoc of the war.

"Quite a number belonged to some of the best families on the island; others were from the middle class, and a very few were from the very worst environments.

"It might be mentioned here that most of the annoyances that Mrs. Tingley has had in Cuba, have come from this class, who have been educated in superstition and are easily influenced in the wrong way by those who should be their protectors, to injure Mrs. Tingley."

Mr. Harris referred to some uncanny and absolutely false statements recently published in a paper in this city. He said that Cuba had its superstitions, and that he believed that New England was not yet free from the same influence. "It must be so," said Mr. Harris, "if any of the readers of the Newburyport paper I referred to have accepted some of the absurd statements made in it; such as these." Mr. Harris then almost laughed himself into convulsions when he referred to them, and said: "Is it possible that any sane person could believe such stuff? That Mrs. Tingley included in her teachings the transmigration of souls, that the souls of the dead return and enter into animals; and then that Mrs. Tingley remembered Madame Blavatsky thousands of years ago?

"These unwarrantable and absurd stories were not originated by the writer of the article which contained these statements; nor did they come from idle gossip; but they are part of a scheme started long ago to discredit Mrs. Tingley and her work, and to frighten people who are inclined to investigate Theosophy.

"Why! the persecution of the Middle Ages is not in it. The history of the way Dreyfus was hunted down and imprisoned is but school-boy trickery in comparison to the attacks against Mrs. Tingley. During this time

Two Attempts Have Been Made on Mrs. Tingley's Life.

"One was just before she began her libel suit against the proprietor of a newspaper in Los Angeles. She was in her box at her theater in San Diego, watching the performance of some of the Râja Yoga children, who were giving an entertainment there. The man who attempted her life was caught by the policeman just as he pushed his hand in between the curtains. He was arrested.

"Mrs. Tingley being at that time under great pressure in preparation for the trial which she had demanded, accepted the statement of the man's friends that he was insane, and he was sent back to another state, with the understanding that if found in San Diego again, he would be re-arrested. There was no question in the minds of Mrs. Tingley's friends that this man was feigning insanity.

"The other attempt was even more dangerous.

"I can assure you that when Katherine Tingley's book, 'The Conspiracy against the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY and its Lead-

ers' is published, it will prove a revelation. It will show what the vicious can do in the name of religion, politics and morality in our 20th century.

"It is quite natural that one should ask 'Why should the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY and Mrs. Tingley be attacked?' Well, the fact is, that it is a menace to all systems that are not based on right action and unselfish effort for humanity. Then there is the fact that all the officers of this Society are unsalaried.

"As far back as thirteen years ago, when Mrs. Tingley succeeded William Q. Judge to the leadership of the organization of which she is now the head, she was attacked and outrageously misrepresented in many countries, and particularly in India, by the representatives of a small faction there that calls itself Theosophical.

"Mrs. Tingley was on her tour around the world, and in all her public lectures she clearly defined to her audiences the difference between the Theosophical Society which she represented and the society which called itself Theosophical, headed by a Mrs. Annie Besant, which was in her opinion, teaching unwholesome doctrines.

"She declared then that it was an injustice to the public and to truth for the teachings of Mrs. Besant's repudiated society to be associated with the pure Theosophy which Madame Blavatsky had brought to the western world. Since that time," said Mr. Harris, "Mrs. Tingley has been justified in her action, for the repudiated society has been split in twain lately, on account of the immoral teachings and alleged practices of one of its principal lecturers, a Mr. Leadbeater. And right here, I would like to say that I am almost sure that Mr. Withington, of this city, who recently published his knowledge of Theosophy, gained from a 'Theosophical' lecturer,

Got His Information from the Man Referred To.

"Ever after, some prominent members of the repudiated society have been active in circulating slanders against Mrs. Tingley. These were as absurd and untruthful as the hundreds of others which have been poured out to the public through the yellow journals of America and other countries.

"Some statements, grossly libelous, have gone the rounds in this country in a private way. The principal factor in directing this was a member of Mrs. Besant's society, who has since been proven insane according to the statement of a reputable physician in New Orleans, who declares that he treated this man for insanity for about four years.

"This old man's work accentuated itself in a special form, which marked him a monomaniac. In

the private circular sent out by him to clergymen, editors, and members of Mrs. Tingley's society, this deluded creature introduced himself as a hypnotist; as one who had visions and directions. He said he had a mission. This mission he carried out with the idea of driving Mrs. Tingley from her official position and placing Mrs. Besant in her stead—Mrs. Besant of the repudiated society.

"When the poor, self-deluded old man found that his work had not the desired effect, he then with other persons connected with the repudiated society was the means of certain ecclesiastics in the town of San Diego receiving their budget; and at about the same time, a very erratic missionary in Santiago de Cuba had his supply, which he used vigorously to frighten the parents of Cuban children, who were interested in the school at Point Loma.

"You see this poor apology of a Christian missionary had a pay-school in Santiago, and it was a well-known fact that it could not prosper if Mrs. Tingley's work continued in Cuba as it has done, for then she had two large schools there.

"Later, Elbridge Gerry, who took such an active part in interfering with eleven Cuban children on their way to Point Loma, felt himself sufficiently fortified with the same malicious matter to stimulate the wealthy patrons of his society to increased donations by posing as the great humanitarian, and as being determined to rescue these Cuban children from

'That Dreadful Society at Point Loma.'

"All who followed the publications in reference to this attack will remember that Mr. Gerry was defeated by Katherine Tingley, and the children went to Point Loma. Most of them are there now, well, and happy.

"When Mr. Gerry started this attack, Mrs. Tingley appealed to the United States government, and demanded an investigation. Commissioner Sargent, head of the bureau of immigration, at Washington, was sent to investigate. The report that Mr. Sargent carried back to Washington was not only favorable, but he said that if he were living nearer to the school, he would place his own child there.

"One of the urging factors behind Mr. Gerry's unchristian attack was the monomaniac—the crazed

Lomaland Photo. and Engraving Dept.

PHOTOGRAPH, TAKEN MAY 15TH 1909, OF ALL CUBAN BOYS FROM SANTIAGO DE CUBA, NOW ATTENDING THE RÂJA YOGA SCHOOL AT POINT LOMA, CALIFORNIA. THIS GROUP SHOWS (AFTER 8 YEARS AT POINT LOMA) SEVEN OF THOSE WHO CAME IN 1901

old man referred to. Another was a clergyman who had formerly had a church in San Diego, but who had shortly before the Gerry event resigned from his church, as he had been informed that he would be asked to do so. The chief reason of his resignation, it was said, was that he had caused much disturbance in the city and in the church through an unwarrantable attack upon Mrs. Tingley.

"At the time of the Gerry attack Mrs. Tingley was held in San Diego, California, as her suit against Harrison Gray Otis, proprietor of the *Los Angeles Times*, for libelous statements, was about to open.

"Among the libelous statements made by his paper was that of the starvation of children at Point Loma, and other outrageous stuff. Mrs. Tingley won her suit against Mr. Otis and recovered heavy damages. The judge's charge to the jury was: 'I declare to you as a matter of law that there is no legal proof of the truth of that charge, and therefore you must regard it as false.' The Judge further said: 'The publication in all respects in which it is construed by the complaint, is in law, libelous.'

"Mr. Otis appealed to the Supreme Court of California for a new trial. The Supreme Court gave Mrs. Tingley a final victory by affirming the decisions of the lower court, notwithstanding eight hundred or more objections were entered by Mr. Otis and attorneys.

"Some time after there was another attack, in which many of the former scandals were revived. It was started by a man in Chicago, whose wife was a member of Mrs. Tingley's organization. He professed to be bitterly opposed to Theosophy and would not allow the mother of his two children to read them the simple story of 'The Child Life of Jesus.' Later, he suddenly turned about, and to his wife's surprise, proposed that she go with the children to Point Loma, while he was away on a business trip to Honolulu.

"The wife, unacquainted with his real plan, carried out his wishes and the husband applied to Mrs. Tingley for his children to remain in the school during his three months' absence.

"Mrs. Tingley, who had for a long time been acquainted with his home conditions and his methods, refused to accept the children in the Rāja Yoga school, but allowed them to remain with their mother, in the residential part of the institution, and the husband went on his way, supposedly to Honolulu. The next day he endeavored to kidnap the two children, making no effort to take his wife with him. The frantic mother defeated his plan, and the disappointed man returned to San Diego and secured a writ of habeas corpus in which he declared that Mrs. Tingley was holding his children. Mrs. Tingley immediately went to the court in San Diego to meet the accusation, and when she appeared in court

The Case was Abandoned by the Opponent.

"Several months afterwards this man succeeded, through the courts in Los Angeles—Mr. Otis' town—in taking the children away from their mother and carrying them to their former home in Chicago.

"The mother would have followed and begun a suit there for the custody of her children, but her friends informed her that there was a plan to place her in the insane asylum. She sued her husband for divorce in the state of California, on the grounds of adultery, and she named as co-respondent her mother.

"A link in the chain of events is that this mother, a practising physician, applied to Mrs. Tingley several years before for a position with her staff of physicians who were going to Cuba, and after Mrs. Tingley had made certain inquiries, she informed the lady physician that there was no position for her.

"Here follows another attack some years afterwards, in which the same old accusations were rehearsed by an obscure member of Mrs. Tingley's society, whom she had expelled on account of his brutal treatment to his sick wife. In the Courts of San Diego, California, his wife afterwards secured

a divorce and the custody of her children on the grounds of brutal treatment.

"This man began by making attempts to see his child, who was at the Rāja Yoga Academy. This was contrary to what the courts had arranged, and as the child was in the custody of the mother, Mrs. Tingley refused him admittance to the grounds.

"Later he appealed to the Superior Court of San Diego, to have his child taken out of the institution, declaring that it was not properly fed, etc. The child, rosy and healthy, was brought into court, and the father lost his case. The child is still at Point Loma receiving support and education at the expense of the Rāja Yoga school there.

"If one reads carefully the history of the attacks on Mrs. Tingley, one can see the trail of the monomaniac's malicious work all through other attacks, taken up by enemies of hers in different countries to further their selfish schemes.

"The erratic Besantite who has been so active against Mrs. Tingley later cleverly introduced in the construction of his malicious statement that of an ex-clergyman in New York, who had been a failure in his church in Brooklyn, an unsuccessful canvasser and politician, and later was a teacher of hypnotism, living on his wits.

"This man was the husband of a woman Mrs. Tingley had formerly employed; and he had, on several occasions, at about the time she was becoming known as the leader of the Theosophical Society, attempted to blackmail her. During Mrs. Tingley's absence, on her first trip around the world, he was very hard up, and in order to build up his business in the minds of the public, he published in his advertisements that Mrs. Tingley was formerly a pupil of his in hypnotism.

"The only foundation he had to substantiate his story was that she attended one of his public exhibitions with some friends, who had become interested in hypnotism, and to whom she was trying to point out the danger of that practice.

"Mrs. Tingley has given many published lectures and written much against hypnotism.

"One of the most wicked scandals that was circulated a few years ago was that Mrs. Tingley's husband was seeking a divorce from her; and that a young man with whom she was associated would be named as co-respondent. Here are the facts against that damnable accusation. Mrs. Tingley had come to her home town and taken her youngest brother to New York to assist him in recovering his health. In order that she might have for him special treatment with a noted physician there, she took apartments in New York city and for several months

Devoted Himself to this Beloved Brother.

The co-respondent referred to, was the brother.

"These horrible stories I am telling you are only a few among the many that are constantly rehearsed by Mrs. Tingley's hidden enemies; so you can readily see that the few who are carrying on active work against her in Cuba through a small gutter-sheet of three months' life feel themselves well-equipped to rehash old scandals and thus serve those who have employed them.

"The recent attack attracted Mrs. Tingley's attention through a feverish letter written some months ago by a seemingly alarmed mother—a colored woman—about her daughter who was at the Rāja Yoga school, at Point Loma.

"For eight years this poor mother had sung her gratitude in letters to Mrs. Tingley for the splendid care that had been given her daughters at the Rāja Yoga school at Point Loma.

"Mrs. Tingley, realizing the inability of the sick mother to support her children, and her undesirable surroundings, has had the two girls given special attention in general industries that they might become self-supporting in Cuba. Among these was the domestic economy department. Both girls went to Point Loma with an inherited disease. One regained her health and kept up in her school studies.

She excelled in general deportment. The other, of an opposite temperament, looked upon work as degrading—study, not necessary.

"Her health could not improve when she showed no disposition to take the doctor's medicine or to follow the course of diet prescribed, notably during the last two years, and recently, at a time when she most needed constant care and nursing, her mother, under the influence of the small coterie of enemies in Cuba, insisted on her return. In spite of her being considered too ill to travel, Mrs. Tingley was obliged to return her, as the Cuban laws are very exacting.

"Mrs. Tingley paid the expenses of the girl and a nurse to Havana. It is quite evident from what has transpired since, in connexion with the attack, that this girl had been selected as the one

Who was to be Used to Attack the Institution.

"If Mrs. Tingley's duties had permitted her, she would have gone to Cuba and would have taken legal action to protect the innocence of the girl against the environment that she had been forced into. The Cuban law provides that the parents have full control of their children until they are 23 years of age. In order to show the incompetency of a mother as to moral rectitude, etc., there must be evidence through witnesses unattainable, yet the moral reputation of the parent may be well known.

"The sister of the sick girl who went to Cuba has made a statement to the Cuban government of the absolute falseness of the statements published in the Santiago sheet as coming from her sick sister.

"Shortly after Mrs. Tingley first arrived in Newburyport, where she intends to spend the summer, entertain friends, and her teachers from Cuba, she was cabled of the attack in Santiago, and on May 6 she telegraphed a demand for the Cuban government to immediately investigate her schools at Point Loma. As soon as the editor of the small sheet referred to, in Cuba, learned of Mrs. Tingley's action, he then applied to the Cuban authorities to have the school investigated, thinking it would obscure Mrs. Tingley's efforts to the public.

"As soon as the Cuban minister, Señor Carlos García Vélaz, whom Mrs. Tingley interviewed at Washington, responded to her demand and sent Chancellor Barranco of the Cuban Legation to Point Loma to investigate, the baffled enemy turned about and called for the Cuban government not to investigate Point Loma, but to come to Santiago, where the victims were!

"The victims referred to consist of the poor sick colored girl, who in her weak and dying condition is an easy instrument in the hands of the unprincipled; the other is an incorrigible Cuban boy, sent back by Mrs. Tingley to Cuba, who was too lazy to study, and who Mrs. Tingley felt should try to support his poor sick mother.

"The boy, not returning with a good report, became an easy prey to the enemy.

"Since the attack, many of Mrs. Tingley's influential friends, including governors, mayors, a senator and other influential people in Cuba have begged her to permit them to make a public protest.

"Mrs. Tingley's answer was that they would please wait. You see, she is giving her enemies every opportunity to commit themselves, and I should not feel at liberty to say what I have said, in reference to this last attack, if the curtain that has hidden this nefarious work was not soon to be lifted, when we may find old American enemies have had a hand in present attacks.

"When approached by newspaper representatives in Washington, New York and Boston, I have refused to give them any information in reference to the recent matter; but since my return from Washington with Mrs. Tingley, I have felt that the fair-minded citizens of Katherine Tingley's hometown, even if they did not know her, would be glad to know the true inwardness of some of the attacks that have been made upon her, since she has been working for humanity."

to bear it bravely, to refuse to be downed by it, and to turn it into good? Does it so much matter how or why we incurred it? If we but think of our real Self behind the scenes, we shall see that we are heroes, knights, on a self-appointed pilgrimage, on a self-sought quest, encountering dangers willingly, gallantly. This surely is the best attitude to assume towards life, not that of victims being driven reluctantly along.

In view of this brave, manly attitude, the aphorism "With whatsoever measure ye mete, it shall be measured to you again," becomes almost a threat; as though the Deity were like some sham friend, unwilling to become indebted to us, and insisting on instantly returning every favor so as to wipe off the indebtedness. Would a person really anxious to devote or sacrifice himself be pleased if he were offered payment? Would a really gentlemanly God, or a really decent Law, treat us like a lot of jealous children? Does a mother requite affection with money? and shall a God decline to accept services?

In a dreadful arithmetic book there is a sum which says that Tommy receives so many cents a day for cleaning his father's boots! Some people seem to fashion their idea of God or Fate on the model of this father. If the Law were no wiser than this father, we might find ourselves paid in our own coin. But is it not just possible that Divine Wisdom and Divine Love may have something better in store for us?

And now, for a change, let us hear a few complaints about the undeserved good fortune which people have to endure. STUDENT

Hertzian Waves Dangerous to Health

ACCORDING to the *Lancet*, wireless telegraphy must be added to the list of new inventions attended with danger to health. The arc light, the *x*-rays, and the radium emanations have been found dangerous; and now the Hertzian waves have proved to be a menace. A French naval surgeon finds that those members of the ship's company employed in sending wireless messages developed various affections, of which the commonest was a slight conjunctivitis; in one case ceratitis was produced, resulting in a leucoma of the cornea; eczema on the wrist and on the eyelid occurred; and one operator, who had been working for several years, had painful palpitation of the heart, which came on after working for any length of time with the instruments. It is suggested that many cases of "nervousness" and neurasthenia, such as are alleged to be getting rather common among naval men, may be due to the Hertzian waves of wireless telegraphy.

The action of these various etheric vibrations and emanations is subtle and seems to affect the substratum of matter rather than matter itself. Actinic rays produce chemical rather than physical effects, and dissociate molecules. Radium emanations are believed to dissociate even atoms. The *x*-rays act on the human body in a way that suggests the idea that they destroy the subtle inner body — the *Linga sarira* in Theosophy — thus causing the physical atoms to lose their coherence and

fall apart. There also seems to be a direct action on the nervous fluids of the body.

Are not the investigations of science now carrying it towards that stage at which special training and preparation of the operator will become necessary? If so, then we are approaching the conditions of some ancient sciences. Hitherto modern science, though using the senses of man as the instrument by which to make its observations, has paid little if any attention to the developing and perfecting of that instrument. But ancient and Oriental science may be contrasted with modern science in that it aims first and foremost at developing the means of perception. It has always been the belief of this kind of science that the road to knowledge consists in developing and refining the faculties of man. To this end, self-preparation has always been regarded as a necessary preliminary. But our science has so far busied itself only with such investigations as can be carried on without much special preparation. Now, however, we seem to be coming to a point where the physical condition of the operator counts for something. The ordinary man cannot manipulate these subtler forces with impunity. To enable operators to use the Hertzian waves and the *x*-rays habitually with impunity, it would seem as though some special preparation were necessary.

It comes to this — that we cannot proceed indefinitely in the development of our study of external nature without giving some attention to the study of man himself. These finer grades of matter permeate all nature, including the human organism; and the effects which they produce on us are forcing us to recognize the existence of things whose existence we had denied or ignored — as, for instance, the subtle inner or astral body.

STUDENT

A Perpetual-Motion Clock

A PERPETUAL-MOTION clock is described and illustrated in the *English Mechanic*. It is one that was actually constructed in the 18th century by James Cox of Shoe Lane, London; and his diagrams and description are still extant. His clock was placed in his museum; and the strange circumstances of its fate are brought to light in *Travels in China* by John Barrow, 1804, where it is stated that the Dutch embassy from Canton to Peking carried as presents two grand pieces of mechanism from the Cox Museum, one of which was the perpetual clock. But it was discovered that the Chinese Prime Minister had, during the journey, substituted two other clocks, probably intending to reserve the original ones as future presents from himself in order to gain imperial favor. So the clock may be still in China or in some mislaid collection of European loot.

This clock would be ruled out of order as an instance of perpetual motion by strict definition, although it is easily seen that it would run indefinitely. Its motive power was supplied by the movement of mercury in a barometer. The movements of a barometer are perpetual, and it only remained to apply them to the winding up of a clock. This was done by providing mechanism which caused both the upward and downward movements of the mercury to turn a wheel, always in the same direction. As there was much more movement in the mercury than was needed to keep

the clock wound, an arrangement was added by which the mechanism threw itself out of gear whenever the clock was fully wound.

The principle known as that of the conservation of energy states that the energy which proceeds from a machine is (including that wasted in friction, etc.) equal to the energy put into it. If no energy is put into it, the machine cannot continue to do work; and, even if there were no waste from friction, etc., it could at best only continue to run without doing work. But energy can be supplied from some natural source, such as the tides, or, as in this case, the meteorological changes; in these cases we are actually drawing upon the energy of the earth's motions through space, the heat of the sun, etc., and tending to exhaust these. Energy might also be supplied for a virtually indefinite period by the disintegration of atoms, as is believed to happen in the case of radium.

But, inasmuch as we do not know whence proceeds the energy that is found to be latent in the atoms of physical matter, it is arguable that this fund of energy may be perpetually renewable from that unknown source; hence perpetual motion may be discovered — unless of course we limit the definition thereof to cases in which it is impossible *ex-hypothesi*, refusing to accept cases where it is possible as cases in point.

Ancient science may have known, future science may discover, how to draw upon an inexhaustible fund of super-physical energy and thus make a machine which will run indefinitely.

Perpetual motion, the *perpetuum mobile*, with some alchemists, had a symbolical meaning, in addition to its literal sense; just as the search for the elixir of life, the fixation of mercury, and the making of gold, had their literal and also their symbolical meanings. Life is a succession of moods, phases, or states; and the ordinary man, living intensely in these ups and downs, finds no stable center in his life and believes himself tossed by fate or the capricious hand of a deity. The problem for the alchemist was to discover the stable center of life, around which all the changes revolve like spokes around a nave; or, in other words, to find the central source of energy which keeps all moving. The secret of the perpetual motion, then, was the secret of perpetual renewal and balance in nature — the secret of immortality, how to identify one's consciousness with that which perishes not. STUDENT

Tonal Purity in Auditoria

IN *La Nature* are described some interesting experiments, already alluded to in these pages, which have resulted in the canopy of the Concert platform in the Trocadéro, Paris, being draped with a double layer of soft cloth an inch or two apart. It was found that reflecting surfaces at a distance of over 56 feet produced annoying resonances, and from 75 to 112 feet the echoes, due to a retardation of one-tenth second, became inadmissible. Again the knowledge of the ancients is confirmed, for their auditoria were devoid of reflecting surfaces at a distance from the auditor. While the Greeks employed the megaphone idea, there were days further back than those of mighty Karnak's splendor, when other secrets of increasing both purity and volume of vocal or instrumental tones were employed. STUDENT

Some Views on XXth Century Problems

The Army of the Mad

THE insane in New York State now comprise a medium-sized army, 30,000 strong. From time to time we wake up to some considerable evil flourishing in our midst, talk it over, and arrange something for the ending of it. The something represents the survival of the fittest—as we think—of many proffered somethings. But who proffers something for these great State armies of the mad? The causes of insanity are thought to lie too deep for laymen's soundings and are left for the doctors.

If you see a man going along the street talking audibly to himself, you not unjustly regard his sanity as doubtful. But he is not talking to himself; he is listening to "himself" talking. We must put "himself" in quotation marks, for though it is what would be usually said, it does not correspond to fact. He is listening to what his *mind* is saying; and he only differs from the rest of us in that he lets the sayings take voice. Nine out of ten men walking along the street are willing listeners to their own minds, letting their minds say what they choose and exercising the very slightest supervision. They are captives, led by the nose whithersoever their minds like to go. They must be so until they deny the implicit claim of mind and liking to be *self*. In other words they are only mind-conscious and desire-conscious, not properly *self*-conscious.

What is the mind doing? It is eagerly planning something; it is remembering a conversation or scene of yesterday, getting superfluously angry or pleased once more; it is imagining a conversation or scene that might have been and might be; dwelling upon a wrong done or suffered, an insult given or received; planning something. In other cases every sound or sight suggests a few scattered thoughts and memories, or leads to trains of them. If these fail or become wearisome, there is the chaotic newspaper to suggest some more.

It is startling enough to catch a sudden image of ourselves in a large shop mirror; it is still more so to hear one's voice coming back from a phonograph; "can that be *my* voice!" What would it be to see the train of one's own thoughts for a whole day laid out?

Here is the real cause of insanity. For most of us it needs but that the mind shall become a little flightier and a little more determined in its flightiness, to paralyze judgment and selfhood altogether.

If so, we know in what general direction to look for the remedy. But who that actually sees it will know how to apply it? It is education, but a teacher cannot teach what he has not himself learned. The educators are as far from self-consciousness, as nose-led by the mind as their pupils. The child is scheming for a toy; the teacher for an auto. Jimmy is thinking what Johnny said to him yesterday and what he did in return; Professor James is thinking what Professor John said and what he replied. The Professor philosophizes that he has a "transcendental Ego," but he has never learned that the translation of *Ego* is

I, myself. It is the pulpit mistake over again. If I *have* an Ego—surely meaningless words—I *am* but a mind or a set of likings and dislikings, or even a body merely!

Children must be educated to the knowledge of facts; no one questions that. We shall never cure or stay the progress of the insanity of our times until we learn and teach the deepest of all fact—that we are soul-egos; that the apparatus of mind and desire is in our hands for our use and control, having powers and functions which in their present state of license they cannot exercise or we imagine; and that the first athletic exercise to which the child must be led is to wrestle with these until it has subdued them for its service, until the ring is out of *its* nose and in *their* noses. STUDENT

A Lesson from the Stage

A RECENT article in the *Fortnightly Review* has revived the old question, must the actor feel his part, feel the emotion of the situations, or should he merely behave and speak as if he did?

The true actor's consciousness is very much split while he works, though he may not be self-analyst enough to realize that.

Everyone knows that if he asserts something often enough he will come to believe it. The picture corresponding to his words, at first created faintly or with no connexion to the pictures in his memory that actually belong to his past, will finally become vivid, enter among them, and lose all marks of its false origin. So with assertions of emotion. For example the words "I am deadly frightened," if dramatically uttered, will at once awaken a little of that feeling and may finally awaken it in full strength.

How would you know that you were saying them dramatically or merely as if you were announcing that you were going to put your coat on? Only by noting whether they induced the feeling. The actor going over his part in private has to do just that, to note whether his words and gestures do awake in him the feeling they purport to express. He keeps on at them until he has them in such shape that they do. The potentiality of the feeling must of course be there, or no words or acts will evoke it. The feeling-instrument of the poor actor is either poor in strings or refuses to respond to any other feelings than those to which the owner is accustomed in the course of his restrictedly personal life.

So an important point in psychology comes out. The actor at any rate, should have learned that he himself is not his emotions; whilst they play, he can look at them, decide to what point he will let them run, create them and abolish them, all at his will. How would he play his part if in the course of it he let himself be swept away by hate of some other actor or by dread of bankruptcy?

In ordinary language we should say that he is at once under, and not under, the illusion of the piece; at once the subject of, and the critical observer of, the necessary emotion. He dips one pole of his consciousness into the piece; the other pole, himself, remains as

the critic and driver, using whip or rein.

Life has often been compared to stage work; how close is the resemblance, is not so often seen. The soul should play life somewhat as the good actor plays his part. But it creates the part and to some extent the piece. At once standing back, and entering, it should permit and encourage the development of such feeling as adds to life, that of comrades and its own. It should do deeds that will create this feeling. It should recognize that when this play is run there will be others, and others, until the lessons have been learned and that life which is no play and no illusion has been prepared for, till the instrument is tuned, spiritually vital, and incapable of an inharmonious, unbrotherly note. Then it will be able to respond to the thrill of the true life.

But it mistakes the stage feasts for the reality, has little brotherliness for its fellow players and is swept off its feet by the feelings it should control. The feeling of brotherhood is one with spiritual vitality, the mark of its presence. STUDENT

National Churches

EVERY nation a church to itself, its altar, worshipers, and fire; true patriotism as the one religion—is offered us as the picture of the future of the world by Dr. Stanton Coit. In every heart, the highest good of the nation will be the central thought and the motor of conduct, selfishness dissolving and vanishing. This state of heart, this love of service, shall constitute for each man his God, "the Consoler, the Inspirer, the Savior." "The most sublime Reality, the supreme spiritual Power, is the living principle of social righteousness, the ideal will of a community of human beings."

A step or two further can be seen.

First, that this same sentiment will expand itself from the nation to humanity.

And second, that it will lead the man who cultures it into a new consciousness. It will make him aware that "the Consoler, the Inspirer, the Savior" is an actual Presence within him. This is himself, yet so much greater and fuller than what he has hitherto called himself as to have been named by one who had *re-become* at one with it "The Father in Secret," yet who also said "I and the Father are one." Beyond this is the Absolute Essence of which Jesus said nothing because words can tell almost nothing. *Its* cognition comes only with the highest state of soul consciousness.

We are at one with Dr. Coit when he rejects that "individualistic occultism" which teaches that "the source of spiritual vitality is some inward, non-social center of eruptive psychic powers." For the *real* occultism teaches that "the source of spiritual vitality" is reached by the individual in the proportion in which he develops compassion and universal love for humanity. Its very name might be—and sometimes is—given as Compassion. Man must lose and forget himself to find it. And the power "eruptive" from it is the power to serve with ever greater wisdom, scope and accuracy. The "individualistic occultism" leads away from every divine Light. C.

Archaeology Palaeontology Ethnology

Menhir de Saint-Samson

THIS fine menhir, 30 feet high, having been undermined by treasure-seekers is now inclined at an angle of about 45 degrees. The fact of its being perfectly rigid at this angle proves that it extends many feet into the ground. According to popular belief, if it were re-erected, the town of Dinan (about 3 miles distant) would perish by a flood. B.

Wild Guesses About the

Aryan Cradle

WE may call this an intellectual age, but it is really an age in which the intellect has been confined within certain narrow limits, rendering it acute in some degree, but preventing its expansion. Unless higher factors in character are cultivated, the intellect does not even fulfil its own conditions, but is limited by infirmities of temperament. This is well illustrated by the influence of impatience, which causes hasty generalization on an inadequate basis of fact; so that instead of mature judgments, the results of wide and patient scholarship, we have a multitude of hasty and conflicting guesses, each based on the theorist's own little branch of study. To be able to take such a comprehensive and exhaustive view of the facts as is required in order to arrive at a sound conclusion, qualities of character are required which nobody but an advanced student of the higher life would possess; for no one else is sufficiently free from the prejudices that interfere with the due estimation of evidence.

In discussing the problem of the origin of the Aryan race, for example, scholars are limited by their prejudices against Oriental records and chronology, and their desire to reduce everything to conformity with their own conceptions of history.

A professor of archaeology has written a book to show that the cradle of the Aryan race was not in Asia after all, but Europe. We had previously concluded, from a study of dialects and religions, that the cradle must have been in the high plateaus of Central Asia, preferably the Pamirs. But there is no proof of this, we are now told; we have been misled by the narratives of travelers. We are also warned to regard with suspicion the Hindu books on the Vedic religion, especially the *Rig Veda*, which has heretofore been considered of great assistance in the study of the ancient populations of India. A "scientific demonstration" has been given that the early Aryans could never have lived in Asia, but could only have lived in Europe.

Lomaland Photo. and Engraving Dept.

MENHIR DE SAINT-SAMSON, NEAR DINAN, BRITTANY

No doubt some other theorist would just as easily find the cradle in Africa or Australia; what they are all looking for is some savage tribe from which the Aryans are supposed to have "developed." Thus this fetish of the development of civilization from savagery limits their minds and keeps them from discovering the truth. But, if there is one thing more than another which archaeology is now demonstrating, it is that our civilization did not so originate. In fact the most recent discoveries confirm the teachings of Theosophy that civilization has during all the historical period been descending an arc and that our early Aryan ancestors were greater than ourselves. The civilizations which we find scattered at the dawn of our history over the Mediterranean basin and surrounding lands were the scattered fragments of what was once a vast and cultured homogeneous civilization. The Minoans, the Pelasgians, Etruscans, Hittites, Phrygians, Egyptians, Chaldaeans, etc., were all offshoots and each handed down some of the sacred knowledge which gradually degenerated and became lost to the public ken. We have similar indications in the great stone structures left in various parts of the world as enduring relics of the great Science of antiquity.

This great civilization was the beginning of the Fifth Root Race, which inherited its knowledge from the seventh sub-race of the Fourth Root Race — the Atlanteans whose continent sank under the waves. This is the truth that science will have to recognize; but it must first learn to give more credit to the accuracy of the records preserved by older civilizations than its own — those of India, for instance.

Chemical Analysis of Rameses

"WOULDN'T it jar you," if, after lying buried for several thousand years, some chemist should analyse your body and draw up a table of the fatty acids found therein? Yet a chemist, or archaeologist, or chemico-archaeologist, has analysed the fatty matter extracted from Coptic mummies dating from 500 B.C., and found it to consist chiefly of oleic acid; while from Egyptian mummies of the 21st dynasty, 1500 B.C., he obtained quantities of volatile acids of the fatty series in the form of soda salts.

What is man? Today the proud monarch of mighty empires, tomorrow — $C_{18}H_{34}O_2$. Once these Pharaohs were known by their noble lineage and great deeds; now they are known by their place in a chemical series. Pharaohs of the formula $C_4H_8O_2$, volatile Pharaohs, solid Pharaohs, butyric and oleic Pharaohs. Then, if the chemists find any new acids, they could call them Coptic acid, Ramessic acid, etc., etc. And according to the law of rebirth, an old Egyptian might actually analyse his own mummy. E.

Some Modern Arts Known to the Ancients

IN a tomb unearthed near Capua artificial legs were found near some pottery that probably dated from the 4th century B.C.

Among the modern arts known to the ancients must be reckoned that of *sterilizing water*; for Rufus of Ephesus, in a passage which has been quoted in the press, wrote in the first century of our era that the water of all ponds and rivers is bad, except that of the Nile; and that the best water is that which has been boiled in vessels of earthenware, cooled and heated again before drinking. T.

The Trend of Twentieth Century Science

Some Mysteries in Symbolism

THERE are a number of phenomena in the animal world whose origin it seems quite hopeless to explain without the supposition of causative intelligence in nature. How would the hypothesis of blind variation and natural selection deal with this one:

Certain of the hermit crabs carry about with them a sea-anemone. The head and claws of the crab project from his long shell. On the top of the shell, just above its opening, sits the anemone, securely stuck.

For both, the advantages of the combination are obvious. The anemone is carried about to fresh fields and pastures new where foods abound.

On the other hand, the crab is protected from its enemies by the well-armed and dangerous tentacles of the sea-anemone. In the tentacles there are many thousand long, slender, stinging threads, and the fish that would obtain the hermit crab for food must first deal with the stinging anemone.

Professors Jordan and Kellogg, in their *Animal Life*, go on to tell us that

If the sea-anemone be torn away from the shell inhabited by one of these crabs, the crab will wander about carefully seeking for another anemone. When he finds it he struggles to loosen it from its rock or from whatever it may be growing on, and does not rest till he has torn it loose and placed it on his shell.

In early days, before this phenomenon appeared, one can of course imagine an anemone accidentally sticking to a crab's shell instead of to a rock. One can understand that the food problem would be somewhat easier in consequence. In the absence of a working nature-intelligence one now has to suppose that among the offspring of such a crab were some who faintly liked, somehow, to have an anemone sitting up there; and some who were indifferent. But the liking was unconscious and merely consisted in the slightest possible tendency to put themselves in the way of anemones. At last, after infinitely numerous generations this unconscious spark of liking reached the point of active desire, of active discomfort in the absence of an anemone, of connexion of this discomfort with its cause, and of careful and definite administration of the remedy.

That sounds as if it meant something; really however it is but a bit of auto-suggestion made to make a theory credible, or exclude one disliked. What is to be accounted for is the presence of a strong and definite liking, so strong and conscious as to lead to measures to gratify it. But not one of the steps of the development of this liking is really imaginable; for the first steps, in which the liking was so faint as to be quite unconscious, *would not lead to any measures*; and those who had it would have therefore no higher proportion of adherent anemones than those who had it not. Chance would equally prevail in both cases. Individuals with this faint liking would therefore have no better chances of survival than those without it. Natural selection would not conserve them in any higher degree. The highly developed liking of present individuals remains therefore unaccountable—save by

the operation of nature-intelligences presiding over variations and making them from the first marked enough to do good, or piling them up independently of natural selection.

STUDENT

Lost Powers of Nutrition

THE *Lancet* wonders whether chemistry will ever get so far as to synthesize from their elements all that we need as food. We can make sugar and starch; why not fat? We can make ammonias, cyanides; why not albumen at whose root they lie? True the albumens and proteins are not protoplasm, the basis of life; protoplasm is *living* protein.

But how much living stuff enters the ordinary diet? Is not nearly everything cooked and therefore killed? We have found that nuts, because eaten at the end of an already more than ample meal, do not agree, and have nearly discarded them. Fruits, if we touch them at all, are more often cooked than not. Raw milk is not often a part of the adult's diet; still less raw eggs; and neither of them are always desirable. Raw meat we very properly regard as a medical prescription.

Looking farther ahead than the time when the chemists may possibly synthesize all our foods, we can dimly see a time when our own bodies may be able to do that same. They have evolved to their present point through every plane of nature, and must have preserved—however profoundly latent—every power at work on the planes of life below. Every vegetarian is proof that they can still synthesize their own animal protoplasm from vegetable. The plant plane is one of those through which the body has come up. Plants can synthesize their tissues from the elements in soil and air. Is it impossible that in the future evolution of our own bodies we shall recover that power? The close study of fasting men has shown that it is even now not wholly extinct. If it can be awakened—and there would seem to be no reason why after a few generations of absolutely right life it should not be—we may find that there comes with it the power of immensely prolonging the life of the body.

STUDENT

The Green of the Leaf

VARIOUS workers have been doing some interesting study of the relation of chlorophyll—the green coloring matter of leaves—to plant life.

Why is it green? That is, why are leaves green? Because the green ray of sunlight is beneficial to them? It appears on the contrary that it is precisely this ray that the plants make least—if any—use of. Chlorophyll lets the green ray pass through and away, retaining the red, yellow, and blue. But it is particular as to *what* red. Extreme red and infra-red rays, too hot for the plant's good, are let through. Absorption begins with the orange-red, includes the yellow, stops short of the green, and begins again with the blue. The plants have adapted themselves to the conditions; for daylight, either diffused or direct,

has had much of its green absorbed by the atmosphere. Diffused daylight is strong in the blues; direct, in the reds and yellows.

Chlorophyll is not a simple body, nor is it really the full green that it seems to be. The seeming green results from a mixture of two constituents, one of them a greenish blue and the other a yellow. The function of each appears to be the absorption of its complementary in the sunlight, the former absorbing the red or orange-red and the latter the blues. The red rays are powerful stimulators of growth, of the fixation of carbon from the carbonic oxide of the air; the function of the blue rays is not known; they must stand in some important relation to the inner life of the cell.

The green pigment is not diffused uniformly throughout the cells of the leaf. It is contained in little granules or plates within the cells, apparently dissolved in fat. The plates have movements of their own within the cell and these movements have distinct purposes. Just as the leaves alter their position, rotate upon their stems or petioles, according to the direction and amount of light, so do the chlorophyll plates. If the light is moderate they turn flat to face it. If too strong they turn their edges to it so as to prevent the leaf from getting over-heated.

But the pigment is not always green. In some algae growing beneath the surface of the sea it is red. Here the green and greenish-blue rays are relatively intenser than the red and must be utilized. For that, their complementary pigment is necessary.

STUDENT

Dwindling Comets

IT seems possible that we may ultimately lose our beloved Halley's comet. At each of its more recent returns it has been smaller. Like other comets it has no instinct of economy. They hurl from their heads huge volumes of rarefied material in order to develop resplendent tails, sometimes more than one. But they forget that as they near the sun the pulse of solar light upon them may force the tails outward and backward into space, never to be recovered again. For the outgoing pressure of light upon matter of sufficiently minute particles is greater than the gravitational attraction.

A comet is an extremely active and thoughtless personality, forgetting that if it insolently sweeps up too near a planet it may become annexed and have to settle down into a satellite. In addition to its onward speed it is in intense internal commotion. A nucleus appears, divides, disappears. Tails are swung out in front or behind. The tails are never still; they too divide, throw out side branches, and disappear. And from their behavior in the case of two comets, Halley's and Morehouse's, it has been suspected that comet and tail rotate on the axis of their path, corkscrew-wise. This is probably the case with all of them. Theosophy teaches that the force which arouses them into active being, "Fohat," not known as yet to science, confers spiral motion upon the matter it energizes.

Wooden Water-Pipes

THE Forest Service not only gives instruction in the conservation of wood but also information as to the use of that material. In the case under consideration the use suggested may be considered an economical one, since the maximum amount of service is gotten out of the wood used, and an economy in another important material, iron, is effected. The praises of wooden water-pipes are sung by the Forest Service, which points out that they have been in considerable use, both in the form of stave pipes bound with wire and as hollow logs. To prevent rot, asphalt and tar are used; but timber saturated with water and protected from outside influences is described as practically everlasting. The wood pipes are equal in durability to those made of cast iron, and four times as durable as those of steel. They cost one-quarter as much as cast iron, and one-half as much as steel. (But that question of "cost" needs more consideration; is it present market value or ultimate cost to the country that is meant?) Wood pipe has a greater discharging capacity than iron or steel, because the bore remains smooth. Electrolysis does not affect it. It insulates the water against heat and cold. It accommodates itself to the expansion of freezing and does not burst. The wood used on the Pacific Coast for this purpose is Douglas fir. STUDENT

Nitro-Bacterine

THE tubercles or nodules on the roots of some leguminous plants contain bacteria which have the power of drawing nitrogen from the air and fixing it, thus providing sustenance for the plant. Some years ago a scientist succeeded in preparing a pure culture of this bacterium, and since then investigations have been made to discover how

to preserve it so that it could be distributed among farmers for the inoculation of their peas, beans, etc. At one time it was dried on cotton wool, and later on pure cultures were sent out in liquid form. But Professor Bottomley of King's College, London, has produced a powder preparation of the bacteria which will last for two years. It is called nitro-bacterine and is sent out in three packets, one containing the bacteria and the others the chemicals necessary to impart vitality to them. The contents of these packets are put into water and kept digesting for a day or two according to directions supplied, and then the seeds are well sprinkled with

the mixture. The seeds are dried, the microbes becoming torpid; and when they are sown the microbes come to life again and commence work on the roots, drawing nitrogen from the air and stimulating the growth of the plant.

With this inoculation plants can be grown in soil that has been supposed incapable of supporting growth; thus Mexican beans were grown in volcanic ash, and sweet peas in cinders. But some soils cannot be made to act, owing to other unfavorable conditions, such as acidity, improper drainage, the presence of inimical bacteria, or insufficiency of salts. Very favorable experiments in the use of inoculation have been carried out, and Professor Bottomley has discovered a culture for the tomato, and other cultures for roses and strawberries. T.

Nature-Study through Sympathy

ONE day Soshi was walking on the bank of a river with a friend. "How delightfully the fishes are enjoying themselves in the water," exclaimed Soshi. His friend spake to him thus: "You are not a fish; how do you know that the fishes are enjoying themselves?" "You are not myself," replied Soshi; "how do you know that I do not know that the fishes are enjoying themselves?" — From *The Book of Tea*, by Okakura Kakuzo

Fullers' Earth in the United States

THIS very absorbent clay, first used for taking grease spots out of cloth, is now used in the United States chiefly for clarifying oils. It is a greenish or brownish, soft, somewhat unctuous substance, which does not become plastic with water, but crumbles down to mud. It is a hydrous aluminous silicate with some magnesia, iron oxide, and soda. In the United States nearly 70 per cent of it comes from Florida. H.

ACCORDING TO THE RULE OF VIRTUE

THE Power, immutable, unspeakable, supreme;
Which builds, unbuilds, and builds again,
Ruling all things accordant to the rule
Of virtue, which is beauty, truth, and use:
So that all things do well which serve the Power;
And ill which hinder: nay the worm does well
Obedient to its kind; the hawk does well
That carries bleeding quarries to its young;
The dewdrop and the star shine sisterly,
Globing together in the common work.

Sir Edwin Arnold

The Principal Purpose of the Universal Brotherhood and Theo- sophical Society

THE Constitution of the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY is, in the estimation of Theosophical students, the Magna Charta of a redeemed and glorified humanity. Of it Katherine Tingley has said: "Brought into the plane of earth-life from the upper air, it reaches deep into the bowels of the earth in its scope and purpose."

It is declared in the Constitution that this Organization was "ordained and established for the benefit of the people of the earth and all creatures." Sections I and II of Article II of the Constitution read:

I. This organization declares that Brotherhood is a fact in nature.

II. The principal purpose of this organization is to teach Brotherhood, demonstrate that it is a fact in nature, and make it a living power in the life of humanity.

These two declarations, like the overture to a grand opera, foreshadow the keynotes and rhythm, the main themes and motifs, with their relations and combinations, to be worked out in rich detail in the development of the great work of the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY, ordained and established, as said, "for the benefit of the people of the earth and all creatures," by the Elder Brothers of Humanity.

Article III, Section I of the Constitution states that "This Brotherhood is a part of a great and universal movement which has been active in all ages." It is not proposed to go into that here, but it is introduced because of what H. P. Blavatsky says in the last chapter of *The Key to Theosophy*: "Every such attempt as the Theosophical Society has hitherto ended in failure"; and she says there in effect that if this present movement were not true to its principal purpose, "it will drift off on to some sand-bank of thought or another, and there remain, a stranded carcase, to molder and die."

Older students of Theosophy know how the

most strenuous and incessant efforts were made throughout the early history of this Movement to divert it from its principal purpose, to make it stand for and teach anything and everything but Brotherhood, even indeed, psychic profligacy of the worst kind—the very thing H. P. Blavatsky and her Teachers organized the Theosophical Movement to avert.

And so when Katherine Tingley succeeded Mr. Judge, H. P. Blavatsky's successor, in the Leadership of the Movement, she accentuated the principal purpose by re-naming the Organization—the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY, and by giving us its grand Constitution in which the work was re-organized, and safeguarded from any possible future misunderstanding or misrepresentation.

The "principal purpose" of this organization then, is "to teach *brotherhood*." That at once stamps it as unique, distinct from all other associations of people who, however banded together in cliques, castes, sects, and creeds for some exclusive benefit, would try to narrow down this universal fact of nature and confine it to private and partial ends, making use of it indeed, but in effect denying its universality. The "principal purpose" of this organization is to teach *Brotherhood*. How? "By demonstrating it as a fact in nature," and by making it "a living power in the life of humanity."

The highest aspect of nature we know of is, of course, human nature; and this will be dealt with first. We will pass lightly over the greatest examples of human nature, the Leaders and Teachers of mankind, the founders of religions and civilizations, and such great souls in the historical period as Hypatia and Joan of Arc, for they are living examples, the absolute demonstration of Brotherhood: we will pass over these, which are "the puzzles of history," and speak from the point of view of ordinary everyday life, saying that even here brotherhood is its own "proof," and merely needs pointing out as a facet of that basic brotherhood which is a fact in nature.

The fact of human associations generally, for mutual, if partial, benefits, is, as already pointed out, based on the law of brotherhood, which is positively stated in the motto of certain organizations; for instance, "United we stand, divided we fall."

Coming down to individual life: How often is it said among those who labor with their hands, "Don't lend So and So any tools, don't show him anything, don't help him—he is no good to anyone, he is all for himself." Brotherhood is thus recognized—and denied to the unbrotherly man. Again, what is the highest praise that can be given to the most exalted of men? "He was a man and a brother." Further, when all the pretences and selfishness of life are over, and man goes to his long home, what is at once the greatest comfort the mourners can draw for themselves and the finest eulogy they can bestow upon the departed one? "He was a good citizen, a good husband and father, a true friend," i. e., a *brotherly* man. Thus, from the games of childhood, through the labor of the long years to the final rest, brotherhood is recognized and acted on, if but partially, and accepted as the flower of human life.

Try to imagine human life without brotherhood. It is unthinkable. Human *society*:

the very word *society*—from the Latin *socius*, a companion, a brother—is final. In times of calamity, of direst need, when the ordinarily unchecked selfish interests are silenced in the face of a common tragedy, how brotherhood becomes the saving power, rich and poor, cultured and ignorant working together for the general good, nations in all parts of the world expressing their brotherly feeling in gifts of money, food, and supplies for the help of their unfortunate brethren!

Now Theosophy teaches that this universal—though as yet only partially recognized—fact of brotherhood, is a cosmic force which, rightly understood and used, would bring about a human society "proportionate to nature," a divine humanity.

Take a simple illustration: we are but in the infancy of our knowledge and use of electricity, and yet how incredibly has it enlarged man's powers, annihilating time and reducing space to ever smaller significance. Yet we have but begun, and the possibilities are endless.

It was known for ages that electricity was produced when certain substances were subjected to friction; but there it stopped, an interesting fact, without significance. It was found out, however, that this feeble phenomenon was a mighty cosmic force which man could tap and by its means use other nature forces enlarging and enriching his life, along certain lines, endlessly.

So brotherhood, which the friction of everyday life evokes and forces us to use in a feeble way, is a mighty cosmic force upon which in fact depends the future moral and spiritual growth of mankind, a future whose growth and splendor have no limits because, as Theosophy teaches, "Help nature and work on with her, and nature will regard thee as one of her creators and make obeisance."

There is a further aspect of the question: it may seem a paradox in this age of sectarianism to say that religion affords a sure ground for the proof and realization of brotherhood. But the student of Theosophy knows that all the religions of the world are offshoots of the once universal Wisdom-Religion and he can trace the descent therefrom of the latest and smallest sect. His motto, that of the organization he belongs to, is "There is no religion higher than Truth."

Imbued with the universal aims, enriched by the grand philosophy and historical teaching of Theosophy the student can point out the core of truth in all religions and show that Theosophy is the common origin and meeting-ground of all religions and that apart from accretions and distortions all are fundamentally identical in standing for the divinity and consequent brotherhood of man; and he can show that in Theosophy all the religions will find their lost word, their missing links; and that—as has been well said, and proved by the people of all shades of religious opinion now in the Theosophical Movement—"Theosophy is but the extension and fulfilment of their previous beliefs," the completion of all the fragmentary and scattered truths which all religions contain. When this is perceived, as it will be, we shall see on a much larger scale a repetition of what happened in Turkey when but political freedom was restored—Jews, Christians, Mohammedans, and all, embracing one another and working together as

brothers, realizing that brotherhood, in the Theosophical sense, is indeed "Religion by her deeper name," and that "To live to benefit mankind is the first step."

It is through centuries of false teachings as to the nature of man and his relation to the divine that men have lost hold on their divinity, their essential brotherhood, not of the flesh merely, or even of the mind—which all thinking people will admit—but in their divine oneness. Because of this men have been *unbrotherly*, have lived on the night side of their nature and so have reaped such a harvest of unbrotherliness, of *their own sowing*, that as Katherine Tingley says, "Unbrotherliness is the insanity of the age."

But we are all divine souls; and though we have but imperfectly understood the divine inspiration, it is first, all the time, and last—brotherhood, *brotherhood*, BROTHERHOOD. Says Madame Blavatsky in *The Key to Theosophy*:

Universal Unity and Causation; Human Solidarity; the Law of Karma; Reincarnation. These are the four links of the golden chain which should bind humanity into one family, one Universal Brotherhood.

STUDENT

THEOSOPHICAL FORUM

Conducted by J. H. Fussell

Question

In last month's issue of the *Atlantic Monthly* is discussed the question "Is Immortality Desirable?" The article is thoughtful and interesting, and the conclusion of the writer is that immortality "is desirable, if immortality means a fortunate issue of the quest of our souls." Still there seems to be something lacking from the treatment of the subject. How would you look at it from the standpoint of Theosophy?

Answer

II. It depends upon what we are to consider immortal. Is the bundle of characteristics, which constitutes all I know of my friend A, to persist forever? We may devoutly hope not. Heavens, what a bore to you would that hobby become, to which you have devoted your life, were you to be saddled with it through the eternities! Do we not carry a load of memories through life, which we would fain have blotted out, could it be done; think how such things would torment and stare at us after an age or two!

Let us represent all human characteristics by letters of the alphabet, and think of a man as written down thus, in a kind of imitation-algebra: $a^2 + x^3 + z$, or $pq + rt - y$. What purpose would there be in keeping that x^3 or pq stationary, and integral to him forever? Let us say that a man is an excellent book-keeper with a splendid head for figures; is something of a pedestrian in his spare time, and has fondness for light reading. Now carry that man, with that personality, forward in a straight line, so to say, for a million years or so; which is, after all, but a very small fraction of eternity. There has either been stagnation, which we can hardly imagine; all manhood has left him, and he has become a figure-adding, pedestrianizing, light-reading vegetable, without the least value or consequence: or he has grown, spent a million years in growing, in those same qualities; and has become a perfect figure-adding, pedestrianizing, light-reading machine—or demon. In the first case nothing whatever has been added to the sum of universal experience, and all effort is waste and folly; in the second, not a full and perfect man has been produced, but a lopsided, unhuman monstrosity. Theosophy would af-

firm that such are among the things which nature, very reasonably, abhors.

The kind of immortality we, without stir of imagination, for the most part "believe in," is one not of essentials, but of exteriors; not of our humanity, but of our characteristics. The grammarian dying at ninety, looked back on a life wholly given up to Latin nouns of the third declension. "Ah," he sighed with his last breath, "that I had confined myself to the genitive plural." We should not call such a one a man, but a fossil; his kindred is all under glass cases in our museums. What would he have grown to after a billion years of genitive plurals? Heaven would have been no heaven to him if, rising up to it with personal consciousness intact and character unaltered, he had been deprived there of his beloved research. And it takes hard work to alter character, as we know very well; mere dying will not do it. You cannot be at once a mummy and a living man.

Do you remember Chwang-tse's turtle? It had been stuffed, the sage said, and worshiped in the Hall of Ancestors for upwards of three thousand years. "If that turtle had its choice," he asked the ambassadors of the emperor, "which would it prefer; to be stuffed and worshiped in the Hall of Ancestors, or to be alive and wagging its tail in the mud?" Immortality of the personal man would soon come to mean, for most of us, a state as thrilling as Chwang-tse's turtle's. We should yearn after a little mud.

Now for the Theosophical view of immortality. Behind all our attributes and characteristics stands the Self, which is eternal and divine, "never begun, and without end." Its mission is twofold; to learn all possible lessons, through all possible experiences in earth-life; and to raise the whole material of the world to diviner levels. It is a ray out from universal divinity, sent forth for these purposes; "true, eternal, strong, pure, compassionate, just." It must invest itself with all kinds of personalities, and all manner of characteristics. It must know all that is to be known by soldier and poet and factory-hand, by day-laborer and merchant and king; otherwise it could not ripen within itself the fruitage of universal experience. Every letter of the alphabet must be brought in it to the power of n ; not only one or two, or three or four. Every clear, clean letter, that is; not the smudges and foul marks; not the unclean qualities that damn our lives.

Here are these bodies of ours, made of the stuff of the world; a continual change is going on in them, so that every moment old atoms pass away, and new ones are coming in their places. Do we set no imprint on these? Are the glutton and the sensualist of the same physical fiber as the hero? Obviously not. One man's flesh has been made brutal by base living, and base cravings inhere in the cells and material of it; another's is spiritualized, pure, refined. There is endless proof for anyone who will think, that all our thoughts print themselves on the atoms of our bodies and awaken kindred vibrations in them; these atoms go away the better or the worse for associating with us. The worse, when we have forgotten our real being, and live a false life in our desires and personality; the better, when we are reaching out towards the life of the soul. Yet all these atoms have to receive from us a spiritual touch to quicken their

evolution, and they will come back and back until we have left no stain anywhere. A great and good man sets kindred fires burning in all who associate with him, breathing his own soul through nations and armies, and awakening in them a spirit and valor like his own. It is our mission; such work has the soul to do for all life, and all vehicles of life.

First on its own personalities, playgrounds of elemental forces which it must learn to dominate, and employ for universal uses. It finds in them desire, selfishness, hate, and all the legions of chaos and disorder; these it must subdue and transmute. It sheds a ray from itself into the brain of each successive personality, which ray becomes the brain-mind. Into a whirling realm it has entered, where every cell is pulsant with the traffic and vibrations of life; into companionship, too, with subtle, unfolding desire, eloquent with specious suggestions and promises. Between this and the soul it veers, for the most part unmindful of the latter, and causes are set in motion, deeds done, thoughts innumerable thought; the sowing of a great crop, which must be reaped; for all action rebounds, and our good and evil fortune is the result of our own doings. Always the soul is using what influence it may, which we perceive in what is called conscience.

Death comes, and then a period of rest in which all the experience gained in the past life must be garnered by the soul and welded into its being. Then the time for new embodiment; a new personality, founded on all old ones, with new brain and memory, new experience and new employment. So on from the beginning of time until all the glory and beauty of the world are known, all sorrows suffered, all wisdom and heroism and compassion displayed.

It is the divine part of us which is immortal, the part that knows how to deal with immortality—through an eternity of wonders, newness, action, growth, battle, life. STUDENT

THEOSOPHIST. I have just explained that the reincarnating Principle, or that which we call the *divine* man, is indestructible throughout the life-cycle—indestructible as a thinking *Entity*, and even as an ethereal form. The "reflection" is only the spiritualized *remembrance*, during the Devachanic period, of the *ex-personality*—Mr. A or Mrs. B—with which the *Ego* identifies itself during that period. Since the Devachanic period is but the continuation of the earth-life, so to say—the very acme and pith, in an unbroken series, of the few happy moments in that now past existence—the *Ego* has to *identify* itself with the *personal* consciousness of that earth-life if anything shall remain of it.

INQUIRER. This means that the *Ego*, notwithstanding its divine nature, passes every such period between two incarnations in a state of mental obscurity or temporary insanity?

THEO. . . . We do not view it as insanity, but as a very natural sequence or development of the terrestrial life. What is life? A bundle of the most varied experiences, of daily changing ideas, emotions and opinions. . . . Can it be said of a man of fifty that he is the same being that he was at twenty? The *inner* man is the same; the outward living personality is completely transformed and changed.—H. P. Blavatsky in *The Key to Theosophy*

THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY

FOUNDED AT NEW YORK CITY IN 1875 BY H. P. BLAVATSKY, WILLIAM Q. JUDGE AND OTHERS
REORGANIZED IN 1898 BY KATHERINE TINGLEY

C e n t r a l O f f i c e P o i n t L o m a C a l i f o r n i a

The Headquarters of the Society at Point Loma with the buildings and grounds, are no "Community" "Settlement" or "Colony." They form no experiment in Socialism, Communism, or anything of similar nature, but are the Central Executive Office of an international organization where the business of the same is carried on, and where the teachings of Theosophy are being demonstrated. Midway 'twixt East and West, where the rising Sun of Progress and Enlightenment shall one day stand at full meridian, the Headquarters of the Society unite the philosophic Orient with the practical West

Theosophy and Capital Punishment

FROM ignorance of the truth about man's real nature and faculties and their action and condition after bodily death, a number of evils flow. The effect of such want of knowledge is much wider than the concerns of one or several persons. Government and the administration of human justice under man-made laws will improve in proportion as there exists a greater amount of information on this all-important subject. When a wide and deep knowledge and belief in respect to the occult side of nature and of man shall have become the property of the people then may we expect a great change in the matter of capital punishment.

The killing of a human being by the authority of the state is morally wrong and also an injury to all the people; no criminal should be executed no matter what the offense. If the administration of the law is so faulty as to permit the release of the hardened criminal before the term of his sentence has expired, that has nothing to do with the question of killing him.

Under Christianity this killing is contrary to the law supposed to have emanated from the Supreme Lawgiver. The commandment is: "Thou shalt not kill!" No exception is made for states or governments; it does not even except the animal kingdom. Under this law therefore it is not right to kill a dog, to say nothing of human beings. But the commandment has always been and still is ignored. The theology of man is always able to argue away any regulation whatever; and the Christian nations once rioted in executions. At one time for stealing a loaf of bread or a few nails a man might be hanged. This, however, has been so altered that death at the hands of the law is imposed for murder only,—omitting some unimportant exceptions.

We can safely divide the criminals who have been or will be killed under our laws into two classes: i. e., those persons who are hardened, vicious, murderous in nature; and those who are not so, but who, in a moment of passion, fear, or anger have slain another. The last may be again divided into those who are sorry for what they did, and those who are not. But even though those of the second class are not by intention enemies of Society, as are the others, they too before their execution may have their anger, resentment, desire for revenge and other feelings besides remorse, all aroused against Society which persecutes them and against those who directly take part in their trial and execution. The nature, passions, state of mind and bitterness of the criminal have, hence, to be taken into account in considering the question. For the condition which he is in when cut off from mundane life has much to do with the whole subject.

All the modes of execution are violent, whether by the knife, the sword, the bullet, by poison, rope

MEMBERSHIP

In the Universal Brotherhood and Theosophical Society may be either "at large" or in a local Branch. Adhesion to the principle of Universal Brotherhood is the only prerequisite to membership. The Organization represents no particular creed; it is entirely unsectarian, and includes professors of all faiths, only exacting from each member that large toleration of the beliefs of others which he desires them to exhibit towards his own.

Applications for membership in a Branch should be addressed to the local Director; for membership "at large" to G. de Purucker, Membership Secretary, International Theosophical Headquarters, Point Loma, California.

or electricity. And for the Theosophist the term *violent* as applied to death must mean more than it does to those who do not hold Theosophical views. For the latter, a violent death is distinguished from an easy natural one solely by the violence used against the victim. But for us such a death is the violent separation of the man from his body, and is a serious matter, of interest to the whole state. It creates in fact a paradox, for such persons are not dead; they remain with us as unseen criminals, able to do harm to the living and to cause damage to the whole of Society.

What happens? All the onlooker sees is that the sudden cutting off is accomplished; but what of the reality? A natural death is like the falling of a leaf near the winter time. The time is fully ripe, all the powers of the leaf having separated; those acting no longer, its stem has but a slight hold on the branch and the slightest wind takes it away. So with us; we begin to separate our different inner powers and parts one from the other because their full term has ended, and when the final tremor comes the various inner component parts of the man fall away from each other and let the soul go free. But the poor criminal has not come to the natural end of his life. His inner body is not ready to separate from his physical body, nor is the vital, nervous energy ready to leave. The entire inner man is closely knit together, and he is the reality. I have said these parts are not ready to separate—they are in fact not able to separate because they are bound together by law and a force over which only great Nature has control.

When, then, the mere physical body is so treated that a sudden, premature separation from the real man is effected, he is merely dazed for a time, after which he wakes up in the atmosphere of the earth, fully a sentient living being save for the body. He sees the people, he sees and feels again the pursuit of him by the law. His passions are alive. He has become a raging fire, a mass of hate; the victim of his fellows and of his own crime. Few of us are able, even under favorable circumstances, to admit ourselves as wholly wrong and to say that punishment inflicted on us by man is right and just, and the criminal has only hate and desire for revenge.

If now we remember that his state of mind was made worse by his trial and execution, we can see that he has become a menace to the living. Even if he be not so bad and full of revenge as said,

he is himself the repository of his own deeds; he carries with him into the unseen realm surrounding us the pictures of his crimes, and these are ever living creatures, as it were. In any case he is dangerous. Still living as he does in the very realm in which our mind and senses operate, he is forever coming in contact with the mind and senses of the living. More people than we suspect are nervous and sensitive. If these sensi-

tives are touched by this invisible criminal they have injected into them at once the pictures of his crime and punishment, the vibrations from his hate, malice and revenge. Like creates like, and thus these vibrations create their like. Many a person has been impelled by some unknown force to commit crime; and that force came from such an inhabitant of our sphere.

And even with those who are not called "sensitive" these disembodied criminals have an effect, arousing evil thoughts where any basis for such exists in those individuals. We cannot argue away the immense force of hate, revenge, fear, vanity, all combined. Take the case of Guiteau, who shot President Garfield. He went through many days of trial. His hate, anger and vanity were aroused to the highest pitch every day and until the last, and he died full of curses for every one who had anything to do with his troubles. Can we be so foolish as to say that all the force he thus generated was at once dissipated? Of course it was not. In time it will be transformed into other forces, but during the long time before that takes place the living Guiteau in the realm of the mind and senses will continue carrying with him, and dragging over us, the awful pictures drawn and frightful passions engendered.

The Theosophist who believes in the multiple nature of man and in the complexity of his inner nature, and knows that that is governed by law and not by mere chance or by the fancy of those who prate of the need for protecting society when they do not know the right way to do it, relying only on the punitive and retaliatory Mosaic law—will oppose capital punishment. He sees it is unjust to the living, a danger to the state, and that it allows no chance whatever for any reformation of the criminal.—*Wm. Q. Judge* (from *The Path*, vol. x)

THIS Law—Karma-Nemesis, or the Law of Retribution—whether Conscious or Unconscious, predestines nothing and no one. It exists from and in Eternity, truly, for it is ETERNITY itself; and as such, since no act can be co-equal with eternity, it cannot be said to act, for it is ACTION itself. It is not the Wave which drowns a man, but the *personal* action of the wretch, who goes deliberately and places himself under the *impersonal* action of the laws that govern the Ocean's motion. Karma creates nothing, nor does it design.—H. P. Blavatsky, in *The Secret Doctrine*

We would also recommend him to take a sheet of paper and cover it all over with dots, in *quincuncem* like trees in an orchard, and to let each dot in the bottom row represent a man of today; then he can trace the genealogies backwards and forwards as he pleases. It is evident that my father was also father to all my brothers; and my grandfather was an even more unblushing pluralist. When we get back to all my innumerable progenitors of the hundredth generation, they must clearly have been guilty of the crime of "repeating" to an altogether inconceivable extent.

This problem is a sort of burlesque of some scientific and other controversies. Whether a million people have descended from one man, or one man has descended from a million people; and whether, consequently, the population of the world is on the wax or the wane; what a subject for a debate! E.

Missionaries "Catching Tartars"

IT is stated that the educational work begun by foreigners in Japan is being kept up by the Japanese themselves, most of the teachers and all the administration being native. While Western methods of education are largely made use of and Western knowledge taught, the teachers are intent upon keeping up the national traditions of language, literature and government; and "it may be doubted whether the schools are a Westernizing influence."

Western missionary enterprise has hooked a big fish, which it may have thought to land. But there are two other possibilities: the fish may haul the angler in, or the line may break. The Japanese evidently wish to adopt the Western spirit, not to be adopted by it.

One reads a wail from American missionaries over a disposition shown by the native Christian church in the Philippines to declare its independence. But what could the missionaries expect? They have said, Here is Christianity, teaching tolerance, freedom, brotherhood, etc., and the natives have said, Thank you; it is very good and we will accept it. But you must be obedient to the mother-church, the missionaries may have replied; and the natives would say, There is nothing in the Christian teachings that compels us to belong to an American church instead of having our own. So with Japan and other nations; they have taken us too literally. They have accepted the unadulterated gospel, and ignored the doctrine (which we have up our sleeve) that Jesus Christ is a Western God, whose chosen people are the Westerners, and who is jealous of other Gods. OBSERVER

Austerity and Religious Exaltation

IT is announced that a Grand Duke, having lived in great luxury, which he enjoyed to the utmost, has resolved to abandon it all and become a monk, having a wooden bed and the simplest furniture and clothing, eating barley broth and black bread, rising in the night to pray, and observing silence.

Mark Twain came upon a Trappist monastery in Africa, where the inmates lived the most ascetic life possible and seemed to enjoy it.

The unbridled license of Roman imperial times was followed and accompanied by a wide-spread outbreak of monasticism and a perfect debauch of austerity.

The ardent desire for austerity after an out-

break of license is a familiar symptom to some people. There are people who oscillate continually between the two states.

Thus this kind of austerity is seen to be an inverted sensualism, or sensualism at its opposite pole; it satisfies a craving. The upsetting of the balance of our nature results in two extremes, which are always found in association. Each pole is the natural reaction from the other. Tolstoy has been described as passing from one of these extremes to the other. Lately he seems to have passed into a third state characterized by indifference. We frequently find zealous evangelists who have been sinners in the days of their youth, as they are so fond of letting us know.

Thus cold follows heat, and much of what passes for religious exaltation is but a condition of the nervous system, which has been thrown out of gear. There are many kinds of "psychism" which partake of this character.

Seekers after enlightenment should avoid everything that smacks of excitement and exaltation. The truly enlightened religious man is he whose nervous system is strong, stable, balanced, under control. If he seeks self-abnegation, he knows how to find it in plenty in ordinary life, and does not need to pamper his soul in a lonely cell. Nor, since his brain and spine are healthy and normal, does he need to goad his nervous mechanism into a feverish semblance of life by "creative assertion" or yet by drugs. All these means are stimulants of one kind or another and lead inevitably to greater exhaustion. Sanity and poise are the signs of true wisdom, and may serve to distinguish true from false Theosophy. T.

Hare and Tortoise

THOSE who want a really peaceful time, to throw the world off and get a three-year opportunity for meditation, should take the next (or nearly the next) boat for the North Pole. In the *Nineteenth Century* Mr. Alfred Harrison, the explorer, re-affirms that the best way is just to take plenty of food in your pocket—say to last three years—sit down on the ice with a board between, and drift with the leisurely Polar current. He proposes to do this in October of this year, taking his seat on the ice off Pulu Island and being sure that he (and the others) will float right across the center of the Arctic Ocean within striking distance of the Pole, finally coming out near Spitzbergen.

On his ice island he will build Esquimo huts and be as happy as—let us hope much happier than—the day is long; for it will not be of any length at all.

So we can choose. We can make a trifling few days of the matter with the airship of Mr. Wellman, or a few years with Mr. Harrison. The former does the delaying beforehand, and one even wonders whether the tortoise may not get in first after all. The aerial hare seems to find his wings a little refractory. C.

What is an Electric Charge?

OUR present attempt to see into the structure of the atom is by resolving it into an assemblage of electric charges . . . called electrons," says Sir Oliver Lodge. But one must confess to a difficulty in understanding what an electric charge is. One has hitherto conceived electric charges as always

being *on* something; whether electricity is a fluid, as in the older theories, or a condition in the "ether," as in the newer theories, it has always existed in connexion with matter. But now we have the notion of an electric charge existing apart from any matter charged. The difficulty is just the same as it would be if the physicists had analysed the atom into minute quantities of heat or of light, or a piano wire into minute particles of sound, or a human body into minute specks of vitality. There seems no alternative to regarding electricity as a kind of matter after all; or, at least, if electricity itself is not matter, it must be a condition in something that is. So all we have reached by this new conception is an extension of our analysis, which takes us below the atom as unit to another and more recondite unit. STUDENT

Radium and Underground Temperature

PROFESSOR JOHN JOLY has been discussing before the British Association the question whether radium influences underground temperature. He concludes that the idea that radium does raise the temperature is supported by observed facts sufficiently to encourage further investigation but not dogmatism. In the Simplon and St. Gotthard tunnels, higher temperatures were met with in some parts than were expected. Though this might be explained by various other theories—as that the degree of dryness of the various rocks causes the temperature gradients to curve up or down, or that some of the rocks retained extra heat from the effects of contortion—still, on analyzing the rocks, it was found that there was a marked relation between the proportion of radium and the steepness of the temperature gradient.

With respect to the theory that the earth's heat increases as we get lower, the facts seem to provide a plentiful crop of exceptions, and the theory can hardly be called established. Professor Joly thinks that, in order to account for high volcanic temperatures on the supposition that they are due to radium, we must suppose that the rocks containing it extend to a greater depth. And why not? What is a boring of mile or so compared with the radius of the earth? The whole question is much too unsettled for anyone to be able to dogmatize on it; and it is interesting to notice how the discovery of radium has played havoc with theories framed before it was discovered. This should lead us to allow always for the possibility of other discoveries which might have an equally revolutionary effect upon our theories. T. H.

The Source of Life

MEDICAL science appears to be rapidly reaching toward the ancient views, as is evidenced by the following extract from *The Lancet*. J.

It is conceivable that as the animal exists only by virtue of a continual combustion process, in which air is taken up while carbon dioxide is liberated, the loss of an agency which not only removes this product of respiration but sends back oxygen in its place, would be disastrous. This agency is of course the plant, and, in short, the animal and the plant are interdependent. On this line of reasoning animal life would be extinguished if vegetable life ceased . . . [and vice versa]. This is an interesting cycle of events, but the performance of a cycle implies a force, and the motive power of these . . . processes is light. . . . Were those who worshiped the sun ignorant of these things?

Art Music Literature and the Drama

Literary Tragedies of the Time

A NOTABLE contribution to England's current literature is a fiery article by the poet William Watson, who declares that England starves her bards through her own selfishness and neglect. The immediate occasion for the article was the death—presumably by suicide—of a brother poet, John Davidson. One cannot say that England is unique in this respect—far from it. America would profit by a little reminder on these lines, not to speak of Italy, of Germany, and of many another nation. We reprint a portion of Mr. Watson's article as follows:

This episode in the literary history of England is one more addition to the long list of tragedies which we may consider as beginning with the death of Spenser "for lack of bread" (if Ben Jonson's words are to be trusted), and which emphatically did not end with the death of Chatterton in his miserable garret, murdered by the editors who had accepted his contributions and paid for them at the rate of eightpence for a poem and one shilling for an article. For let there be no mistake about it: John Davidson died because he could not make a living.

Let me say at once—and I trust no one will be so base as to suppose that I say it from any ungenerous motive—that I attach little importance to his later work as a poet. The thought in it was often crude; the voice in it was often strained and hoarse. But whose fault was this? It was the fault primarily of the so-called "public" and the critics who are perpetually demanding from a poet an "output" (that I believe is the beautiful word that is commonly employed) such as no artist can produce without doing murderous violence to his powers and his artistic conscience.

Let it, then, be freely acknowledged that Davidson had exhausted himself long before his last volume saw the light. None the less, this was a man who, notwithstanding all the crudity of his later thinking, all the resentment against society and fate which made much of his utterance so turbid, was yet a creature with something of the divine fire in him—something of the infernal fire as well, which also we need in a poet.

The Davidson tragedy, it must in candor be admitted, is one of a class in which we English—and also our Scottish neighbors, when one comes to think of Burns—have attained to a somewhat unenviable eminence. When, if ever, are these tragedies to cease? It is to be feared that we shall never be quite without poets; and if the popular apathy regarding them goes on increasing—if the intellectual life of the nation becomes more and more swamped by money-making, athletics, and the devotion of grown men to boys' games—the Poet's Tragedy is likely to happen with increased frequency. One does not wish one's country to become a byword for that sort of thing. Narrowing one's outlook for the moment to literature alone, it would appear that fiction is the only form of it which retains any power of effective appeal to the popular intelligence. I suppose there are fifty paltry novelists who make anything from a thousand to two thousand pounds a year, but it is as possible as it was in the early days of Samuel Johnson for a genius capable of conferring luster on any age or country to live in obscurity and cruel neglect and to die at last of the accumulated fury of a lifetime—as John Davidson died.

"When, if ever, are these tragedies to cease?" asks Mr. Watson. When enough people wish them to do so—enough, that is, to constitute an argument of sufficient importance to win the attention of the majority. The god today is not Prometheus but the dollar. The path most sought is not the steep and winding way leading to Parnassus' heights but the broad and easy one leading

to the ownership of town house and country villa and more automobiles. The ideal is to accumulate, to pile up, to increase, for oneself and one's relatives, not to give and give until the very life itself becomes a shining sun of brotherliness. If men only realized that the things in which we differ from each other—the little matters like personal luxuries and intellectual ornaments—are the unimportant things and that the heart-life, which is one and indivisible, is the important! There is the personal life, by which A is A, and B is B; there is also the larger life which

Mr. Ramberg recently visited Lomaland

DEN är ej husvill i livet, som kan fly till vad människa lärt haft heligast, ädlast, bäst, och dessutom kan fly till själen, till sitt kall, sin bestämelse, sina minnen.
Tegnér

He is not homeless in life who can resort to what is holiest, noblest and best in human kind; who even can resort to the soul, to his duty, his mission, his memories.

is like a universal atmosphere and which A and B breathe in common. It is the life of which every good impulse, every act or word that flows, careless of possible reward, from the heart, every brotherly act, stand as proof and expression.

When men first learn that there is this life, this higher, purer air to breathe, and then consciously will to rise to their every opportunity as Souls and live the Soul-life, there will be help for the Poes and the Burnses and the John Davidsons of the future and they themselves will live better-rounded, because less strained and saddened, lives. STUDENT

The Language of the Cheyennes

THE presses have just finished their work upon the first book ever printed in the language of the Cheyenne Indians of America. It is the effort of a Swiss linguist who a generation ago came to America and entered upon work among the Cheyenne tribes. According to the Smithsonian Institution's *Handbook of Indians of North America*, he is "our best authority upon the Cheyenne language."

The tongue of the Cheyenne Indians has been spoken of as a "modern dead language," but its actual death would seem now to be in danger of postponement, for books printed in it will exert a strong influence towards preserving it in use. It is said to have but three vowel sounds and to dispense with a number of our consonants—as d, f, j, l, and r—and it is a language of monosyllables, each syllable being carefully articulated by those who would not belie their knowledge of it.

"To know the value of every syllable and to speak that plainly and rather slowly without a break in the sentence is considered the old correct Cheyenne," says Dr. Petter. "The younger generation is unconsciously influenced by the English, and there is a gradual tendency to use detached particles and careless forms. There is no marked dialectic difference in the different Cheyenne bands in Oklahoma and in Montana, although the latter are slightly influenced by the Sioux.

"In religious ceremonies the rites, not the words, are of most importance. Recent religious influence, either from the Messiah belief or the 'mesal bean' (peyote) brought more prayers, songs, and speeches into the religious life, but without enriching the language or bringing out archaic forms. Obsolete and archaic forms are found in old prayer formulas and incantations. Certain archaic forms are used by certain bands or secret organizations and are known only to themselves."

When the translator adds that "investigation will show that the archaic forms are few in number and of little importance," we must disagree with his conclusions. Rather will proper and resourceful investigation—if indeed such be at this late date a possibility—show that the archaic forms now existing are but remnants of a large group which dates from a prehistoric civilization of immense importance. H. P. Blavatsky declared, what the science of archaeology has since "discovered," that the American Indians, now so scattered and (comparatively) degenerate, are remnants of a race that could boast of a high civilization and immense antiquity. But missionaries and exponents of this or that particular creed cannot afford to admit it, and it is unfortunate that their conclusions are so often indiscriminately accepted.

In *The Secret Doctrine* H. P. Blavatsky treats of the evolution of language which is, she declares, cyclic, through "childhood, purity, growth, fall into matter, admixture with other languages, maturity, decay and finally death"; and she states, with respect to the languages of ancient Atlantis (part of them inflectional), that "the agglutinative decayed and remained as a fragmentary fossil idiom, now scattered, and nearly limited to the aboriginal tribes of America." STUDENT

Let us cast aside creeds and dogmas and unite as brothers.—Katherine Tingley

TO those who can "discern the signs of the times" in regard to the status of woman—now

so plainly rising, through hurricane, storm, and over obstacles, to its ancient and far higher place—the birth of the little Princess who is heiress to the Dutch throne has a special significance. True to the time-honored but unmistakably Dark Age ideal—for in a brighter day nations will not care whether a King or a Queen occupy the throne so be it that an awakened Soul wields the scepter—the hope was general that the Dutch people might have the joy of welcoming a Prince. But alas for the "plans o' mice and men," and thanks to that Karmic goddess who presides over the affairs of nations and of men and who calmly dispenses justice, even when we would much prefer favor and injustice, it was a Princess who came knocking at the hearts of her loyal subjects to be.

Fortunately for Holland the Salic law (or rather that part of it which has come, through custom, to be referred to as if it were the whole) is not in force in the nation of the Hague. Had it been it is likely that Holland would have been something other than a free nation by this time. Until the birth of Queen Wilhelmina's little daughter, recently, there have been born no royal heirs to the throne of Orange since August 31, 1880, the birthday of the present Queen. She became ruler of Holland when but ten years of age although her mother, Queen Emma, acted as regent for eight years thereafter.

A descendant of William the Silent, the first great Prince of the House of Orange, Wilhelmina was reared with the utmost simplicity under her mother's most wise and far-seeing supervision. One result has been a great simplicity of life in the present royal household and another will be, doubtless, the provision of a simple and wholesome environment for the early years of the little Princess so lately arrived and so royally welcomed by all.

The Little Dutch Princess

"England," it has been wittily remarked, "has always been partial to Queens," and as evidence we have but to instance the great ages of her Queens Elizabeth, Anne, and Vic-

arily gifted herself in music, art, and letters; and even the Orient where the average woman's place is not enviable and where to be a mother of girls only is to be doubly unfortunate, safely trusted for a generation the destinies of its largest nation to the strong hands of a woman, Tsi-An of China.

Farther back shine out the Spanish Berengaria, Zenobia of Palmyra, Dido of Carthage, Cleopatra of Egypt, and Boadicea, Queen of the Iceni. Beyond these still, many of them rising like stars above the sunrise sky of strictly historic days, we see Radigunde of ancient Germany; Semiramis and her successor of the following century, Nitocris, of Babylon; the Queens Mertiteps, Menkara (or Nitocris), Aahhotep, Hatshepsitu, Mutemva, Tiy, Nefert-i-Tain, and Batria of old Egypt; the Empresses Chang-sung-chi and Se-ling-shi of earlier China; Nour-mahl of India; the Queen of Sheba, by name Balkis; the Empresses Zingou, Sinko, Kokyoku, Jito, Gemmyo, Gen-sho, Koken, Myōshō and Go-Sakuramachi of old Japan.

Presumably the history that archaeologists will one day make it possible for us to write of prehistoric America—Central, North, and South America—will record the achievements of mighty Queens. If not, the great Western continent will be an exception on at least one line, and that is not probable. Already—just as Katherine Tingley prophesied many years ago would be the case—historians are discovering that some of the Queens of the past have been much maligned by the spirit of jealousy, much misunderstood, and among them are doubtless Cleopatra and Semiramis.

Then, too, how can we omit mention of those uncrowned Queens, Joan of Arc, Hypatia of Alexandria, Sappho of Lesbos, Cornelia and Volumnia of old Rome, Birgitta of Sweden, Madame Guyon of France, and the immortal Madame Roland? And it is an inspiration to mention those modern women,

THIRTEEN YEARS AGO—THE GREAT CRUSADE OF AMERICAN THEOSOPHISTS AROUND THE WORLD

ON June 13, 1896, the Crusaders left New York. . . The countries visited were England, Ireland, Scotland, France, Holland, Germany, Austria, Switzerland, Italy, Greece, Egypt, India, Australia, New Zealand, Samoa, Canada, and finally the States of America from West to East. In these places existing Lodges were visited, new ones formed, public meetings held; and much practical Brotherhood work done among the very poor of large cities. At Dublin, on August 2, the Convention of the Theosophical Society in Europe was combined with the visit of the Crusade, and the post of "Corresponding Secretary," vacant since the death of H. P. Blavatsky, was revived in honor of Katherine Tingley. On August 6, the Crusaders visited Killarney, camping near the Lakes. Here the Irish corner-stone for the School of Antiquity was selected by Katherine Tingley. During the Crusade the Great Pyramid in Egypt, the remains of the Temples of Eleusis in Greece, and the caves of Elephanta near Bombay were visited. The effect of the Crusade has been vital and far-reaching. Not only stimulating public interest everywhere and laying broad foundations for future similar work, it roused the energies of the members in every country to their utmost, and the enthusiasm thus called forth has never waned.

From the Mysteries of the Heart Doctrine

toria. However, in that seeming partiality she can clasp hands with not a few of her neighbor nations, for Queens have seemed to try to atone for their lack in numbers by their greatness as individuals.

Spain had her Isabella; Austria, the unparalleled Maria Theresa; Russia, Catherine the Great; Roumania, Carmen Sylva, so great in philanthropy, so remarkable for her patronage of letters and the fine arts, so extraordin-

who, reigning not alone but as Queens-Consort, have done a great work in guiding national currents of thought and ideal towards practical brotherliness. Victoria of Spain, Elena of Italy, Carmen Sylva of Roumania, the Empress of Japan who surprised the world by her energy in directing relief work during the late war, Alexandra of England, and Queen Maud of Norway are only a few among those of the present generation who have had minds above personal aims and have been conspicuous in engineering needed reforms. The "City of the Blind" established by the Queen of Roumania and already described in these columns, is one of the most beneficent and far-seeing works of compassion the present age has afforded.

Greetings, then, and a salute royal to the little Dutch Princess. May she live to guide as wisely as her mother is now doing the destinies of one of the bravest nations that ever fought for freedom of conscience or claimed and won the hitherto unachieved.

A New Opening for Women

BACON says "a garden is the purest of human pleasures, it is the greatest refreshment to the spirits of man, without which buildings and palaces are but gross handiwork."

In this strenuous age, when so many women are forced by necessity or choice to obtain employment at any cost and are rushing into trades and occupations little suited to their sex, really desirable professions for girls are greatly wanted. It seems likely that one suitable occupation for cultivated and healthy women will be found in the delightful art and science of landscape-gardening. In a few years a good knowledge of the subject can be acquired by one who is really interested in nature, and a large capital is not necessary. The considerable number of girls who are taken abroad by their parents have splendid opportunities of studying the characteristics of the stately and romantic gardens and parks of the different countries of Europe, and even the quaint and artificial but intensely interesting ones of Japan, the most artistic of all.

The amount of physical work required for the designing and superintendence of ornamental garden work is not too severe for a woman, and it is a thoroughly wholesome occupation, good for both mind and body. Women of refinement, who generally possess greater natural feeling for color-design and grouping than the average man, and who have an instinctive sympathy and love for flowers, ought easily to take the leadership in the art of landscape-gardening. A knowledge of botany and a certain familiarity with flowers and trees are the first essentials for success; and geometry, chemistry, geology and physics must be studied by those who wish to become thorough masters of the subject, not to mention architecture and art in some degree. What a desirable thing it would be if the energy which is so often wasted in painting indifferent pictures by thousands of would-be women-artists who have good taste but not

genius, could be diverted into such channels as the creation of beautiful gardens in which their abilities would be usefully and happily employed.

It is not only in the design and management of private or public gardens of cultivated plants that a new sphere for women is developing, for a demand is being made for natural gardens of wild flowers. An Ohio woman makes a good living today by planting and laying out wild gardens. While studying art in Europe she was attracted by the care and taste shown, especially in England, in preserving and adding to the natural beauties of the wilder portions of parks and gardens, and she soon felt that her real bent was towards building landscapes rather than painting them. She says:

Lomaland Photo. and Engraving Dept.

QUEEN ELIZABETH OF ROUMANIA
("CARMEN SYLVA")

EVERY true Theosophist is morally bound to sacrifice the personal to the impersonal, his own present good to the future benefit of other people. If the Founders do not set the example, who will?

H. P. Blavatsky

No one who loves wild flowers can visit England without realizing how much we Americans throw away. Not miss, but actually throw away by chopping down and rooting up our native trees and flowers to plant the imported, the cultivated. The sight of their flower-carpeted parks and daisy starred meadows made me long to get back home. I didn't care about painting landscapes any more, and I wanted to get back to Ohio and get my father to allow me a corner of a wood lot to make beautiful. . . . Although we Americans are only just beginning to realize the value of our natural surroundings, in Europe, especially in England, it has been a subject of serious consideration for centuries. There, when you have a fine tree, instead of cutting it down to plant a formal garden as we do here, they build their garden to give that tree the very best setting.

Why, in my own town I have known people to cut down magnificent trees for the purpose of building a brick walk from their door to their front gate. They wanted the walk straight, you see. It never occurred to them that a curved walk might be even

more effective and the fact that the tree they were chopping down had taken hundreds of years to grow and was a perfect specimen of its kind didn't appeal to them in the least.

A few months ago a full description was given in these columns of the picturesque wild-flower garden at the Headquarters of the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY at Point Loma, California, which has been admired by all who have visited it. It was laid out on a piece of apparently useless ground as an experiment, and the assiduous care and really loving attention given to it by a student who has made growth of wild flowers a life-long study, have overcome all the natural obstacles and made this unpromising spot a veritable paradise. Wild plants from all parts of California are thriving amid the local flora which form the mainstay of the garden; a rustic summerhouse makes a center of interest, and one or two miniature lily-ponds with goldfish add the touch of variety and movement which only the presence of water can give.

Notes by the Way

IT may be news to many to hear that Russia has thousands of women doctors; and lately there has been a strong tendency among intelligent girls to study land surveying and engineering, with the result that nearly fifty women from the St. Petersburg Higher Technical College have just received diplomas qualifying them to enter the State railway service or to practise as civil engineers. The director of the College says that these women have a brilliant future before them, for they were not only highly qualified in draughtsmanship, but were particularly successful in the practical courses, for which they had to travel to distant places where various constructive works were being carried on. The workmen under their control behaved better when the young women took charge, and a diminution in drunkenness took place.

The excess of women over men in England is well over a million. An exhaustive address was recently given by Miss B. L. Hutchins before the Royal Statistical Society, London, in which the speaker reviewed the possible reasons for this disproportion. She concluded that the lower death-rate of women was not the result of special privileges or protection, but the consequence of a greater constitutional strength and a more tenacious hold upon life. For every 100 men old enough to claim an old age pension there are 135 women. For the twenty years between 35 and 55 marriage provides for about three-fourths of the women. The higher death-rate of men is a source of economic weakness, for it leaves many women without support, and increases the competition for employment because of the children left dependent.

Rome pensioned the widowed mother of little children, recognizing that food, clothing and a mother's personal care bestowed upon growing souls were more effective as preventives of crime than were penal institutions as remedies for it. We have not yet arrived at that humane and just viewpoint. STUDENT

Kilmeny

A LITTLE more than a hundred years ago there lived in Scotland on the banks of the Ettrick River, a shepherd who came of a family that for hundreds of years had tended flocks and herds among the Scotch hills. The Ettrick Shepherd, as he is called, like many another shepherd whose name has come down to us as a singer of sweet songs or doer of great deeds, was endowed by Nature with rare gifts, in return, we must think, for his compassionate, tender care of some of her most helpless children. The Ettrick Shepherd lived not only in the everyday, work-a-day world, but in a fairy realm, into which he leads us in a lovely fairy poem called *Kilmeny*.

In the sweetest, most melodious verse, colored by the quaint dialect of his native hills, the shepherd bard sings of a fair maiden of twenty golden summers, so pure in mind and heart, that falling asleep one summer day in a woodland glen, she awakens to the sound of sweet singing in the unseen realms of faery. Around her couch of rainbow silk, Kilmeny sees fairy forms hovering, and she hears them ask, "What spirit has brought this mortal here?"

A gentle-voiced fay answers that it was he. For more than a thousand years, he tells them, he has been keeping watch and ward over womankind, seeking, always seeking, for a maiden in the full flower of her beauty who should be as spotless and pure as the snow of morning. Now he has found one, and he has brought her hither to give her everlasting life.

How the fairies crowd around Kilmeny! They dance in a ring about her, they clasp her waist, they kiss her cheek, they comb her hair, and best of all, they sing joyously:

Bonny Kilmeny, ye're welcome here;
Women are freed of the ancient scorn.
Oh, blest be the day Kilmeny was born!

They tell Kilmeny that they too, are appointed to watch over womankind, for her office is the most sacred of all on earth, but they sigh as they speak of the sad sights they must often see, and the unseen tears they often shed over maidens at the threshold of life. With clasped hands they exclaim fervently:

O would the fairest of mortal kind
Aye keep the holy truths in mind
That kindred spirits their motions see,
Who watch their ways with anxious e'e,
And grieve for guilt of humanity!
For dear to the viewless forms of the air
Are minds that keep as the body fair!

Then the fairies bear Kilmeny away to a new world, where no sun shines, but the dome of heaven itself glows with its own resplendent light. Through fields that gleam like emeralds, where deathless flowers blow, wanders the stream of life. In this they lay Kilmeny, and they smile radiantly, for they know that now her youth and beauty will never fade, but bloom on when moon and sun have passed from the sky and time is gone.

Wonderful sights now dawn upon Kilmeny as she is borne upward and onward by her

fairy comrades. Like blossoms drifting in a breeze, vales with groves pass beneath them. They are the abodes of the purest earthly spirits. Looking up they can see the sapphire gates of heaven; looking down, the world of men. At last Kilmeny rests upon the purple sward of a mountain side and her fairy guides bid her give heed, for she is now to see such sights as mortal has never seen before.

She looked and she saw nae land aright,
But an endless whirl of glory and light,
And radiant beings went and came,
Far swifter than lights on the linked flame.

Dazzled, Kilmeny turns away. When she looks again one-half of the glowing earth lies

THE GATES OF FAERIE

THEY say there be nae faeries mair;
Oh! blind are they that tell ye so,
For but yestreen, wi' my own een,
I saw the wee folk come an' go.

The stars were hid, but the moon was up,
An' the wanderin' wind was laid,
And the burn of blue went wimplin thro'
The grass o' the silver glade.

They stood atween me an' the moon
An' dancit softly in a ring;
Some was high as a blade o' rye,
An' some was sma' as tuft o' ling.

Some was dressed in a dress o' white
Wi' a girdle the moon had kissed;
But maist, I ween, had a robe o' sheen
Like the glintin' sun aboon the mist.

Syne sudden they began to sing.
Oh! the sang was woven wi' the sound
Of winds that pass o'er the growin' grass
And of waters that leap an' bound.

The sang it lifted me off the earth,
It lifted me up an' away;
But the faery-spell upon me fell
An' what was that sang I maunna say.

They tell there be nae faeries mair!
Oh! blind maun they people be
For but yestreen, sooth, I hae been
Ben the gates o' Faerie.

Pall Mall Gazette

unfurled before her. She looks into many lands. One fair country, with lakes and glens, mountains and hoary castles, she knows for her own native land, and over this her heart grieves sorely; for its queen is dead, and fierce battle wages, because one fair maid, who stood as her sovereign's shield, was faithless to her trust. In every land, as Kilmeny looks, discord, strife, and sorrow rule. But the fairies bid her look on, and although

To sing the sights Kilmeny saw
So far surpassing nature's law,
The singer's voice wad sink away,
And the string of his harp wad cease to play.
still Kilmeny continued to look until

the sorrows of men were by
And all was love and harmony.

She begs now to return to her own country to share what she has learned with the friends she has left behind. Especially she wishes

To warn the living maidens fair,
The loved of heaven, the spirit's care,
That all whose minds unstained remain,
Shall bloom in beauty when time is gane.

So Kilmeny falls asleep, to awaken again in the greenwood lane where the fairy had found her. Her arms were filled with fairy roses, a snowy mantle lay about her shoulders, a birch-green snood bound her tresses. Late in the gloaming of an autumn day Kilmeny goes home. Her mother's glad surprise you may imagine, for she had mourned her daughter as lost.

No place was now so dear to Kilmeny as the woodland glen. In the evenings she wandered there singing the songs of the faery realm. The wild beasts of the forest, and the tame creatures of the field came, and stood around, cheered and charmed. People, too came from far and near to hear her,

For it seemed as the harp of the sky had rung,
And the airs of heaven played round her tongue.

For O, the words that fell from her mouth
Were words of wonder, and words of truth!

STUDENT

The Match

SCRATCH—and in less than a second there is a flame ready to ignite anything that man may wish. This seems wonderful when we think of the countless ages during which fire was obtained with so much difficulty. For fire is necessary to man's existence and a way has always been found to produce it. Various are the means that have been taken, but the principle of friction is always used. One way employed by a primitive people was rubbing together pieces of quartz which had been covered with native sulphur. Dry grass or feathers were placed near by, so that the spark caught easily and then there was the desired flame. In China, bamboo was used, the silicious character of the outer layer rendering it easy to cause a flame. During the Middle Ages the most common way of obtaining fire was by the flint and steel and tinder box.

However in 1680 the usefulness of these began to wane for the match had been invented. It was Godfrey Hauckwitz of London who discovered this means by taking a piece of the newly discovered phosphorus, wrapping it in brown paper and rubbing it until it took fire and then igniting sticks which had been dipped in sulphur. He called them "chemical matches" and put them on the market in boxes accompanied by a vial of sulphuric acid. But they were very crude indeed, and far too expensive to be used extensively, as they cost fifteen shillings per box.

During the succeeding years many different kinds of matches were made and experimented with. But it was not until 1829 that the first really practical match was made in England, by John Walker, a chemist at Stockton-on-Tees. It consisted of a stick coated with chlorate of potash and phosphorus which was drawn through a piece of sand-paper folded and held tightly together. A box containing eighty-four matches with the sand-paper was sold for a shilling. Since that time there has been rapid advance in the manufacture of matches although the principle of Walker's method is still adhered to. H.

THE CHILDREN'S HOUR

THE RIVULET

RUN, little rivulet, run!
 Summer is fairly begun;
 Bear to the meadow the hum of the pines,
 And the echo that rings where the water-
 fall shines;
 Run, little rivulet, run!

Run, little rivulet, run!
 Sing to the fields of the sun,
 That wavers in emerald, shimmers in gold,
 Where you glide from your ravine crystal-
 cold;
 Run, little rivulet, run!

Run, little rivulet, run!
 Sing of the flowers, every one—
 Of the delicate harebell, and violet blue;
 Of the red mountain rose-bud, all dropping
 with dew;
 Run, little rivulet, run!

Run, little rivulet, run!
 Carry the perfume you won
 From the lily, that woke
 When the morning was gray,
 To the white, waiting moonbeam adrift on
 the bay;
 Run, little rivulet, run!

Run, little rivulet, run!
 Stay not till summer is done!
 Carry to city the mountain bird's glee;
 Carry the joy of the hills to the sea;
 Run, little rivulet run!

Lucy Larcom

Mesembryanthemum

MESEMBRYANTHEMUM, whom we will call Dew-Plant for short, belongs to the ice-plant family; consequently she knows how to store up moisture in her soft little fleshy leaves and so is able to make herself of much use in beautifying old banks which would be unsightly, if she were not willing to spread her soft gray-green moss over them.

She keeps herself alive all the warm summer months by using the moisture she has in store. But she is very quiet until the rains come, and then she swells her leaves and grows and spreads herself over the bare ground.

But she has other duties beside being just moss and covering up bare places. Wait until spring comes and I am sure she will surprise you, for she has been busy with this very purpose. She will give you just a hint of what she is going to do by the faint pink color which tassels out from her tiny buds. Some morning when the sun has pushed all the fog away, you will find that Miss Dew-Plant has turned pink, a beautiful soft pink! She is now one solid mass of little fringy blossoms, so close together that her moss is quite hidden from sight. She looks like a beautiful pink carpet and is full of all the sweet odors of the East, so fragrant are the little blossoms.

How the bees love her; Each little flower has hidden in its warm little heart the sweets for the bee and the powder to dust on his yellow legs. All the long sunshiny day the bees are busy among the flowers.

Lomaland Photo. and Engraving Dept.

PUCK, IN *A MIDSUMMER NIGHT'S DREAM*
 As presented by Katherine Tingley, with Rāja Yoga
 Children taking part

Did you ever wonder how it is that Miss Dew-Plant knows she must make her blossoms pink? Why should she not make them blue once in a while? But she never does. The coloring matter she draws from the soil makes pink flowers; and yet Madame Rose-Bush hangs her red roses over Miss Dew-Plant's head, and wee Miss Violet shows her little purple flowers under the rose, all growing from the same soil.

EUGENIA

Bob's Lesson

BOB was training his little puppy to walk round the garden paths instead of racing over the beds. It was a long task, but at last the puppy seemed to know what he should do and raced round the gravel path after his young master, who greeted him with so much praise and so many pats that his tail seemed in danger of wagging off. Uncle Charlie was looking on and presently both boy and dog came and threw themselves down in the shade of the tree under which he was resting. The puppy, tired with his gambol, was soon peacefully sleeping, and the little boy's attention turned to his uncle.

"I put him back seven times before he learned," said Bob.

"Was he pretty tired of you?" Uncle Charlie asked, with a twinkle in his eye.

Bob laughed, though he reddened. "No, he

wasn't," he said, "he licked my hand."

"Wise puppy!" said Uncle Charlie.

"Why don't little boys like doing things over and over again?" Bob asked presently, half-shamefacedly.

"Tell me why, yourself," his uncle answered.

"There seems to be two of us," the boy said slowly, "and one wants to and the other doesn't."

"And if you listen to the one that doesn't, there is trouble and an unhappy feeling spreads around, isn't that so?" asked Uncle Charlie. Bob nodded.

"It is well to remember that we can always choose to go with the one that wants to go the right way, if we like, and," he continued, "it is by doing things over and over again we become perfect. All nature teaches us this lesson."

Here Carlo waked up with a huge yawn and a funny little stretch, and much to Bob's and his delight, Uncle Charlie gave him his first lesson in jumping.

ETHNE

Why Mabel was Happy

OH, I feel so happy! I cannot tell you how happy I feel!" exclaimed Mabel, sitting down on a footstool at her aunt's feet, and laughing a merry laugh.

"Well, dear, why are you so happy?" asked her aunt, stroking her curls.

"Why, I wanted to go over to see Marion ever so much, and I did not go, and this is why I am so happy."

"But why should that make you so happy?" asked her aunt, mystified.

"Because I knew that I should stay at home and study my lessons," answered Mabel. "You see Auntie, it is this way: you know how impulsive I am, and sometimes I catch myself doing something which I would not do if I stopped and thought about it; and then I know I am letting my impulses run away with me instead of controlling them. Then if I just will not do it, no matter how much it makes me want to—oh! then I feel so happy afterwards, as if something within me were pleased because I refused to be led by my feelings. Do you understand what I mean?" she asked, her eyes glowing.

"Ah! you have discovered a secret of true occultism, my dear," answered her aunt.

"Occultism! I never could understand what that word means!" said Mabel wonderingly. "It always seems like something so far away and mysterious."

"And yet, we are told by the great Teachers that when we follow the simplest laws of life and try to understand and control ourselves, we practise occultism."

"Well, that is easy to understand; it isn't so mysterious after all!" exclaimed Mabel. "After this I am going to try ever so hard to practise occultism, for it certainly makes me happier when I don't do the things I want to do, when I know I should not." A.

THE SECRET DOCTRINE

THE
Synthesis of Science, Religion, and Philosophy

By H. P. BLAVATSKY

2 Vols., Royal 8vo., about 1500 pages; cloth.
(Index of 30 Pages as in First Edition)

NEW POINT LOMA EDITION IN PREPARATION

To be reprinted from the original edition of 1888, as published by H. P. Blavatsky

Vol. I treats of Cosmogogenesis
Vol. II treats of Anthropogenesis

What is Potential Energy?

IN books on physics one often meets with a singular confusion between the abstract and the concrete which must be very puzzling to the student and which the teacher finds difficult to explain. For instance, in the discussion of potential energy, we are told that when a stone is raised to a height its kinetic energy becomes transformed into potential energy. The raised stone has potential energy; and the mind naturally begins to try to form some conception of what that potential energy is. In what respect is the stone any different from before? Clearly there is no means known to science by which we can formulate the difference between the stone when it is on high and when it rests on the earth. But let us consider other cases of potential energy.

A coiled spring is said to possess potential energy. In this case it takes the form of a stress between particles of the metal. Gunpowder has potential energy, and here it takes the form of affinities among the atoms of the ingredients. But what conception can we form

of the nature of a latent or unexpressed force? What condition can we imagine as subsisting in the atoms which would cause them to gravitate together at the first opportunity? In short, what is an attraction? We can form no idea. It has been sought to get over the difficulty by considering this attraction as due to a condition in a hypothetical fluid (ether) postulated for the purpose; and in this case we need the intervention of the same or a similar fluid in the case of our raised stone. Its potential energy is due to the mysterious force which causes gravitation. So we may say that in lifting the stone we have (as it were) stretched the ether and it is striving to snap back. Thus we have an explanation, provided always that we rest content to accept the ether as a fact and do not try to explain it; if we do try to explain it, we are met with the same difficulty over again.

Science does not seem decided whether to regard potential energy as a concrete thing or as a mere abstract term denoting certain effects. This confusion of

thought is very prevalent. When we speak of energy in a man, do we use the term merely as descriptive of his behavior, or do we refer to some force or fluid existing in some part of his internal anatomy? A man exhibits great energy as a consequence of his possessing great energy; here the word is used in both senses. And so with other words: love is sometimes a sentiment which we feel and sometimes a mode of

conduct. A mother exhibits great love in consequence of the love she feels. In the one case the word denotes an abstraction, in the other, something concrete. It would seem as if what scientists call kinetic energy were merely a descriptive term denoting certain effects; and as if latent energy ought to be the concrete thing which the body possesses and which causes it to exhibit kinetic energy. But when we ask, "Wherein does this potential energy inhere?" we are at sea. It is not in the body, so the ether has been made to do duty.

Occult science, refusing to confound the abstract and the concrete, would define attraction and potential energy as *propensities*, and therefore as inhering in a mind. Every self-conscious being can realize what is meant by a propensity or desire; but we defy any physicist to give a dynamical or statical representation of it. Therefore such things as energy, attraction, force, etc., must remain, for physical science, abstractions, and it must continue to employ a terminology in which an abstract grouping of the effects of an unknown cause is made to do duty for the cause itself. "Potential energy is the power to work," we are told; but the "power to work" cannot be classed among the things we can touch and see; it is no more definite than the ablative absolute. Yet, in Occult Science, potential energy may be a reality; it may be possible for the Seer to see that stone thrilling with it, to see it glowing in the coiled spring and burning in the atom. Physics seems to be the science of abstractions, and Occultism the science of realities. And this is because Occultism takes mind and consciousness for its primary postulates, seeking therein the causes whose effects we see in the manifested world.

If we consider a cubical block of stone as a reality, then its cubical shape, its color, its weight, etc., are qualities of it; and if we speak of them alone, we make abstractions. There is no such thing as a shape, except in an abstract sense; neither can a color exist apart from a colored object of some kind. [The word "color" may be used in Occultism to mean some reality, quite apart from color as ordinarily understood.] But science says that the stone is built up of shape, color, density, and so on; thus reversing the logical process. The laws of thought are superior to those of physics, and nothing but confusion can result from trying to reverse them.

While "force," "energy," and the like are mere abstractions for physics, the words, as used by Occult science, stand for real things. The kinetic effects observed and calculated in

physics are not the real forces; though we can say that when a body is set in motion by a force it creates a secondary force. But the force is that which results from the moving of the body, not that which moves it. That which moves it is force in the Occult sense of the word. The force of gravitation is unknown, if we mean the force which causes gravitation; if we mean the force which results from gravitation, then it is absurd to speak of that effect as causing gravitation.

"Heat," as defined by physics, is a result; its cause is unknown. Heat, in Occult Science, is a real energy which causes the phenomena of "heat." Hence Occult Science is the science of realities, after all. STUDENT

The Unique American

TO the American Association for the Advancement of Science, Professor Boas pointed out a very common mistake of those who write ethnologically on the American nation.

We are or shall be the outcome of a very varied blend of other peoples. The blend may be very complex, but it will not be much more so than that which went to make many of those other peoples themselves. They too arose by very complex blends. Professor Boas said:

It is often claimed that the phenomenon of mixture presented in the United States is unique; that a similar admixture has never occurred before in the world's history; and that our nation is destined to become what some writers choose to term a "mongrel" nation in a sense that has never been equaled anywhere.

When we try to analyse the phenomenon in greater detail, and in the light of our knowledge of conditions in Europe as well as in other continents, this view does not seem to me tenable.

By way of example he historically analyses the blends of a few other nations. The Italian, for instance, is a highly complex mixture.

In the earliest times we find on the peninsula of Italy groups of heterogeneous people, the linguistic relationships of many of which have remained obscure up to the present time. From the earliest prehistoric times on, we see wave after wave of people invading Italy from the north. Very early Greeks settled in the greater part of southern Italy, and Phœnician influence was well established on the west coast of the peninsula. A lively intercourse existed between Italy and northern Africa. Slaves of Berber blood were imported and have left their traces. Slave trade continued to bring new blood into the country until quite recent times, and Livi believes that he can trace the type of Crimean slaves who were introduced late in the Middle Ages in the region of Venice. In the course of the centuries the migrations of Celtic and Teutonic tribes, the conquests of the Normans, the contact with Africa, have added their share to the mixture of people on the Italian peninsula.

It is hardly therefore from the mere diversity of contributions to his veins that the future American will acquire his special type. Otherwise, why should not the Italian have become that same future American?

On this single continent of ours we have practically every climate and every configuration and blend of land and water that the entire globe elsewhere exhibits. No other single country has the same diversity; few of them anything like it. But in even the smaller of those other countries the population often differs markedly in different parts.

Thus Dr. Ridolfo Livi, in his fundamental investigations on the anthropology of Italy, has shown that

the types of the extreme north and of the extreme south are quite distinct—the former tall, short-headed with a considerable sprinkling of blond and blue-eyed individuals; the latter short, long-headed, and remarkably dark.

Apart from this, there are several other areas exhibiting other distinct types.

Now if this be so in a little country, how much greater will be the same tendency to well marked varieties in our own? So far as this tendency to the production of varieties depends on local causes, climate, land, water, etc., so far will it be persistent. But as fast as it works, it will be met by diffusion, by mixture—nevertheless remaining operative throughout the steady negation of its effects. Travel will become easier than ever: there will be no international barriers of custom and language.

It is in this that the conditions are unique—a continuous tendency to the production of diversities as marked as if we were several peoples, continuously met by a blending whose perfection depends upon our being one people of one language. Thus we can keep our youth renewed and remain always a new people in the making, and thus the real unique American type will ultimately be seen.

And, looking on further, much further, we can see that as the barriers of diverse speech are broken down in the sway of some ultimate universal speech, as transit becomes yet easier, and as the feeling of universal brotherhood becomes universal, humanity as a whole will in the same way become one renewed and ever self-renewing race. STUDENT

Latent Heroism in Human Nature

AS an instance of a real hero is mentioned the case of Kissinger, a private in the U. S. Army, who offered himself, while in Cuba, as a man to be bitten by malarial mosquitos, in order to demonstrate a theory which has been the means of saving many lives and banishing much suffering. The man has contracted a terrible disease in consequence of his devotion, and is now wilting away under it; and appeals are being made to provide for his comfort.

Quite apart from any views that may be held on the subject of such experiments, the question of motive remains clear; the act was one of love and self-sacrifice. Such acts *prove* the reality of the higher nature, prompting to deeds that are unselfish. If we should postulate the instinct of self-preservation as being a primary motive in human conduct, then clearly it was in this case not the ordinary personal self that was to be preserved; that was sacrificed in the interests of a higher, wider Self. The man must have been conscious of the existence in him of this greater Self which insisted on asserting its own interests against the calls of the personal self. He felt that in serving his kind he was serving his own best interests. Yet he did not calculate the business in this way; he but obeyed the call of duty, the irresistible promptings of a higher instinct.

And there are many such in the world; but the pity is that so often they are denied opportunity for the calling forth of their nobility. Daily usage with its mean sordid customs, compasses them about and hedges them in; or so-called religion stands ready to switch their aspirations into a side-track. Devotion is too often harnessed to the heavy wagon of ignoble enterprise and paltry aims. This is surely what is meant by the sacrifice of the children;

for "children" means all that is innocent and fresh and young, whether in a young body or an old. And our civilization sacrifices youthful zeal and faith on the altar of cynicism and mediocrity and so-called expediency.

Of course there is never the want of opportunity to practise real heroism in any conditions; but people should have a little more encouragement. The larger life, of zeal for the common cause of humanity, should be made closer and more real. Perhaps the truest kindness we can do for many people is to give them opportunities for thus expressing their inner needs, and their Souls need our charity rather than their bodies. STUDENT

Between the Clouds

THERE have been eleven full-dress wars, some on the largest scale, during the last sixty years—that is, since the middle of the last century; and an almost continuous background series of small ones. There was the Crimea war of 1854; that of Italian Unity, beginning 1859; the American civil war; that between Prussia-Austria and Denmark, of 1864; that which secured Prussian supremacy in Germany, 1866; the Franco-German war of 1870; the Russo-Turkish war of 1877; the 1894 war between China and Japan; the Hispano-American war; that in South Africa; and the Russo-Japanese war.

A contemporary, enumerating some smaller ones—the suppression of the Indian Mutiny, the Russian advance in Central Asia, the two British invasions of Afghanistan, the French conquest of Tonquin, the Greco-Turkish war, the British occupation of Burma, the "expeditions" in Africa, including Morocco, the many South American wars and disturbances, and the two insurrections in Cuba—remarks that after all, man does not seem to be making such very rapid progress peaceward. Probably, indeed, no similar stretch of time has ever been marked by more bloodshed.

But it takes a good while for a large pot to boil, and until the last minute or so there is nothing to show that heat is effecting any change at all.

"Each nation shall be required to furnish one fully equipped gunboat, airship, cruiser, or battleship to the police fleet of the C. I. C.

"Each nation shall be permitted to maintain one battleship for its own use; but the movements of such, and their purpose, shall be reported to the C. I. C., and may not be undertaken without the permit of the said Body."—Extract from the rules of the Central International Council, in force beginning May 8, 19—

STUDENT

THE churches, as churches, have not waked up. They are still dallying with symptoms; offering classes and gymnasiums to people who are underfed and underpaid, who live in miserable and unsanitary homes! They wonder why revivals of the sort of religion they preach do not attract the multitudes. They devote tremendous energy in attempting to suppress vaudeville shows while hundreds of thousands of women and children in New York are being degraded body and soul by senseless exploitation—too much work, too small wages, poor homes, no amusement. They help the poor child and give no thought to the causes which made him poor. They have no vision of social justice; they have no message for the common people. They are afraid to face the world "without purse or scrip"; they have no faith. And without such vision how shall they reach the hearts of men?—Ray Stannard Baker, in the June *American Magazine*

Some Views on XXth Century Problems

The Restoration

THE streak of the old theology is in even the best and wisest of modern speculation, hindering that practical treatment of his consciousness by which the speculator might pass to knowledge. I have a soul; therefore I *am* something else: the first phrase is the teaching of the church; the second is the deduction consciously or unconsciously drawn by every acceptant of it; the two make the centuries-old block in man's path to knowledge.

People are talking about Mr. Dickinson's recently published fine and tender essay, *Is Immortality Desirable?* He has almost dismissed the old theological conceptions of heaven and hell from his thought; he has almost cleared his vision — but not quite. His definition of heaven is:

the ultimate term of a process in which we are engaged, but of the end of which we can only say that it is good.

Immortality is desirable because that ultimate good can only be reached through extended time. As the good is infinite, the time must be eternity. But the word eternity has been nearly ruined by the finger-marks of the old theology.

I find then, that, to me, in my present experience, the thing that at bottom matters most is the sense I have of something in me making for more life and better. . . . I do not know what this is. . . . I will abandon, if necessary, under criticism any particular terms in which I may try to describe it; I will abandon anything except *Itself*.

"Something in me" — there is the theological streak. In that case I am outside that something; I, in fact, am some philosophical equivalent of the theological "groveling worm."

Why not try another statement? It is *I* who am beginning to yearn for more life and better. Whatever has life struggles for *more* life; my appetites struggle for more life; but for *me* their victory will mean less life and worse. My feeling and even my thought may rise up against me and overpower my intuition. Self, embodied, is in the clutches of many powers which, until dominated and made instruments, may be enemies. Self, in the old symbol, is the diamond that fell flashing, from the sunlight into the earth — and flashed no more. But it had been dowered by the Father Sun with the power to fuse the dark earth into transparence so that it could again receive the white ray. It could not however use the power until it had remembered itself and no longer thought of itself as the earth about it.

Whoever awakes to himself will find immortality not only desirable but necessary and obvious and of the very nature of restored self-hood.

STUDENT

The Three Souls

FROM time to time we read newspaper accounts of the feat of some surgeon who, operating upon a naughty child's brain, raising a depressed fracture or removing a bony thickening, alchemizes therefrom a good child.

Good and bad dispositions are "therefore" the effects of physical conformation. Charac-

ter is a necessitated product of conformation; we cannot help ourselves; the word responsibility means nothing. If the bicycle wheel is out of true the course must be crooked; straighten it and the course will straighten. Naughtiness and villany are a few brain wheels out of true.

But with a little care the bicycle rider, knowing the failing of his wheel, can still keep a straight course. With a little care a man can keep his temper notwithstanding that his great toe joint is filling up with uric acid or his liver declining to function. Both feel the added difficulty they have to contend with and put more will or care into the matter.

Find the extreme degrees. Here is a circus man who can take his front wheel off the ground altogether and ride on the back one. Here is an invalid who against all failings and even agonies of her physiological machine, holds a saintly serenity that is a benediction to everyone about her. As conscious of it all as the rest of us would be, she does not let it affect her.

Would it be possible to hold self so firmly that even the *death* of the machine would not disturb the serenity of consciousness or break its thread? Only he could be sure who had practised the art of self-holding as the circus man has practised the art of riding on one wheel.

The word soul always needs an adjective. When Haeckel uses it he means the physiological consciousness, that consciousness which is ill-tempered when its body has gout, which is as a unit extinguished when its body dies. In other use it means the common human self, ordinarily taking color from the physiological soul, dominated in feeling by that, serene or perturbed by that; yet, as in the case of our invalid, capable of holding its serenity against any perturbation of that. In yet other use it means the divine self, felt as a sacred presence and inspiration by those who wish to, and by all men as conscience.

So we need some such three adjectives as animal, human, and divine, to distinguish the three. The materialistic case rests on the fact that the second is usually dominated by the first. If theology had not left the third without description and confused the first and second, there would never have been any materialism.

STUDENT

The Limits of Eugenics

IF you add a teacupful of blue-dyed water to another of the same, you will not get one teacupful of water doubly blue but two of the original blue. Which fact is worth bearing in mind in connexion with the proposals of enthusiastic eugenicists. Mr. W. I. Thomas reminds us in a contemporary that

Alfred Russel Wallace has stated a view — which is at the same time a popular though certainly a mistaken one — that it is possible by the selection of stock to produce a race from which the old Adam is eliminated, whose disposition resembles that of angels and whose intelligence approaches in absoluteness that of the deity.

More cannot be brought from heredity than is there. But how much is there? Nordau,

in a communication to the Eugenic Society, gave part of the answer to Wallace:

Actually every European nation represents a mixture, different in *proportion* only, of all the races of Europe and probably some of Asia and Northern Africa. Probably every European has in his ancestry representatives of a great number of human types, good and indifferent ones. He is the bearer of all the potentialities of the species. . . . Place him in favorable conditions and there is a fair chance of his developing his potentialities and of his growing into resemblance with the best of his ancestors. The essential thing therefore is not so much the selection of particular individuals (every individual having probably latent qualities of the best kind) as creating of favorable conditions for the development of the good qualities. Marry Hercules with Juno, and Apollo with Venus, and put them in slums — their children will be stunted in growth, rickety and consumptive. On the other hand, take the miserable slum dwellers out of their noxious surroundings, house, feed, and clothe them well, give them plenty of light, air and leisure, and their grandchildren, perhaps already their children, will reproduce the type of the fine tall Saxons and Danes of whom they are the offspring. Eugenics, in order to modify the aspect and value of the nation must ameliorate not some select groups, but the bulk of the people, and this aim is not to be attained by trying to influence the love-life of the masses. It can be approached only by elevating their standard of life. Redeem the millions of their harrowing care, give them plenty of good food and rational hygienics, and allow their natural sympathies to work out their matrimonial choice, and you will have done all the eugenics that is likely to strengthen, embellish and ennoble the race. In one word: Eugenics, to be largely efficient, must be considered not as a biological, but as an economical question.

But if in the germ plasm we have all these fine physical possibilities lying latent, waiting only for the condition of their manifestation, what about the higher mental and spiritual?

When we compare the supreme musician and poet as they are in common life and at the table with the same selves as they are when the intense light of inspiration is upon them, we can get some idea of the latent possibilities of all human natures. The musician and poet know that within them is something far beyond their complete expression; that it is the *expression*, the expressing apparatus, that is the limited quantity, not that which is to be expressed, not that from whence the fire proceeds. The ordinary man is the same, and all other divine things, within; but the expressing apparatus is too crude to let anything through. There is no need to light a fire; a fire is there already. The sole problem is the education of all that part of the individual which can be educated, body, mind, heart; the rest will take care of itself. We know in good part what the physical environment and physiological conduct should be to grow the healthy body. We have yet to learn the mental environment and conduct to secure the healthy mind. Still more have we to learn the special environment — this time spiritual — we must provide, and the special conduct — this time of feeling and thought — we must encourage and teach, to secure the healthy "heart." When we have got them the fire will be visible in every man. Truly, when the Teacher of Theosophy is looked to, humanity can be remade after the ideal in two generations. The gold is still present.

THE LINES OF LE MENEC, CARNAC, BRITTANY

The Lines of Le Menec

OF the three groups into which the alignments of Carnac are divided that of Le Menec is the most important. It contains 1169 menhirs, or monoliths, 70 of which form the remains of a cromlech, whilst 1099 are arranged in 11 parallel lines.

The total number of menhirs in the three groups is 2813, and they extend over a distance of 4 kilometers. But it is conjectured that they originally extended for double this distance, and of course those now remaining form a very small fraction of the original number. Wholesale destruction is known to have gone on since the 16th century, when a reliable account placed their number at over 15,000; and it is certain that these monuments had not passed unscathed through the many previous centuries.

The parish church of Carnac is entirely built of stone derived from megalithic remains; for the meaningless and extravagant baldachin crowning the porch some of the finest menhirs of the district were cut to pieces; for the five stone altars the capstone of dolmens were used. For many other constructions in the neighborhood stone was obtained from the same source; and menhirs and dolmens were even broken up for mere road metal.

However, thanks largely to the efforts of James Miln, who devoted a considerable part of his life and fortune to archaeological research in this neighborhood, interest in these prehistoric remains was at length aroused, and eventually the State stepped in and became the

proprietor of all the more important megalithic monuments. Further destruction or defacement was definitely prohibited, under pain of heavy fines or imprisonment; and it seems that the law is respected, and little vandalism now takes place. Besides taking the monuments under her protection, the State has possessed herself of small spaces of ground surrounding them and keeps these spaces cleared up; where necessary, she has also built walls and steps. Considering the great difficulty of preserving such scattered ruins, the French Government deserves much credit for its firm attitude and decisive measures.

Whether the average tourist derives much profit from visiting these monuments is another question altogether. He probably of course accepts the pseudo-scientific theory that

The dolmens and allées couvertes were sepulchers, family or tribal; and the alignments consist of stones erected by members of the tribe or families belonging to the tribe in honor of the several dead who were laid in the dolmens. The stone circles were either places where the dead were burned and funeral feasts were held, or were places of tribal gatherings for palavers; generally they served both purposes. Isolated menhirs were either memorials to the dead, or boundary marks between tribal lands. (*Brittany*, by S. Baring-Gould—a Reverend authority.)

If the tourist thinks at all about the manner in which such huge blocks of stone were quarried, moved, and raised, by the rude savage of the Stone Age, he is perhaps satisfied with the scientific explanation (?) that it was all done by inclined plane and lever.

But that not every traveler accepts such theories is amply proved by the following extract from Mr. Francis Miltoun's recent book *Rambles in Brittany*:

Of the Lines of Carnac, as the strange population of tombstone-looking monoliths is known, much has been written by antiquaries, archaeologists, and geologists ever since the tide of travel set this way. What these stones actually mean—some thousands of them in all, set out in regular rows—only a vain presumptuous person could answer. They offer a prospect of strange grandeur, for they really are grand, if not stupendous, and, as they stretch away in long, silent lines almost to the horizon, they are as phantoms looming today out of the mysterious past to which they belong.

To understand such monuments we must first overcome a few deeply-rooted prejudices. First come our historical prejudices. These are founded partly on biblical ideas and partly by our ignorance of our own past, due to the barbaric habits of our ancestors. But every day sees an increase in the evidence for the existence of great civilizations in the past. Then there are our religious prejudices, which cause us to regard ourselves as God's chosen people, and other peoples as heathen; and our scientific prejudices, by which we consider our own newly hatched and ever-changing science as the acme of knowledge.

These silent witnesses of an immense antiquity and a stupendous power, exist in many lands, pointing to a united purpose among their builders, which purpose we cannot fathom in the present state of our knowledge. The key to such problems is a study of the Wisdom-Religion of antiquity. STUDENT

✻ The Trend of Twentieth Century Science ✻

Chamber Echoes

THE experimental work of M. Gustave Lyon on chamber echoes, to which we have already made some reference, should be studied as well by public speakers as by hall builders. For the first time the relation of echoes to clear audition has been established.

Suppose that the average speaker makes 120 words per minute, 2 per second, say 6 syllables. If an echo from the roof should reach the hearer one-sixth of a second after the syllable had reached him, this echo would exactly overlies and blur the next syllable. If the echo were one-twelfth of a second after, it would overlies half the next syllable or as much less than that as the pause between the syllables measured. Most ears would in that case fail to hear it as an echo, taking it as part of the original sound. But if the interval were one-tenth of a second, the echo would be clear and disturbing. M. Lyon has established that for clear audition it should not be more than one-twentieth. During one-twentieth of a second sound has traveled 56 feet. If the speaker on the platform, the hearer, and the reflecting-point in the roof, make an equilateral triangle of 56 foot-side, the speaker's syllable will reach the roof and the hearer at the same moment; reflected from the roof to the hearer, it will reach him as an echo one-twentieth of a second later. If the echo reaches him in one-fortieth of a second, "the audition is warm, colored, enveloping; this zone is that of the *reinforcement* necessary for good hearing." If one-thirtieth of a second, "there is still for the sound, as heard, a useful degree of reinforcement." From that to one-twentieth of a second, the reinforcement is "tolerable." After that, echo begins to be noticed as a blur. It would seem therefore that *some* echo, coming quickly enough, is desirable for the enrichment of the tone.

The source of the echoes was determined on the principle that the angle of incidence of a sound upon any surface is equal to that of reflection. The floor of the great Trocadero was divided into spaces of six feet square. A sound was made on the platform, and the hearer standing in that one—or the hearers in those—of the spaces who got an echo, said so and gave the number of his square. The points of echo were thus finally located and covered with two layers of cloth hanging, about an inch apart.

M. Lyon notes that the ancient theaters had no roofs, and that great concave niches near the stage, which might have proved sources of echo, were filled up with amphorae, making them convex. STUDENT

Copper and Cholera

THE epidemic of cholera in eastern Europe has recalled attention to the curious *copper* preventive. The workers in copper mines have never taken cholera. Those who, in the last-century outbreaks of it, wore a plate of this metal, remained immune. Hahnemann regarded it as a certain protective. And quite lately its powers have been re-

lauded, after much study of the evidence and some personal experience, by Dr. J. Cavendish Molson. A thin disk, an inch or an inch and a half in diameter, is suspended from the neck and allowed to be in direct contact with the skin of the abdomen. It must hang free; bound immovably to the skin it would induce ulceration. Perspiration dissolves an exceedingly minute but real amount of it, but the spectrum of the blood has not yet been examined for its detection.

How does it do its work? No one knows. A solution of it sufficiently strong to be fatal, in however long a period, to the cholera germ, would be equally fatal to many others; but copper used as for cholera has never been noticed to protect against any other disease.

The fact has been known for say fifty years. Suppose that some serum or anti-toxin were discovered which, tested in a severe epidemic of cholera, never once failed to protect and whose administration never once caused a second's uneasiness. All the medical journals would be talking about it; the whole body of medical experimenters would be studying its properties and trying to learn far-reaching lessons from it. Why is not copper similarly favored? During a recent outbreak of yellow fever it was demonstrated that arsenic stood in nearly as perfect a preventive relation to that disease. Both facts have been practically left alone. Some years ago an English physician, Dr. Illingworth, gave results of his own treatment of diphtheria with the biniodide of mercury, as favorable as any of those reported of the present anti-toxin treatment. His facts also lie unnoticed on the shore. The animal extract craze is blunting the medical mind, estopping it from the richly promising fields of thought and research. STUDENT

The Stellar Program

RECENT researches in astronomy make it quite clear that the stellar universe is by no means sitting still. Every star is actively engaged in its own business, moving from somewhere to somewhere. The stargazers of 50,000 years ago saw different configurations from those presenting themselves to us. Our earth goes round the sun every year. But it will not be, on the next 21st of June, where it was on the last. It will be where it never was before, for the sun, carrying its planets, is moving towards Vega.

The present position of the stars is obvious. In the case of a few, not more than a hundred, it has been possible to determine their distances. The study of old catalogs, dating not farther back than two or three centuries, has shown slight changes of position, in one case of an amount equal to about the diameter of the moon. Where the distance is known, and the rate of change of position also, the rate of motions is easily calculated and has hitherto come out at somewhere between ten and twenty miles a second across the line of sight. The spectroscope has also revealed similar rates of motion *along* the line of sight.

What is the deeper change underlying this

continuous change of place? We can only answer our question by an analogy. Thinking of the universe as a whole, there must be change of property with change of internal disposition of parts; and change of property means change of consciousness—for those who think, who cannot but think, that the universe is conscious. And this change immeasurable and inconceivable, must be evolution, a passage from a lower or simpler level to a higher and more complex.

We can think of the atom as a universe, or of the universe as an atom. The old Hindûs did indeed call Brahman—the universe considered as consciousness embodied—an atom. The properties of an atom change with the disposition of its constituent corpuscles; of a molecule with change in that of its constituent atoms; of a group with that of its molecules. Why should not we try to press the analogy? STUDENT

The Future American

SOME studies of race intermixture, made by Professor Boas, strongly suggest that the laws applying to animals and to man are not identical. The Mendelian rule for the former appears to have a very limited application to the latter. The problem is, however, as he says, as yet unsolved; and facts lie on both sides.

According to Mendel's law for animals and plants—often, however, invisible even in their heredity—the product of parents of diverse types will be offspring of mixed types; but as these offspring in their turn intermingle in successive generations, the original parental types tend to reappear in original purity.

As respects man, von Luschan found that in a certain district of Asia Minor, where two diverse types co-existed, there was likewise an alternating and separative inheritance, the progeny resembling sometimes the father, sometimes the mother, with a minimum of blend. Professor Boas found the same in other cases. But he adds:

However, the observations on mixtures of Indian and white have shown that while alternating inheritance may be found in regard to such traits as the form of the head and face, the development of the bulk of the body follows different laws.

On the other side is another observation of his, relating to cases where the choice of mates is left solely to accident:

I have made this calculation; and I find that in a population in which the two types intermingle, and in which both types occur with equal frequency, there will be in the fourth generation less than one person in ten thousand of pure descent. When the proportion of the two types is as nine to one, there will be among the more numerous part of the population only eighteen in one thousand in the fourth generation that will be of pure blood.

The bearing of this upon the development of a national American type, modified by as yet unrecognized but very real subtle influences from the far remote American prehistoric past, a past of which science as yet knows almost nothing, is obvious. The Indian is this end of a descending line. The other end is out of sight. STUDENT

The Creators in Nature

IN a review of a recent book containing the life-work of a naturalist, it is stated that the author was a firm believer in the existence of a logically-minded Creator. The design, order, and purpose to be found throughout Nature could only have been produced, he thought, by pre-determination in the mind of an *original Creator, working a pre-arranged scheme*. Apparently he imagined that the Creator is not working now, for he speaks of him as "original," and of his scheme as "pre-arranged"; and this leads him to the inference that plants and animals are modeled on certain central types to which they invariably return after temporary deviations caused by accidental circumstances.

It is evident that the author thought himself obliged to choose between the theological conception of a single personal deity and the mere negations of a certain school of scientists; and of the two theories of Nature he has certainly selected the better. But it is equally evident that had he not been prejudiced by the theological idea of the deity, his observations and inferences would not have led him to such a conclusion; or rather, perhaps, they would have led him much farther.

The marvelous works of Nature do indeed prove the operation of intelligence and purposeful action. But they indicate the existence of *many* minds, *many* craftsmen. In a large number of cases, in fact, these craftsmen are actually visible to us and we see them at work. Take bees, for instance; if the naturalist came across a nest with combs, would he attribute it all to the direct unaided operation of a universal deity? Would it be reasonable to ignore the existence of the bees? On the contrary, he would admit that the bees designed and created the fabric and that they were intelligent living creatures. In the same way we might argue the case of any other living creature and its work, coming finally to the case of man. If the naturalist should come across a city, would he call that the unaided work of God and ignore the existence of men? In short, he would admit that in all these cases, the Universal Spirit, the Supreme Cause, works through agents in whom he enshrines a portion of his intelligence and creative power.

But are we logical in limiting the number of intelligent creators in the universe to those alone which our present faculties enable us to see? Such a conclusion would be most unreasonable; for we know that the senses of man are limited and that there must be whole worlds of Nature that escape their ken. Consequently the conclusion is irresistible that Nature is peopled with intelligent creative beings which we do not descry, and that these beings, like the visible ones, are the agents of the Universal Spirit and contain a portion of Its power.

This is the only logical theory of Nature, for it is inferred logically from the facts of

Lomaland Photo. and Engraving Dept.

THE CONE OF VESUVIUS. THE ROAD LEADS TO THE OBSERVATORY

O DREAD and silent Mount! I gazed upon thee,
Till thou, still present to the bodily sense,
Didst vanish from my thought: entranced in prayer
I worshipped the Invisible alone.

Yet like some sweet beguiling melody,
So sweet, we know not we are listening to it,
Thou, the meanwhile, wast blending with my Thought,
Yea, with my Life and Life's own secret Joy:
Till the dilating Soul, enrapt, transfused,
Into the mighty Vision passing—there
As in her natural form, swelled vast to Heaven!

Coleridge

experience. We may take man himself as a miniature copy of the universe; and there we find that he has a multitude of organs and faculties under the control of a total master intelligence. But the supreme mind and will of the man do not interfere directly in most of these processes; the processes go on of themselves, directed by their own separate local intelligences; the man does not consciously direct his own digestion and respiration. Analogy would indicate that this is the rule in Nature; and that though all the universe is under the governance of a Supreme Power, that Power does not intervene directly in the details, but has delegated Its functions to innumerable beings. And we can infer that the creators are at work all the time, and thus avoid the idea that the universe is a kind of machine wound up to go.

If such questions be asked as: Who are the creators and where are they? the answer must be, that though the solution is beyond the reach of religion or science as at present constituted,

it is not beyond the legitimate sphere of knowledge. It belongs, in fact, to the domain of a higher science than we as yet know; it involves the use of higher faculties than the average man has yet developed. Our outer senses discern only the physical aspect of Nature, and we see things coming into visibility from an invisible source. But there are senses that can discern those invisible kingdoms; and when those senses are unfolded in man, he will be able to see where the designs and models of the plants and animals are stored and who it is that molds them. But before man can be admitted to the sanctum of Nature he must have the pass-words of purity and absence of covetousness. He must learn how to *command* Nature. At present, instead of commanding it, he yields feebly to some of its lower forces—the forces of animal desire, the attractions of the senses. The result is that all his faculties remain gross and he is shut out from knowledge. Hence the purification of man's nature is the first step on the path to knowledge; hence, also, all attempts to invade Nature's sanctum by force are foiled.

The countless evidences of design in Nature indicate the presence of countless designers; and we realize that there is a fathomless ocean of knowledge before man, awaiting only his fitness for attaining it. How paltry do the domains of physical science and of dogmatic religion seem by comparison with such a prospect, and what an inadequate basis they afford for dogmatizing upon the ways of Nature, the "plans of Providence," or the destiny of Man!

STUDENT

Students'

Path

**The Principal Purpose
of the
Universal Brotherhood and Theo-
sophical Society**

PART II

MODERN science has been hitherto largely dominated by men who wished to make the universe a mechanical dead thing, attributing the origin of this beautiful and wonderful world to "the fortuitous concourse of blind atoms." While admitting, with grateful appreciation, the discoveries and applications of science — which we maintain are a part of the great, universal, Theosophical, divine liberating movement of this age — the Theosophical student must take exception to the saying attributed to Leibnitz, who "cared for science only because it enables one to speak with authority in philosophy and religion." There is obviously no more sense in that than there would be in saying that one "cared for poetry only because it enabled one to speak with authority on music and painting!"

But it may easily be shown, with the aid of the Theosophical teachings, that even at the lowest, the very attractions and affinities of the "atoms" of science are the expression in the dust of the earth, of the universal law of brotherhood.

Any naturalist and scientific observer must echo the words of Gilbert White of Selborne, written in 1775: "There is a wonderful spirit of sociality in the brute creation, independent of sexual attachment." Darwin remarks that the social animals which stand at the bottom of the scale are guided almost exclusively, and those which stand higher in the scale are largely guided, by special instincts *in the aid which they give to the members of the same community.*

Whatever the scale of being — whether insects, plants, animals, or men — it is universally true that in the degree that they are social — or mutually helpful, or brotherly — all creatures are high in their own scale. Indeed Darwin lays it down as a law that "That community will flourish best which has the greatest number of mutually helpful individuals."

In his *Evolution and Ethics*, Huxley, supposing that nature embodies the "Struggle for Life" and the "Survival of the Fittest," which he calls "Cosmic evolution," urges that man has appeared with a new factor, "Ethical evolution"; bringing ethics to bear in evolution it is man's part *to fit the most to survive.*

In the vegetable kingdom we find that one of the largest, most prosperous, and the most highly developed of the families of flowering plants, the *Compositae*, owe their success to the fact that — as their name implies — they club together for mutual advantage, each "flower" being in fact a whole community of small flowers, of which the outer members have actually given up their individual func-

tions and chance of perpetuation in order to grow the abnormally long petals on the outside so that the community may be advertised to the fertilizing insects in the best possible way. Thus the general purpose is fulfilled even though the individuals who ensure it themselves come to naught. If that were in the human kingdom we would say, "Greater love hath no man than this: that he lay down his life for his friends."

And so we might go on endlessly, everywhere finding Brotherhood the basic fact in nature. It is said, however, that "the eye brings with it the power of seeing." So unless brotherhood is the mainspring and motive of our own lives we shall lack the necessary key to unlock nature's brotherhood. We shall, as it were, lack the pattern by which to judge the great fabric. If the divine light is burning in our hearts we shall see it everywhere. Whitman, above all others the poet of comradeship, sings:

I swear I think now that everything without exception has an immortal Soul.

The trees have, rooted in the ground; the weeds of the sea, the animals have (and all the rocks and mountains have, and all the earth)

I swear I think there is nothing but immortality.

And the Christian apostle Paul declares of those who are enlightened:

For we know that the whole creation groaneth and travaileth together with us . . . seeking for the manifestation of the Sons of God.

It is with these sublime intuitions of the Universal One Life, the universal brotherhood of which we are parts, that we must enlarge and enrich our ordinary consciousness if we would grow out of personal limitations and narrow views; we must begin in ourselves that manifestation of the Son of God which is the life universal as against the personal life. In that height of intuition alone can be seen the real grandeur and scope of the Theosophical Movement, founded on the Theosophical philosophy, which is, in the words of William Q. Judge:

that ocean of knowledge which stretches from shore to shore of the evolution of sentient beings; unfathomable in its deepest parts it gives the greatest minds their fullest scope; yet, shallow enough at its shores, it will not overwhelm the understanding of a child.

One cannot speak here of the deeper aspects of brotherhood in the Theosophical teachings — historical, geological, astronomical, cosmic, physiological, psychological, spiritual — all of which are symbolized in the seal of the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY, where these profound symbols are shown as a pendant to the most obvious and universal symbol of brotherhood, the clasped hands.

But one must notice a superficial objection, commonly met with. Some may say, "You speak of attraction and affinity in the dust of the earth. Very well, that may be brotherhood if you like to make the word so comprehensive. But what about the other half of the law — repulsion? This is also a fact, and therefore un-brotherliness is a fact in nature also!"

Certainly it is, and Theosophy alone offers a rational explanation for it. There is a night side to nature as well as a day side; and un-brotherliness no more disproves brotherliness than night disproves day. All manifestation is dual, symbolized in the Theosophical seal by the interlaced triangles, the black one point-

ing downward, the white one pointing upward. Natural laws universally operate through "pairs of opposites" — day and night, heat and cold, summer and winter, waking and sleeping, attraction and repulsion, pleasure and pain, and so on. Unbrotherliness is a fact in nature because it is the reverse side or negative aspect, the neglect or denial of brotherhood, and therefore absolute proof of it.

As we rejoice in common and win large benefits through the active exercise of brotherliness, so we suffer in common through unbrotherliness; no man can sin, suffer, or sorrow, alone. If men live on the night side of their nature, the very law of brotherhood, making them reap what they have sown, brings a harvest of night, sleep, winter, repulsion, pain, the dark triangle, pointing downward. "Lilies that fester smell far worse than weeds," says Shakespeare; the more sacred a thing is the deeper is the degradation resulting from its corruption. It is "Man's inhumanity to man makes countless thousands mourn," says Burns. Why? Because brotherhood is a fact in nature and the acts of the individual pulse throughout the whole of humanity bringing weal or woe to all, humanity and all creatures.

But let us not be sentimentally pessimistic.

Each good thought or action moves
The dark world nearer to the sun.

Let us not look on the dark side but on the bright side. The *apparent* unbrotherliness in nature is, according to Theosophy, the inevitable result of man's inhumanity, the reflection throughout nature of the unbrotherliness of millions of men through many ages. The manifestation of the Son of God in man will also find its reflection in nature. Nature herself will be reborn with the re-awakening of the divine in man.

In sacred scriptures we may read of the joy that thrills throughout nature when even a single individual attains the goal of Divinity, a goal which in the far spaces of time all the hosts of souls will reach. In *The Voice of the Silence*, written by H. P. Blavatsky for "the few" who have devoted their lives to reach this goal "for the sake of suffering humanity," we read:

Know Conqueror of Sins, once that a Sowani [an advanced pilgrim] hath crossed the seventh Path, all Nature thrills with joyous awe and feels subdued. The silver star now twinkles out the news to the night-blossoms, the streamlet to the pebbles ripples out the tale; dark ocean waves will roar it to the rocks surf-bound, scent-laden breezes sing it to the vales, and stately pines mysteriously whisper: "A MASTER has arisen, a MASTER OF THE DAY."

The old prophecy: "The lion shall lie down with the lamb; . . . they shall not kill nor hurt in all my holy mountain," is another of those divine intuitions of the soul life, a hint of the new order of ages when Theosophy, the Divine Wisdom, shall reign universally in the hearts and lives of men — a universal brotherhood of "the people of the earth and all creatures."

Many more "proofs" of brotherhood than have here been touched upon can be urged by the earnest and alert Theosophical student; but to sum up so far.

We have seen that brotherhood is universally recognized and acted upon in everyday human life, and that therefore on the basis of our common nature and its needs every man is a potential Theosophist; we have seen that the poets, though occasionally pessimistic,

universally teach it; we have seen that brotherhood, with all the divine philosophy that Theosophy teaches through that word, is the key to a truer science which will forever dispel that nightmare of materialism—a dead universe, a “fortuitous concourse of blind atoms,” rushing together by chance, creating, however, worlds of infinite beauty and harmony, though doomed to end in annihilation, in the nothingness from whence they sprang—we have seen that brotherhood is the foundation-stone and key-stone of all religions; we have seen that in animal and plant life, and even in the dust of the earth (as is so beautifully shown by Ruskin in his *Ethics of the Dust*) brotherhood is the condition of success, of fruition, of fulfilment. What remains?

To make brotherhood “a living power in the life of humanity.” Here we leave merely verbal “proofs” and come to a *demonstration* of the fact. This has already, in the very beginning, one might say, of the present Theosophical Movement, been so well realized under the present Leader, Katherine Tingley, that the Theosophical Movement has been well called “the most serious Movement of the age.” In this place, at this time, one has no need to labor the point, and a few words will suffice to conclude with.

With a world-wide organization, whose International Headquarters are at Point Loma, where Theosophy in practice is shown to be the pattern of the new ideal brotherhood life; with its Rāja Yoga Schools and Academies in many countries and many more planned for other countries in the near future; with its grand, all-embracing brotherhood philosophy; led by its third great Leader and safeguarded by its Constitution, the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY alone among the myriad agencies for good in a world at present so unbrotherly, is *teaching brotherhood, demonstrating that it is a fact in nature, and making it a living power in the life of humanity.*

STUDENT

THEOSOPHICAL FORUM

Conducted by J. H. Russell

Question

May it not be true after all that what we often take for intuitive knowledge (for instance the sense of certainty of an after-death life—or lives—and reunion with those we love) is indeed but an echo of our hopes and desires?

Answer

After all, beggars must not be choosers. Let who will write them down as echoes of our hopes and desires; perhaps it comes to the same thing. What is needed is a little study, and less taking things for granted. The implication here is, that they are not after all, realities; that they have no existence, and point to nothing. They do but “echo our hopes and desires”; well then, they do indicate something at any rate; they argue that such hopes and desires are rooted in our being.

Whatever we can find within ourselves is to be found also in the Universal Self beyond our present consciousness. Man is a kind of sample packet, you may say, in which the whole of life is represented; a cosmosynthesis, an epitome of worlds and universe in little. That any of our hopes or aspirations or longings of any kind are false, or rather impossible, chimerical, is hardly to be thought, or not to be thought at all. Desire, properly so-called, is

to be found in man, in one part of man, as seawater is to be found in a sponge; it is not his peculiar and stagnant property, but comes to him from an ocean, and is subject to the ebb and flow of tides cosmical and infra-human.

To that sea the animals do belong; it is for them to take in its waters and be nourished by them; they have to learn desire, and be evolved by the sensuous life. But as for man, he is a sponge in many seas; or rather, he has sponges in many seas. He has one in the sea of animality; were it not so, his evolution would be incomplete, and the lessons of the animal world would remain for him to learn. But he has been there, and has learnt all the good lessons that desire can teach; he has other tasks before him now.

He has a sponge in the intellectual sea. All the furnishment of intellect can come to and go from him. Intellect is not a fixed quality; you are not born with all the knowledge of that kind you may attain. You go on learning and acquiring; although the sponge may be limited as to the amount it will hold, yet its contents were not fixed from the beginning, but there is a flux and reflux. What one man thinks is the possession of all men, or may become so. If this were not so, all books and learning would be totally meaningless to us, and all discoveries impossible.

Harvey did not invent the circulation of the blood, nor Newton gravitation. They did not make them, as a blacksmith makes a horseshoe; they merely *desired* knowledge until their faculties were sharpened to perception point, and they *saw* what had already existed time out of mind. Having seen, they published their vision; which now flows naturally into all minds. They put two drops of intellectual knowledge into that sea in which we all keep a sponge. That we have intellectual leanings argues a thing called intellect in us, and a world of intellectuality outside of our individual selves to which we may give, and from which we may draw. Human intellect is not a closed and watertight box, with *meum* and *tuum* stamped on its contents; there is a world or plane of being called the intellectual, in which we acquire greater or lesser rights of harvesting.

A man may have withdrawn his sponge from the animal sea; then we say he has conquered his desires, and account him a hero because it is not in those waters that we have any right to being. Or he may have worn out his sponge in the sea of intellectuality and be an idiot, cut off from the reaping of mental experience for the time being. Often enough his imagination sponge is kept dessicated away in some lumber-room of his being; wrung out and stored away in the “education” time and never permitted the renovating moisture since.

Again, a man may say “I am an animal; witness these desires, which are myself.” To which standard he may live down for a number of years, until at last you can only agree with him: “Very well sir; you are a proof of your own theory, so far as you yourself are concerned.” That man will be certain of one thing: that there is no soul nor divinity in connexion with him. All traces of it will vanish; generosity and all high feeling will disappear, imagination will be relegated to the kitchen, busy with the what-shall-he-eat and what-he-shall-drink aspect of things. Animal-

ity will flow into him from all sides, submerging the whole landscape of his humanity. For a time he will be animal plus intellect; then intellect will go, and though still human in form, he will be at one with the beasts that perish, brother to the tiger and the pig, but baser.

Or he may say “I am an intellect; animal desires are a hindrance, and soul there is none; let me strive for myself and acquire learning and power.” Let him speak for himself solely; soul for him, indeed, there will be none, soon enough. He has united himself with a cold hard shell of a world; his hopes and desires have gone out to the place where they belonged, and dragged his being after them.

There is an animal in man, which, if he gives play to its desires, becomes himself and all that there is of him. That he has such desires is proof of its existence. There is an intellect in man, which, if he gives play to its desires at the expense of all else, becomes himself and all that there is of him. The doctrine of the animal is: *Let us eat and drink, for tomorrow we die.* True enough, so far as the animal is concerned; tomorrow, or on some tomorrow, that animal will die and be forgotten. The doctrine of the intellect is: “There is no proof of any existence higher than myself; I have no responsibility to any existence outside of myself; give me my own desires now for I have nothing to do with eternity.” Nor has it, being merely a thing of one life.

But there are other hopes and desires, as you say; there is that which believes in immortality and all noble ideas. Can we not concede at least as much to it as to our passions and intellect? We have no hopes nor desires impossible of fruition. That which desires immortality is immortal. How could we conceive of the idea of immortality unless there were something of that nature within us?

We find something within us that knows animal being; we know something within us that knows intellectual being. We find something within us that knows immortal being. The first is the animal self, which a man has; the second is the intellectual self, which a man has; the third is the soul, which a man verily is. It needs no proof, because all certain knowledge is inherent in it. If we wish to know, we have to unite ourselves with it, subduing the animal with its craving after comfort and delight, and the intellect, with its doubts and fears and selfishness. STUDENT

THIS is a great wheel that ever revolves, and no man can stop it. To imagine we can escape from any cause connected with us is to suppose that law and order desert the manifested universe. No such divorce is possible. We must work everything out to the last item. The moment we evolve a thought and thus a cause, it must go on producing its effects, all becoming in turn causes for other effects and sweeping down the great evolutionary current in order to rise again. To suppose we can stop this ebb and flow is chimerical in the extreme. Hence the great sages have always said we have to let the Karmic effects roll on while we set new and better causes in motion, and that even the perfect sage has to endure in his bodily frame that which belongs to it through Karma.—William Q. Judge

THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY

FOUNDED AT NEW YORK CITY IN 1875 BY H. P. BLAVATSKY, WILLIAM Q. JUDGE AND OTHERS
REORGANIZED IN 1898 BY KATHERINE TINGLEY

Central Office Point Loma California

The Headquarters of the Society at Point Loma with the buildings and grounds, are no "Community" "Settlement" or "Colony." They form no experiment in Socialism, Communism, or anything of similar nature, but are the Central Executive Office of an international organization where the business of the same is carried on, and where the teachings of Theosophy are being demonstrated. Midway 'twixt East and West, where the rising Sun of Progress and Enlightenment shall one day stand at full meridian, the Headquarters of the Society unite the philosophic Orient with the practical West

Religion Day by Day

Science Surpasses Christ's Miracles

A COLLEGE president is reported as having preached from the text:

Verily, verily, I say unto you, He that believeth on me, the works that I do shall he do also; and greater works than these shall he do; because I go unto my Father.—*John*, xiv. 12,

—and to have said that the achievements of modern physicians, engineers and physicists have fulfilled this saying. The change of water into wine by Jesus may be compared with the irrigation schemes of the West, by which water is changed into lemons and squashes; and walking on the waves, as Jesus did, is too slow in the days of wireless telegraphy which speeds ships to the rescue of vessels in distress.

This can hardly be regarded as a satisfactory reading of the text; it is an indiscreet utterance which involves a good deal more than the author would probably be willing to stand for. For instance, it implies that we have achieved these scientific successes by virtue of our belief in Jesus; does the preacher mean to say that? One tries to imagine the great pioneers of irrigation inspired by the fiery words of some preacher and going forth into the desert with Bible in one hand and transit and level in the other—but one fails. Nor is one more successful in the attempt to realize a picture of the chaplain on board a ship superintending the sending of wireless telegrams for aid, and the praying crew of the relief ship roaring anthems to the sky as they speed to the rescue. The physicians and surgeons do not make much parade of their faith and divine inspiration, but seem in many cases to regard vivisection as the principal means to which they are indebted for their valuable discoveries.

The words quoted from St. John seem to describe the teachings of a Master of Wisdom, who was preaching the innate divinity and perfectibility of man, illustrating his teaching by the wonders he performed, and trying to make his hearers understand that all men have the same power and need only to develop it. His message was the old one—that man is held in bondage by his senses and passions; that, so long as he remains in that bondage, he is a feeble impotent creature; but that, by throwing off that bondage, he can become powerful and wise. And the way to

MEMBERSHIP

In the Universal Brotherhood and Theosophical Society may be either "at large" or in a local Branch. Adhesion to the principle of Universal Brotherhood is the only prerequisite to membership. The Organization represents no particular creed; it is entirely unsectarian, and includes professors of all faiths, only exacting from each member that large toleration of the beliefs of others which he desires them to exhibit towards his own.

Applications for membership in a Branch should be addressed to the local Director; for membership "at large" to G. de Purucker, Membership Secretary, International Theosophical Headquarters, Point Loma, California.

escape the bondage is to eliminate all selfish motives from our conduct, for selfish attraction and repulsion is the great force that binds us. By thus abandoning the motive of self-interest and identifying ourselves with the interests of the whole, we step out upon a higher plane and become Masters as Jesus himself was. The world would be glad to see the modern representatives of Christ's apostles exhibiting a similar holiness and power, because then they might have more faith in Christianity and be readier to support the churches; but the pulpit manifests the lack of its true *knowledge* by its failure to realize the promise of its Master. Can it be possible that the churches do not possess the real teachings of Christ, but are only offering a feeble imitation?

What Church Would Jesus Join?

ANSWERING the question, "What church would Jesus join if he were in New York?" a preacher said he did not believe that Jesus would join any. He would not be orthodox enough, and they would not let him in.

True; the Jesus of contemporary life would be very different from the Jesus of ancient tradition. The former is an individual, very much alive and strenuous; the latter is an ideal, representing various mild and not too exacting standards of piety. The former would be a molding force; the latter is a plastic figure ready to take any form we choose to give it.

To talk about Jesus being here today is a good deal like talking about the dead being alive. If the dead were alive, they would not be dead; and if Jesus were here today, he would not be "Jesus." That is, he would not be connected with any of the ideas or institutions for which that name now stands. He would not be connected with the prevailing religions or their churches, any more than the Nazarene was so connected nineteen centuries ago. He would be regarded now, as then, as an opponent of religion. He would be looked

on by most people, who might chance to hear of him, probably as a renegade, a revolutionary crank, an impostor. He would not be popular. "Christianity" would be the last thing with which he would be likely to identify himself; though doubtless he would strive to reform that along with other institutions.

In short, one fails to see just how Jesus, if he were here today, would behave any differently from the way in which H. P. Blavatsky, the Founder of the Theosophical Society, behaved. H. P. Blavatsky came as a messenger from sources of which she claimed to be the humble instrument; bearing a message of Truth, Light and Liberation for humanity, which she declared to be an old doctrine. She aroused the antagonism of all the comfortably settled leading lights and all the different forms of orthodoxy, whether called religious or scientific. She suffered persecution, even to the death. She was despised and neglected; slandered by enemies, betrayed by friends. After her departure, an attempt was made to found a kind of religion upon her teachings and authority, as appears to have been done in the case of Jesus; but this time the attempt has been frustrated by faithful disciples who carried on her work in its true spirit. In fact, we have not so far to look after all, for a present-day analogy to the case of Jesus. But perhaps it may be advisable to state definitely, to prevent mistakes, that no Theosophist either asserts, or wishes to imply, that the actual Jesus ever has or ever will appear again.

Abbé Loisy on the Science of Religions

THE Abbé Loisy, who has been appointed to the chair of the history of religions at the Collège de France, delivered his opening address recently. He said that, behind all the myths, cruelties, fanaticism, inertia, and reaction which disfigured the progress of religion, lay the aspiration of humanity towards the ideal of a well-ordered society and of a satisfied conscience. He met the question, Why should we study false religions when we have the true one? with the answer that people know their own religion badly when they know no other. The science of religions can serve no end of a special theology, and special theologies are incompatible with the science of religions.

(CONCLUDED ON PAGE 11)

KATHERINE TINGLEY SPEAKS AT ISIS THEATER

LAST Sunday evening the Isis Theater was filled by an audience who followed Katherine Tingley's address with the closest attention and frequent applause. At its conclusion she was enthusiastically recalled to the platform. The music, rendered by the Point Loma Orchestra, consisted of Mendelssohn's *Fingal's Cave Overture* and Kretschmer's *Coronation March*. The following condensed report is from the *San Diego Union*.

Justice from Cuba or U. S. Will Act—Katherine Tingley

Confidence that justice will be done by the Cuban government to the interests in Cuba of the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY, that have been made the subject of attack by two newspapers on that island, was expressed by Mrs. Katherine Tingley in an impassioned address delivered last night before a large and representative audience at Isis Theater. Additional interest was lent to the occasion by the presence in the audience of the Hon. C. Barranco, chancellor of the Cuban Legation at Washington, who is here in compliance with the demand made by Mrs. Tingley that an investigation be made as to the treatment of the Cuban pupils now attending the Raja Yoga school at Point Loma.

That Mrs. Tingley has the sympathy of leading citizens of San Diego in the present controversy, was shown by the presence in the theater of Mayor Conard, Senator L. A. Wright, U. S. Grant Jr., Captain J. L. Sehon, H. E. Doolittle, D. C. Reed, W. W. Bowers, Dr. and Mrs. Mayner, Mr. and Mrs. A. G. Spalding and other representative persons.

Mrs. Tingley commenced her address by stating that in spite of the attacks made upon the Theosophical Movement, most of them by hidden enemies, it was showing tremendous gains, especially in the last three or four months. This growth and development was especially noticeable along the highest intellectual lines. The teaching of Madame Blavatsky was the direction in which great scientific minds were inquiring. This is manifested in leading scientific publications—those of Europe much more than those in the United States.

Menaces Selfish Interests

But Theosophy's demand for purity of life and altruistic thinking and acting, the speaker declared, caused it to reveal the rotten places in a nation and to menace the selfish interests of those whose doings cannot bear the light of day. "Even men wearing the frock of religion show themselves ready to tear down the best in life, if it threatens to interfere with their organizations, and our work has interfered with great organizations all over the world."

"So Cuba—the real Cuba as represented by her best people—should not be blamed for this last lying, sickening attack by a little sheet that would not be worthy of notice but for the forces that were operating from behind a curtain and that must be dragged out into the light."

"Theosophy is always willing to hold out a helping hand to the erring mortal, the failure in life's battle, but it can have no mercy on hypocrisy. Christ was meek, but he was not slow nor gentle in getting after those money-changers that were polluting his temple, with his whip of cords."

Confident of Victory

"These latest enemies of the truth will be unveiled and defeated, as were Otis in Los Angeles and Gerry in New York and the clergymen that were behind Gerry."

"The honorable people of Cuba are as much incensed over the horrible conspiracy and scurrilous attack on an institution that stands only for the uplifting of poor children, as are my best friends here, and according to the cables I am receiving they are watching the proceedings in absolute confidence of victory."

"These cables tell me that our superintendent in Cuba, the man who did most to establish our school on San Juan Hill, has demanded that the editors who served as catspaws in this plot be brought to trial. Several of the children at our school were put on the witness stand. But our enemies profited but little by that."

"The first child testified that desperate efforts had been made to induce her to say certain things about the school, but that she refused, although repeatedly importuned. This child declared from the witness stand that the school had been a great blessing to her; that she was treated just as well as were pupils for whose tuition as much as \$1000 and even \$1700 was being paid. The second child called to the stand said practically the same thing."

"A young boy was the next pupil to testify, and he said that he had also been importuned to say what was false, and even told that he would be prevented from getting any position unless he complied, but still he refused to speak against the school. So that this paper has received no support up to date."

"Concerning the second and more influential sheet that printed the attack, there is more danger of injustice, perhaps, for today I received a cable stating that President Gomez has appointed the nephew of the editor of the newspaper in which this filth was published, to take the place of the judge before whom this case was to have been tried."

"This shows how anxious and nervous are the people behind the scenes at finding the situation is being met and coped with in the spirit of truth."

Predicts Ultimate Victory

"In spite of this fact and the defects of all human law—in Cuba as in all other countries—I believe that this trial will result in a great victory. It certainly will result thus unless there is deliberate perversion of justice."

"If justice is not done, however, we shall test the ability of the United States government to protect its citizens. The superintendent of our school there, while English by birth, is an American citizen."

"Great pressure has been brought upon me to drop this work in Cuba that consumes so many thousands of dollars every year, and so much valuable time and energy. But my answer is 'No!' Cuba shall have her opportunity and this will but result in my redoubling my activities in behalf of her poor people and of spending more thousands in pushing my work there. I said that I would take no further action until I had seen the Cuban Minister at Washington. My complaint was lodged with President Taft and after being made a matter for consideration at a cabinet meeting, was referred to the department of commerce and labor for adjustment."

Blames Local Clergymen

Further along in her address, and while pointing out that error, injustice, vice and immorality were as firmly entrenched in the United States as in Cuba or any other country, Mrs. Tingley said that one should be slow to sit in judgment upon anyone.

"Why," she declared, "two of the former frocked clergymen of your churches of San Diego were among those behind this lying attack. They stood up in their pulpits on Sunday as the representatives of the holy Christ and spent the rest of the week pushing this lying attack through their missionaries in Cuba."

Mrs. Tingley then proceeded to talk along the general progress of the Theosophical Movement, and said that the truth would spread until the whole world was brought under the beneficent sway of the truth which should make all men free.

Religion Day by Day

(CONCLUDED FROM PAGE 10)

The claims of the Latin Church cannot survive the diffusion of true education; will not a knowledge of history make them ridiculous? What we have hitherto been pleased to call history is founded partly on the absence of data, owing to the destruction of records, and partly on the interests of special theologues. A clearing up of our knowledge concerning the dark ages that preceded the rise of modern civilization, and a better appreciation of the still earlier ages, such as archaeology is bringing, must eventually shatter the claims of such special theologues. It is manifestly impossible that a church which aims to keep its claims respected can at the same time encourage knowledge and enlightenment, no matter what its professions. Hence its hostility to Abbé Loisy. H. T.

The Last Judgment

IT is, in the West, almost a foregone conclusion that one who speaks of the last judgment, or final judgment day, bases his ideas, if not his words, on the Christian Bible and its misinterpreters, even though he would be ashamed to confess the limitations of modern Christianity in his philosophy.

We should remember that all this Western thought-mold is quite unfitted for more than an extremely inaccurate, or more usually entirely erroneous interpretation of Eastern thought; and should in reality banish all shadow of Western modes of thought when reading an Eastern book if such thought is not to become a prejudicial limitation. Not that there is any reason to limit one's vision to modern Eastern molds, provided we can rise above both East and West and so gain a due perspective.

Unfortunately few of us even know that there is an Eastern mode of thought, much less a higher level above East and West. Our churches have claimed all the knowledge there is to know, but have maintained this claim only by keeping us as ignorant as we let them. Certainly they cannot help us. So all interpretations must be relative to our own limitations. Yet from the higher level, above both modes, it is possible to descend without loss to almost any expression of thought and fit it to the hearer, so far as he can comprehend, and only so far.

It is easy to say that there is a "last judgment day," for it is this very day. Nor is this any metaphysical subtlety. Regarding ourselves, all creation, as synthesizing units, we can begin anywhere along the line. If all mankind is a little too vast a perspective, or a universe too near our little ideas of infinity, let us begin at the atom or the insect. Has not even ordinary science shown us that the atom is an individual, a world, a cosmos, at the same time?

The life cycle of our atom is not easily understood by us, so let us go up the scale to more familiar ground—to the microbe or insect. These are made up of many atoms and are simply an aggregation of atomic worlds, universes, or individuals, as is every other organized body in nature. Observing these small lives, we say the life-cycle is very short, a few hours, a day or two, a few minutes. In each case time is as much an illusion as size, and those lives may, for all we know, contain more evolution than our threescore and ten years. So the cycle being run for, say a house fly, there is a final judgment day. The gross particles of the body disintegrate and go back to the workshop of nature to be economically utilized just according to their capacity. The less gross particles go back to the life ocean, we may suppose, and the still less gross atoms surely are not wasted but proceed to higher evolution exactly in so far as they are fitted for it.

Here are judgment days in plenty, final judgment days for every atom, physical and ethereal, of the fly. Some pass the line of their limitations and are received into a higher state; some fall below the mark and are recast. But we only assumed our fly-cosmos because we could not easily grasp the atom-cosmos. Must not the same process go on with the atom, the microbe, the small lives which in their turn go to make up the congeries of worlds or uni-

verses which we call a fly? Going higher yet, do we not find at any point along the line the same process in eternal motion?

An animal dies. The material particles break up or go to form small lives innumerable, even to our physical sight. Is any one of us so illogical as to think that the whole of that fine organism turns to maggots merely? Surely not. Our analogy would suggest to us that the higher portions of the animal-cosmos have gone where they are available in their present stage of evolution, and in intention, if not actually, why should not they go to form, even temporarily, aggregates of exactly similar entities forming the basis of some higher single consciousness, which in its turn is by their help raising itself to become one of a still higher aggregate, on its high plane a unity, on its low plane a world of lives such as these?

To obtain such distinctions between the capacity of any entity, atom or angel, for joining such an aggregate, there must be a line and a time where the higher separates from the lower and each goes to its own place, the lower the better for the association, the higher raised from its descent into the hell of such association to its "reward" — a higher consciousness, in its turn.

Now every such separation is a last judgment day, and is absolutely universal. Nothing is exempt, nor would we have it so, surely. Perhaps the atom on its plane runs its cycle in millionths of a second. Its component worlds and planets may have their cycles of time, to us infinitely small, to them a "lifetime," just as important to it as a lifetime to a man.

The aggregated entity has its judgment day, when the fly breaks up its associations of lives and worlds. The human being the same. Possibly, too, the god, no less, in terms of divine science.

But as these atoms are in a constant state of flux and reflux through these higher organisms, is there not a judgment for each of them as it joins and leaves the higher organism? And as the higher organism has its responsibility as to whether they shall gain by the impress of such association, or lose, is not every instant a judgment for or against the higher as well as the lower, while such mutual responsibility lasts? Aggregating these in their turn, are not our daily lives to be judged on even the thought plane by the instants of the day just past? And are not these days merely the components of that greater day we call a lifetime? And our lives the time-atoms of the collective life of humanity? And the collective life of our humanity merely an atom in the life of a universe-entity?

We have to see to it that when the time of the reaping of the divine qualities comes we be worthy to go forward and not as mere material particles to be cast out to feed the maggots and small lives of the planetary break-up, when its turn falls due. And to do this we cannot neglect any point of the aggregating atoms all along the lines, from the scientific atoms to the physical body, to the thought-creation we build around us, and to the world-atmosphere we aid in making. There is no cruelty or personal arbitrariness about such a chain of causes and effects in evolution. We should think a man a fool who tried to save some festering maggots out of a dead carcase and in their place leave earthbound the higher qualities of that organism, simply because the maggots be-

lieved on the man who did so, while the others belonged to a different sect.

So our final judgment day is now and all the time, in the atom and the universe, in the second and the eternity.

Even as Westerners can we find so graphic a symbol for the vast cycles and evolutions included in such an infinite immensity of thoughts as this includes, as a Judge and a Judgment day? It shows us our divinity and our responsibility — for we ourselves are the Judge, and the Judgment day is just when we choose to have it, since it is aggregated of every instant. Only — let none, priest or layman, so belie our divinity as to induce us to cling to the lower in preference to the higher — for the higher will leave without us if we refuse to cling to it, as it always does so obviously in the case of empires and races, national entities. The result of such a situation is the specter of anarchy, which Nature never tolerates very long seeing that it quickly becomes self-destructive.

P. A. M.

The Philosophy of "Nothing Matters"

THE attempt to deny man's innate divinity, to excuse him from effort, and to take away his responsibility, is the eternal Sin. Those who try to persuade us that we are inherently depraved and devoid of inherent goodness, or that our origin is purely animal, or that we are the helpless victims of forces, are guilty of this sin. The existence of this tendency in religion and in science has often been pointed out in these pages. And it lurks in other places too; in certain so-called "philosophies," for instance.

There is a nebulous sort of pseudo-philosophy, being talked about just now under various names. It puzzles some, amuses others; but nevertheless it must be regarded both as a symptom and as a subtle influence. Its general purport can easily be detected amid all the verbiage, sophistry, and confusion of thought. That purport is that it instills into our minds the notion that in some way or other it has been discovered and proved by learned and competent authorities that such things as duty, purpose in life, perfectibility, and the like, are in reality all delusions; that moral codes are purely arbitrary things constructed by various races at various times to suit temporary purposes, but that we are not bound by them. Nothing really matters, we are told; there is no such thing as the truth; we each make our own truth, to suit ourselves. And much more to similar effect.

And this pseudo-philosophy seeks to win respect for itself by claiming kinship with certain ancient and Oriental philosophies; but, like the ass in the lion's skin, its bray betrays it. Systems like the Tao philosophy of China are excellent *if fully understood and thoroughly carried out* — which requires the perfection of courage and devotion; but, when superficially dipped into and studied in an easy dilettante way, they lend themselves to a gospel of *laissez-faire* and self-indulgence. So with this pseudo-philosophy; it claims to preach the infinite and to scorn everything finite; but instead of casting off man's bonds and setting him free like a bird, it merely cuts his hawser and sets him adrift in the ocean of his fancies and caprices. It relieves us from our duties, but not from our desires; it inveighs against the aspirations but leaves the

propensities intact. It throws off the allegiance to obligations and leaves us free to indulge our selfish desires.

And the unthinking fool goes about and says, "I am a — ist. I do not know exactly what it means, but Professor So-and-So says it is all right." Professor So-and-So is the Pope who does the fool's thinking for him, the priest who looks after his soul for a consideration.

Whether the people who disseminate this kind of influence are conscious agents in the work of undermining the stability of the human judgment, or whether they are themselves bemuddled people who have lost their way and are letting themselves be used as tools by powers behind the scenes, while they themselves are satisfied with the incense that is burnt to them — is a question that need not be discussed. The point is that in either case the influence is destructive. But if people would only learn to trust their own judgment more, and refrain from worshiping "authorities" merely because they speak a language too deep for them to understand, these authorities would soon lose their customers. People ought to have more faith in their own character than to allow self-constituted teachers to explain it away for them.

We talk of the dangers of drugs and narcotics; but what are they compared with the dangers of all these mental poisons, that tell us that we do not really exist, that there is no such thing as matter or no such thing as spirit, and in one way or another reduce us to a helpless and undefended state amid the solid and undeniable realities of life? People who have any business to do in this life cannot afford to waste time in such fooling; their own existence is fact enough for them, and they have enough to do looking after their opportunities without waiting to be told that these do not exist. Let us go back to sanity.

H. T. EDGE, B. A. (*Cantab.*)

Outgrowing the Planet

WE are in a hard case *if* the following data are complete and correct.

The present population of the globe is reckoned at 1467 millions and the mean rate of increase at about 8 per cent per decade. The total available land will feed between three and four times as many people as now live from it. At the said rate of increase this maximum feedable number will be reached by about the year 2072.

So starvation is very near? Well, it may turn out that humanity is a fixed quantity, taking turns between Devachan and earth-lives, between rest and work; the working brigade occasionally getting a little more numerous for a century or so, and for another century or so a little less so. We have no data as to the world population a few centuries ago — very shaky ones for even a part of the world. As soon as people get the idea of a cosmic purpose, and of Reincarnation, they will as completely cease to be frightened about outrunning the means of subsistence, or the water getting under the crust, as they have ceased to fear the impact of a comet. Nature has made our home to fit us and she will do her part in keeping it up. This implies that there are intelligences and laws within what we vaguely call nature, capable of adjusting the conditions of human evolution. STUDENT

Art Music Literature and the Drama

Music and the Primal Cause

AS on a crisp, cold, clear night one looks above into the unconfined range of the azure dome of heaven, illuminated by myriads of flashing steel-points of light, each representing a sun or a world, some larger, others smaller, than those of our immediate system, one must be conscious of at least two things—the limitlessness of space, and the eternity of time. And he will gradually realize that he stands in the presence of a force so stupendous, so mighty, that try as he may to conjure from history comparisons in the way of the greatest achievements of men, they will fall as far short of the reality as does the mimic storm of the players' stage lag behind the terrors of a tornado.

The awful stillness of nature as its operations progress are impressive and tell of the might and power behind the visible as potently as does the reverberating thunder or vivid lightning that seems to rend the firmament and pour liquid flame from above into mountain top, hill-side, valley, and dale.

We may witness these manifestations of supreme might, but cannot perceive the cause. The effect is palpable, impressive; but we are as little informed of how it is all produced as is the child at the pantomime who witnesses the seeming wonders and transformations of the stage with open-eyed amazement. We know there is a great, immutable power operating the machinery of universal law, and that all we observe are the effects.

From atom to mountain, dew-drop to limitless sea, tiny plant to graceful palm, coral insect to monstrous denizen of the ocean, all are subject to the operation of that law; and whether it be the gentle zephyr of balmy spring, the biting blizzard of rugged winter, the gentle, warm rains and glad sunshine that come to fructify the crops, or raging cyclone that devastates homes and tears paths through forests, the same force, in differentiation of its potency and application, is in progress.

This same universal law is the basis of the musical art, than which few others so well exemplify affinity with the Great Source. It is the one art wherein all requirements of natural law are focussed; that is to say, the production of a perfect composition calls into action the same forces as those that rule the universe—the rhythmic forces of law and order.

Music is a manifestation through the emotions of the affinity of man with the Great Cause, and the melodious message of time winging its way to eternity. The principle, or law, that governs the vibratory elements in

music is similar to, nay identical with, that from whence springs light, heat, power, and life itself, and from protoplasm to highest known form of created being, still we find the same. Life is inconceivable in any form without vibration, and music an utter impossibility. And all true music, that which lifts man out of the personal into the impersonal, out of selfishness into the peace born of loving deeds, is of the Soul Universal. STUDENT

TORSTEN HEDLUND
Director of Göteborg (Sweden) Center of the
UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY

Man talar om ungdomens ideal. Jag högaktar dem, där de komma ur själen. Men det ideal, som ännu eldar mannens och värmer gubbens bröst, det som utgör livets prov, äger en skönhet, som är sanningens egen.—Geijer

You speak of the ideals of youth. They are worthy of our esteem when coming from the soul. But the ideal that still fires the heart of the man and still warms it in his old age—that which withstands the trials of life—has the beauty of Truth itself.

Art Teaching and the Awakened Life

LIFE itself is religion, science, and art; it would be better described by some term, if we had it, that included the three.

Separating art from life, and making it into a subsidiary function, takes from it its true character and dwarfs it. As Ruskin taught, one may be an artist without being a good man, but to be a great artist, a true artist, one must have a fine character. True art is the natural expression of a beautiful life; other kinds are merely imitations.

That this is so is continually being brought home to us. Witness the controversies over art education. It is admitted that forced education cannot produce anything but forced results, stilted formal productions that have not the freedom and spontaneity of art. So it is essential, we are told, to—teach spontaneity. (!) And so we come up against a contradiction in terms.

With regard to industry, it is pointed out that the essential for artistic production is that the craftsman should have an interest in his work; and how can he have this if he spends every day for years in a purely mechanical operation, punching a hole, sharpening a point, or some such detail, and then passing on the work to the next bench? He ought to make the whole thing himself from start to finish. Again, even if he did make the whole thing himself, how could he take a proper interest in it if he were merely working for a great producing company for wages?

The fact is that we cannot teach art properly, either in the schools or the factories, unless we begin at the beginning and make the life itself artistic; otherwise it is like a clumsy graft or a veneer. The love of work and creating must be the inspiring motive, not the desire to make a living or win fame. Which brings before us the *crux* of the situation. One cannot love one's work in the real way without high ideals as a basis. STUDENT

The Magic of Atmosphere

A VERY mystical suggestion is contained in the comment of an American painter upon the artist's perpetual search for scenery. No artist but will reiterate the words, although the Theosophist sees more deeply.

After all, so far as scenery is concerned, we find it here at home. Painting is not so much a matter of details as of circumstance, atmosphere, the play of light and shade. We do not go to Venice to see Canelettos, but to see the way the light reveals and plays about the buildings. It is not the Campanile or the spire at Rouen we are after, but the manner in which they seem to float in the air. That is what moves the painter. STUDENT

Theosophy is . . . a code of ethics so sublime that no Theosophist is capable of doing it justice.—H. P. Blavatsky

Râja Yoga Education and the Home

THE more earnest and affectionate parents are, the more they long that their children may have the very best training along all lines. There are many such parents who have lived lives of toil and privation in order to give their sons and daughters the advantages of education. These parents are, in a way, at the mercy of educators, and they are bound to accept what—at the end sometimes of a long term of years—their children have become through the influence and teaching of the various instructors to whose care they have been intrusted. But, as the world goes today, and as educational institutions go, what warrant have parents that the very best is done for their children? Have not many of the fondest parents and the wealthiest, seen their young sons and daughters return to them morbid wrecks of humanity?

There is not in the ordinary association in schools and colleges that which goes to up-build in the truest sense the physical, mental and moral nature of the pupils, and as the parents themselves are not wise enough to do this or to direct the doing of it, the weak do not grow strong, but fall by the way; and, in spite of the multiplication of magnificently appointed schools, there exists a vast number of weaklings who, if left to their own resources, would be nothing more nor less than "candidates for starvation."

The Râja Yoga School is the only one that returns the children to their parents with a better understanding even than their parents of what makes life strong and helpful. To all aspiring fathers and mothers this is a matter of intense interest. For aspiring parents know too well that they have not themselves received the training that would enable them to direct the unfolding of their children's characters as they might wish. Their own lives have not been based on the high endeavors that they so earnestly long to set before their children.

Life has developed in many ways very rapidly in the last fifty years, owing to the dawn of a new cycle. It is evident that there is an influx of high ideals of purity and sacredness and brotherhood. And the young people have these for their heritage. Their lives may be attuned to them. The position of parents at this time is one of peculiar responsibility and opportunity. They have before them not only

derful way, these children are being prepared to fight the battles of life, and lift all life to higher levels of thought and action.

Katherine Tingley has often said that if all the homes had the true basis, if all had been made with the full sense of the sacredness of marriage and its responsibilities, there would be no need of Râja Yoga Schools. These ideal foundations for the home we know are extremely rare, and those whose eyes have been opened to these things, and who desire better opportunities and deeper knowledge for their children avail themselves with gratitude of the training offered in Râja Yoga Schools. It is evident that children so trained to face their dual nature, to recognize the strength of their own divinity, and to exercise self-control, will bring to the home a most beneficent influence. They will inspire, lead forward, carry on in deeds, the highest aspirations of their parents.

A family life built up of the unselfish efforts of parents and children alike, will redeem the world. It will make of the home the spiritual center that it should be. It is for this that families should work. In this they will find their happiness and fullest development. Parents who have the interests of their children and of humanity at heart, will seek for the means to follow this course with their own loved ones. In Râja Yoga they see the opportunity of the hour. Day by day their children are revealing to them the higher possibilities of humanity. It is borne in upon them that among those who open their hearts to the teachings of Theosophy as it is applied to the needs of the children, and strive to live by them, there need be no wrecks along the way, but only harmonious growth, glorious fulfillment of the highest purpose of life. These students of life feel a glowing sense of gratitude to the Helpers of the race for providing this ideal environment in which parents and children may learn by Râja Yoga to build the ideal home life.

STUDENT

THE sea is a molten pearl,
And pearl the fleckless sky,
The firstling leaves unfurl,
And the air is a fragrant sigh.

A bird's soft madrigal
In the pear-tree's blossoming;
High on the church-spire tall
A white dove preens her wing.

The elemental strife
Lost in a peace profound,
In sound of quickening life
That yet is scarcely sound.

One with the starry chime
Earth keeps her rhythmic beat—
Our mother, old as time,
With heart still young and sweet.

Ina Coolbrith (California) in the May Century

the possibilities of a higher life for their own loved children, but for the children of the race. The most earnest of them are willing in assuming this double responsibility, to avail themselves of the true help that offers, even if some petty preferences and pleasures must be cast aside, in order that the immense advantage to childhood of a harmonious training of the physical, mental and moral nature may be gained. All the parents who have been watching the progress of their children in the Râja Yoga School feel assured that, in a very won-

The Increase of Insanity

IT is noted on all sides, and with considerable alarm in some quarters, that unless something is done to stem the tide of insanity in the United States, it will soon be a pressing problem as to how our insane are to be taken care of. Millions are spent every year in this way, but the numbers go on increasing. The asylums are filled to overflowing, and there are thousands upon thousands of these irresponsible people at large.

The public is beginning to inquire the cause of all this. To our knowledge, no germ has as yet been found upon which the blame can be shifted; and this is well, for it would be much better for us to face the matter ourselves.

It seems quite evident that the difficulty is in the mental atmosphere in which we live—into which all are pouring their thoughts, and from which all are receiving that for which they have the most affinity. As in a great sea, all are bathing in this atmosphere, whether they wish it or not. None are so strong as to be unaffected by it, and many are so weak that they are nothing but passive mediums, helpless preys to the thoughts which are floating about them. They are this today, that tomorrow, without stability or poise, irresponsible vehicles. What are we going to do about it, is an urgent question.

It would undoubtedly have a restraining effect to prevent marriages among those in whose families insanity exists; to stop the manufacture of alcoholic beverages; to make it impossible to obtain such drugs as opium, cocaine, and the like. The terrible condition would be held in abeyance; and yet, if the reform stopped with such external measures, it could not reach very far. The demon of Insanity, but held back for a time, would soon find other methods by which to claim its victims. For the terrible thought atmosphere, which, on some levels, is like hell let loose, would with fatal precision find the weak points in unguarded minds, and flood them with fiendish suggestions.

Theosophy offers the only real help in this appalling situation. For it teaches the nature of man: through a study of its philosophy it is possible to come to an understanding of the real forces at work, and how they may be guided. Self-knowledge; Self-mastery; these are the powers which are going to clear the atmosphere and open the doors of the kingdom of heaven. We are surely wasting time and losing sight of the real issues, if we focus our attention away from these and work only on external conditions.

Imagine what it would be if everyone could be made to feel the importance of purifying his own thoughts! Suppose that, overcome as so many are with despair, suffering, with unnamable horrors, they yet actually could be made to understand that these things would disappear if they would use all their effort to hold the best thought of which they are capable—if they could be made to cling to this, as a drowning man does to a straw! What a transformation there would be! How the clouds would begin to lift and visions of the Eternal Sun come to all! A united action of the human family might work the wonder in a moment. But as this is unattainable today, it is certainly worth while for each one who *will* think, to think to a purpose, and

ask himself what he can do to purify that part of the thought atmosphere for which he is responsible.

The insane are often obsessed by a feeling of jealousy; of suspicion; of vanity, thinking they are great persons; of revenge; or the other unworthy passions, from which few, very few, can be said to be wholly free. We certainly are our brothers' keepers; and who can assert that to the extent we indulge in any of these wrong feelings, we are not responsible for their presence on earth?

Is it not true that everyone who with positive and determined resolution refuses entrance into his mind of evil and selfish thoughts, and who with equal force sends out thoughts of love and helpfulness, radiates an atmosphere which purifies all who come near it? And if so, is such a one not doing a real work towards lessening insanity? Undoubtedly his work is much more more effective in

lately worked busy I. Ah, my tools, had you but revealed your uses a bit more clearly, what an inspiration this day's work might have been to all who work!

You thoughts, your weight was never guessed, I used you so carelessly, and so promiscuously—never knowing that each had its separate and distinct purpose, that some were useless for my work, and some actually damaging to it. The whole surface of my work is indented and defaced by careless use of you, my heavy thought-tools. If it were only morning now, how nicely I should discriminate, how careful I should be!

You words, if I had known your cutting edges, there had not been left so many rudely hacked and grotesque outlines. You, too, should have been used choicely, sparingly. Never were you given for the common purposes to which you have been devoted. To think of the charming, graceful, clean-cut

the world of realities, than one who joins a society for the consideration of the matter, but omits to guard his own thoughts.

So without waiting for further ceremony or questioning, all can begin at once to alleviate this condition; and by this method they will also alleviate every other evil which exists.

G. v. P.

The Tools

ALTHOUGH unfinished, my day's work must now be abandoned, for the sun has gone and twilight is falling. I have laid aside my working tools and wait now at the shop gates, which will open presently and set me free to return to my home and rest. My tools, the thoughts and words that gave my hands such giant's strength, lie scattered around me, the useless with the good. They are worn and old, these familiar helpers. They gave my day's work the form in which it stands tonight marking the place where

designs you were capable of producing, had I but known this morning what I know this night!

Old tools, I will gather you carefully together, label your names and uses, and stow you safely away. First comes rest tonight, but I shall return tomorrow with strength and skill renewed. Here I shall find you all again, my familiar tools, and then, out of this knowledge gained in this hour there shall arise a better day's work, my abused, my ancient instruments.

W. D.

It is this very law of Karma which gives strength to all that I have said. The individual cannot separate himself from the race nor the race from the individual. The law of Karma applies equally to all, though all are not equally developed. In helping on the development of others the Theosophist believes . . . that he is also, in the strictest sense, fulfilling his own.—H. P. Blavatsky, in *The Key to Theosophy*

Bells

IN medieval times bells were regarded with the greatest reverence. Every event that concerned the life of the city and its people was proclaimed by the ringing of bells. Their tones marked the passing hours; pealed matins and vespers; sounded deaths and births; tolled tidings of sorrow; shouted triumphant tidings of victory.

Many of these old bells have such inscriptions as this one: "Laudo Deum verum; plebem voco; defuncto ploro; pestem fugo; festa decoro"; I praise the true God; call the people; mourn the dead; dispel pestilence; grace festivals.

When a great bell was to be founded, often the nobles of the city and even the king would go to see the bell cast and would sometimes throw gold and silver bracelets and rings into the melting pot of glowing metal, for it was thought that such precious metals added sweetness and beauty to the tone. Then they would call on the name of some saint or hero as the liquid metal was poured into the clay mold.

The chief ingredients of bell-metal are copper and tin, sometimes zinc being added for shrill bells.

A perfect bell when struck near its rim gives four distinct notes, a tonic, with its third, fifth, and octave, forming a full common

TODAY

BE glad for today! Through sun or rain
Look out with resolve and hope,
For today will never come back again
In all life's lengthening scope—
Though years be many, of toil or play
You never again shall see today!

Make much of today. It is life's best gift
The real, the here and the now!
Our dreams and our longing idly drift
We know not where, nor how,
Nor if ever they may fulfilment meet
But, today is ours. Let today be sweet!

Selected

chord. Any fault in the mixing of the metal or in the shape or proportions of the bell will ruin its tone.

The Great Bell of Moscow is the largest in the world, being 21 feet in diameter and weighing 100,000 lbs. It has been cracked so long that no one knows what kind of tone it had. The next in size is the deep, solemn-toned bell of Saint Ivan's in Moscow. Some other famous big ones are the bells of Pekin, Novgorod, Notre Dame, Cologne, York, and St. Peters. The best loved bell in America is the Liberty Bell of Philadelphia that pealed forth the birth of a new nation in 1776.

The Dutch were the first to use bells for

playing melodies. Peals of bells arranged for this are called *Carillons*. Carillons are now rung by machinery and mark the hours and even the quarters by sending their tuneful melodies from the bell-tower over the rooftops all through the day and night.

Those evening bells; those evening bells;
How many a tale their music tells
Of youth and home and that sweet time
When first we heard their soothing chime.

So sang the Irish poet Moore, and poets of every land have loved the bells and sung of them.

L.

A Curious Bird

EARLY travelers in the forest region of Brazil were startled at the sound of a bell pealing from the depths of the woods, where, for ages, no man had been. Many a legend was woven round this strange voice of the forest; but later on it was discovered to be the note of the bell-bird, the *chasmorhynchus niveus*.

THE CHILDREN'S HOUR

Will You Be a Worker?

TIM had been kept a good deal to himself. His mother was a widow and she and her little son were the greatest of friends. Lately they had come to live in a house that adjoined one in which another little boy about Tim's age lived with his father and mother. Tim was a great deal out in his garden, cherishing his violets and early primroses in the sheltered corner for "Mother dear." She loved flowers so. At odd times he watched his little neighbor through the fence and he often heard crying and loud bawling, after "I want this" or "I want that" had echoed across to him in his happy play-work of gardening, and Tim felt as if a shadow had crossed the sun; it seemed to make a sad lonely feeling come about. He told his mother, and she said, "Alas! selfishness always made the gloom that dimmed the brightness, for sunshine came from the heart and the heart was never selfish." And Tim learned to look upon selfishness as the "Shadow-man."

"What are you looking at?" Bobby asked one morning, coming close to the fence in turn.

"Your beautiful toys," Tim answered.

The proud owner gave them a careless glance. "I've a train too," he said, "I'll show you."

"Tim," called his mother. "Tomorrow," he said to Bobby, and was gone.

Next day his mother took him with her when she went to return her neighbor's call. And while the ladies chatted inside, the children made friends on the verandah.

"Why did you run away yesterday?" asked Bobby.

"Mother called," Tim answered.

"Couldn't she wait till you saw the train?" asked Bobby. "I don't go at once when I am called."

"I love my mother," answered Tim simply.

"So do I," said Bobby, with wide opened eyes.

"Funny way to show it," said Tim.

"Will you allow your little boy to come and play with my boy sometimes?" asked Bobby's mother; and so it came about that they had a game together once a day.

"It is your first work, Tim," said his mother as she kissed him goodbye the first day he went in to see Bobby. "You go as a messenger of order, obedience and love. May you be true to your trust."

Tim felt as the heroes feel marching to plant the standard of freedom in the land of an enslaved people. He soon found that "I want" was a ruler in Bobby's life, and a dreadful life the tyrant led the boy, and moreover the tyrant attacked him too, for sometimes when

THE FIRST BLOSSOM RAJA YOGA CHILDREN AT THE LOTUS POND

THE COUNTRY CHILD

THE Country Child has fragrances
He breathes about him as he goes;
Clear eyes that look at distances,
And in his cheeks the wilding rose.

The sun, the sun himself will stain
The country face to his own red,
The red-gold of the ripening grain,
And bleach to white the curly head.

He rises to the morning lark,
Sleeps with the evening primroses,
Before the curtain of the dark
Lets down its splendor, starred with bees.

He sleeps so sweet without a dream
Under brown cottage eaves and deep,
His window holds one stray moonbeam,
As though an angel kept his sleep.

He feeds on honest country fare,
Drinks the clear water of the spring,
Green carpets wait him everywhere,
Where he may run, where he may sing.

He hath his country lore by heart,
And what is friend and what is foe;
Hath conned Dame Nature's book apart,
Her child since he began to grow.

When he is old, when he goes sad,
Hobbling upon a twisted knee,
He keeps somewhat of joys he had
Since an old countryman is he.

He keeps his childhood's innocencies,
Though his old head be bleached to snow,
Forget-me-nots still hold his eyes,
And in his cheeks old roses blow.

Katherine Tynan in *The Spectator*

Bobby wanted something, he wanted it too and felt quite cross at the idea of giving it up. This set Tim thinking.

"Mother," he asked one day, after telling her of his difficulty, "how do you stop being selfish?"

"Making up your mind to think about other people's happiness, instead of your own," she

answered, "and the younger you begin, the easier it will be; and never forget, Tim, example is catching." There was a twinkle in the mother's eyes and Tim laughed too.

"It is a big tug, sometimes," he said.

"It is," his mother answered, "but who is the man that conquers?"

"The one that doesn't give in," said Tim, after a minute.

"Just so," she replied. "And don't you think it is the strongest that will hold on the longest?"

"Of course," said the boy.

"Your Warrior-Self has ages of knowledge and experience behind him," his mother continued softly. "Won't you link your forces with his?"

Tim's eyes were shining. Drawing himself erect, heels

together, toes out, he saluted.

"I will!" said he earnestly.

And his mother turned to her work with a smile, for the future looked hopeful for Bobby and Tim. E. I. W.

The Still, Small Voice

ON a warm summer's night, Alice and her mother sat under a large beech tree in the garden, watching the stars peep out. Suddenly Alice said:

"Mother, I know what the still, small voice is."

"What is it dear?" asked her mother, smiling.

"Why, whenever I am puzzled about anything, and wonder and wonder about it, then when I have quite forgotten it, and am deeply interested in something else—maybe while I am reading, all of a sudden, a thought, *that I do not think myself*, will flash into my mind, and it will be just the answer to what I had been thinking about. That is the still, small voice of the silence, because I only hear it when my mind isn't thinking anything; don't you think so, Mother?"

"Yes, dear child, it is; and that is why it is so important to cultivate silence; the true silence of the mind, not alone of the lips, so that we can hear the messages that the still, small voice is ever trying to give us, but cannot always be heard because of the mental clamor of our conflicting thoughts."

"Oh! now I understand why 'the mind is the slayer of the real'!" exclaimed Alice, "because the still, small voice is the voice of our real selves, isn't it? and the mind drowns the real so it cannot be heard. But it seems almost impossible to keep the mind still," she added.

"Nothing is impossible when the spiritual will is awakened," answered her mother; and for a long time they sat, silently watching the stars. COUSIN AUDREY

THE MYSTERIES OF THE HEART DOCTRINE

PREPARED BY
KATHERINE TINGLEY
AND HER PUPILS

The Theosophical Book *of the* Twentieth Century

Tells the story and the history of the Theosophical Movement.

The prices are \$2 in cloth and \$1 in paper, which barely cover the cost, for it is printed and bound, not gaudily, but with such carefulness and thoroughness of art and craft as to make it unique among modern edition books.

ORDER FROM THE
THEOSOPHICAL PUBLISHING CO., POINT LOMA, CAL.

Isis Conservatory of Music OF THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY POINT LOMA, CALIFORNIA

Personal applications and inquiries received every Saturday
by the Secretary at SAN DIEGO BRANCH

SOME OF THE ERRORS OF CHRISTIAN SCIENCE CRITICISM

BY H. P. BLAVATSKY AND WILLIAM Q. JUDGE

CONTENTS

"The Empty Vessel Makes the Greatest Sound"
A Note of Warning

—by H. P. Blavatsky

Of "Metaphysical Healing"
Affirmations and Denials

The Cure of Diseases

Replanting Diseases for Future Use

—by William Q. Judge

A MOST VALUABLE PAMPHLET. Outside of Theosophy there is given no adequate explanation of the healing that is at times accomplished, nor of its rationale, nor of the ultimate price that must be paid and the dangers connected with such practices.

This pamphlet is invaluable to all students.

Vicarious Meditation

WE laugh a little now-a-days at the prayers of past generations: prayers for rain, prayers against earthquake and pestilence, prayers for the prosperity of our town. Neither is there so much prayer as once for individual notice, for the departure of an illness, for help against bankruptcy, for a new hat. Philosophy has stepped in, speaking of an impersonal Infinite. Emerson has been thought into a system. "The All," the "Infinite," the "Abstract Good," are terms floating lightly in the air ready for the immediate appropriation and use of the last system of "New Thought."

You don't *pray* to The All or The Infinite; the fashionable thing is to "get in tune" with it. Having done that, being "at one with the Infinite," you don't *ask* for what you want — the new hat, or more income; you "will it in the silence" and the trick is done. There is an even simpler way to which we will refer in a moment.

Taking a recent and typical "New Thought" book, we find it in its second chapter announcing its "real purpose," which is "to suggest how to go into the silence and permit the Universal to act in order that unfoldment which will fill the heart's desire may follow." The "unfoldment," observe, consists in the growth of the power to "permit" the Universal to pander to one's "heart's desire." How is the trick to be learned? Thus:

First acquire the power to sit upright and motionless for a whole hour:

Then, after a week or several weeks' practice, as the case may be . . . the real work will begin. I would then have him (the student) go to his sitting, taking the rigid position for about fifteen or twenty minutes, centralizing his thought upon what he desires. . . . If it is an accomplishment which he has not, let him image himself as having already attained it and *standing before people throwing out evidence of the fact* . . . for by these means he is adding to Hindu meditation the method presented by Jesus of praying as if already the blessing had been received. [!]

As the "gifts" are gathered one by one into possession, "the student may penetrate, following the path deeper and deeper, till he enters the holy of holies in the halls of silence." That by the time he gets there, he may be a medium with neither will nor power to hold his mind still an instant, is not mentioned; nor that he may have become a terrified specter-seer who cannot tell his hallucinations from flesh and blood.

Not Thy will — if Thou hast one — O

Infinite, be done, but Mine! I want a new hat, more money, power to fascinate others, eloquence, a magnetic personality. Thou hast all these things in the cold storage of Thy holy of holies; produce them for thy worshiper!

The final step of degradation is to *pay* someone to enter the holy of holies for you, to save you all these hours of trouble sitting bolt upright in a chair telling the Infinite what you want. There are now weekly magazines the mere subscribing to which enrolls you in a "fellowship" to whose whole circle the editor sends out "success vibrations" worked into the very wrapper. An extra monthly dollar brings a personal letter in which these vibrations are minutely worked out to suit your particular case — need of hat, cash, magnetic personality, etc.

The old mystics and Theosophists taught that the Infinite was to be reached by *surrender* of desire, by a boundless well-wishing for all humanity, by absolute self-government, by absolute performance of duty in the smallest and greatest particulars, by a concentration of thought in aspiration of which we can hardly form any representation.

And now the Infinite is a candy-store ready at any moment to hand out anything; and you can have your aspiration and meditation done for you for a dollar. We seem to be near the bottom of the hill, heirs of the ages as we think ourselves. But the legacy of the diviner ages is not hypnotism, not psychic quackery, not mediumship; and it will never be touched by those who would sell or use its smallest truth for cash or for adulation.

H. CORYN, M. R. C. S.

Methodists Teach that Man is his Own Savior

IN the *American Review of Reviews* there is an article on the work of Bishop Hartzell, the Methodist Episcopal Church's missionary Bishop for Africa. The Bishop seems to be a man cast in a large mold, of the kind that possibly do more credit to their church than their church does to them; but the appreciation of his work is made the occasion for a panegyric on Christianity and the church, in which they are represented as being all that they ought to be but are not. The claims made about the church, and many of the statements made about Africa, will strike well-informed readers as constituting a misrepresentation tending to mislead the very ignorant and to surprise others. For instance:

Africa could not be other than a dark continent, dominated by her false religions. They have given

no light to the intellect and no warmth to the heart. It is Christianity that is giving to that continent light and life. . . . Africa could never be anything but dark with the Sphinx as a God—Sphinx is a Greek word for an Egyptian idol, which means a squeezer or strangler. This deity has squeezed the spirit life out of the continent. Like other forms of African paganism, the Egyptian religion acknowledged man's inability to save himself, and the necessity of his securing help from without. So it laid hold of power, as the thing necessary. At Gizeh it carved out of solid stone a huge figure of a human head on the body of a lion, the expression of the greatest animal force, as the symbol of the union of humanity and power.

Thus Africa, an enormous continent, more than three times the size of the United States, is spoken of as if it were quite a small place. Its innumerable tribal superstitions, among innumerable totally different races of savages and semi-savages, from the North Temperate Zone to the South Temperate Zone, and from longitude 50° E. to 18° W., are jumbled together and confused with the sublime Wisdom-Religion of the greatest civilization (the ancient Egyptian) known to history! This sort of thing can only go down among the very ignorant; what is to be thought of our boasted education, which is said to teach geography, history, and ethnography, if statements like this can be aired with a prospect of being acceptable?

And to sum up the whole Egyptian religion under the single illustration of the sphinx, making no allusion whatever to the countless other vast and indestructible monuments that have survived throughout the ages to testify to the greatness of that civilization, and the inscriptions which have been deciphered showing the sublimity of its teachings and practice! What is our civilization compared thereto? What will remain of our churches after the millenniums have rolled by? And the ignorance about the sphinx! Was not the sphinx an emblematic conception common to many ancient nations, including the Assyrians and Greeks? And what has the etymology to do with the question? It is Greek and not Egyptian, and refers to the destruction incurred by those who fail to solve the riddle of the sphinx—that is death, which awaits all, even the Methodists, who have not solved this mystery of immortality. By playing upon derivations one could make anybody, the Christians included, look foolish.

But the most surprising thing is that about the Egyptian religion teaching man's inability to save himself, and needing help from without. This is the very charge which Theosophy has always brought against the Christian churches. For denying this teaching, the churches have always most bitterly assailed Theosophy. Anyone the least acquainted with the issues between Theosophy and the churches knows that this point—of man's ability or inability to be his own savior—is the chief issue. The churches teach that man cannot save himself, that it is impious and presumptuous to think so, and that man requires the aid of a Savior to act as intercessory between him and God. This is the characteristic church doctrine, all that makes the churches what they are, proclaimed persistently and passionately from every pulpit, to deny which is the worst heresy. Theosophy, however, denies it, and declares that man is his own savior by virtue of his own innate Divinity, and needs no intercession. Theo-

sophy fights unremittingly to destroy the deadly doctrine of vicarious salvation by which churches and ecclesiasticism maintain their power, and true Christianity is strangled.

Yet here we have a Christian church executing a complete somersault, appropriating for its very own the doctrine which it has denounced Theosophists for holding, and for not holding which Theosophists have condemned it! If the Methodist Episcopal Church does really after all hold the doctrine that man is his own savior, needing no external aid, Theosophy has done it a grave injustice; to repair which the best way will be for the church at once to proclaim its new doctrine so that in the future there may be no doubt, either among Theosophists or its own members, as to what it does teach.

There are also a few other teachings set down in this marvelous article as being those of the Christian churches; and again Theosophy must confess to having hitherto been badly misled by somebody or other as to the teachings of the churches. Nevertheless, so long as the false teachings continue to be current and to pass muster in the public mind for those of the churches, Theosophy will be bound to criticise them, and it must be left to the churches to exculpate themselves by showing that they do not hold these false views, but that they hold the views which this article says they do.

A little boy was brought to Africa to escape the fury of a murderous king. He came to express the union of humanity with Deity, and He was the Truth. . . . The Divine human Child, though the Mystery of Mysteries, was Infinite Love, which is the key that unlocks the mysteries of life and of death. He came to be a brother to every other man on the earth, and to bring them to the heart of his Father.

What can this be but the Theosophical teaching of the Divinity of man? But is it part of the ordinary stock-in-trade of the Methodist pulpit? Or are there two sets of doctrines, one for rhetorical purposes and the other for practical use; one for African savages and one for home consumption? The only fault a Theosophist could find with the above is that it neglects to mention the other little boys who have from time to time been born for the purpose of reminding humanity of the eternal truth of its own Divinity. Jesus was indeed a "Son of God," who came to remind other people that *they too* were Sons of God; but there have been many other such Messengers.

As aforesaid, Theosophists find that under the name of church teaching, there exists a mass of doctrine that is the very reverse of that set forth above, and which Theosophists regard as erroneous and hurtful to the people. Therefore they have to combat it, and in doing so, often find themselves in direct and bitter conflict with the churches and their representatives. For the churches to go on teaching these erroneous and harmful doctrines, while at the same time trumpeting forth their alleged acceptance of very different doctrines—doctrines which Theosophy holds, is assailed for holding, and blames the churches for not holding—is a method of defense which is bound to recoil upon those who resort to it. The churches cannot continue with impunity to proclaim the truth while teaching error; and that this is so is daily shown by the sore upheavals that are taking place

among the rank and file of their adherents.

Many missionaries, *in spite of their religion*, are excellent men and do good civilizing work. But this is on account of their superior character. They are better than the average among the adherents of the religion; perhaps this is why they do not stay at home. Missionary enterprise is entitled to credit for what good it does; and no one denies that it does some good. But how very much more good it might do if the churches which support it lived up to their declared principles, instead of merely utilizing its good deeds as an unearned feather in their own caps! And, in spite of all that can be said, the missionary does open the way for what follows him—for influences which remove the savage from this sinful earth and send him by a short cut to heaven. Trees must be judged by their fruits; and Christian civilization is not yet so perfect as to render it an undisputed question whether it is desirable to spread it about in place of other people's institutions.

Altogether this panegyric is strangely out-of-date, and sounds like an echo from a vanishing past of smug self-satisfaction; with the difference that it has been found necessary to profess the most advanced and liberal views where formerly the stern narrow tenets of the old orthodoxy would have been unblushingly acknowledged. H. T. EDGE, B. A. (*Cantab.*)

How Many Senses Have We?

SOME blind persons can move about in places unfamiliar to them with certainty and the avoidance of collisions; and bats can steer clear of obstacles in total darkness. An experimenter, who blinded some bats, discovered that they still do this as well as before. Those blind people who possess this sense describe it vaguely as being located in and near the forehead and as being like a light touch. People who are not blind will surely recognize this description as applying to their own experience in moving about a dark room; one seems to be able to feel the nearness of a solid obstacle. It is suggested that the mechanism of this sense is a function of the first branch of the trigeminal nerves, whose fibers ramify through the face. The hairs on the faces of animals are probably connected with this power.

It should be borne in mind that the senses are modifications of one great sense—perception, and that a too rigorous classification or labeling of them narrows our ideas. Also the range of the senses is much enlarged if we include among them that host of what have been called physiological sensations, by which we are made aware of various bodily conditions of comfort, discomfort, etc. Going a stage farther, we come to what might be called mental senses, by which we perceive the presence of thought-forms in the mind and pictures in the imagination; or emotional senses, by which we feel certain emotions.

All consciousness is thus resolvable into the duality of Knower and Known, Perceiver and Perceived; even our thoughts being thus dual, and involving a perceiving faculty and a thought-substance (as it were) that is perceived. Matter, in its wider sense, is the effect produced by the interaction of the perceiver and the thing perceived, and it may be physical or otherwise; physical matter is the result of perception on the physical plane. STUDENT

Some Views on XXth Century Problems

Mind and Brain

IT was once thought so axiomatic that the best thinkers must have the largest, the most convoluted, or in some other way the most obviously exceptional brains that the facts *had* to correspond, whether they wanted to or not. They mostly did not want to, so the few cases in which they *were* willing had to do double and triple duty. Cuvier and Carlyle were kind enough to have brains of sixty-three ounces or more and so we were always reading about them. Men of equal eminence with less brain, had to keep quiet about it.

The whole subject has been very carefully re-investigated by Dr. Mall of the Johns Hopkins University. He has gone over the reported facts and deductions of the older observers as well as studying a large amount of new material. He says:

A survey of the literature on the peculiarities of the brain in men of genius, in women and in the lower races indicates that some anatomists have thought that they could determine, almost at a glance, whether or not a given specimen came from a great man, a woman, or from a negro.

This, in a very elaborate paper in *The American Journal of Anatomy*, he controverts. Many of the older results, on the basis of the very figures themselves, he attributes to the "personal equation," that is, preconception, of the anatomists. He says:

I would like to ask them to separate a collection of 100 brains (50 of men and 50 of women) each of the same weight and see how well they can do it. Until their "guesses" prove to be correct in over 50 per cent of the specimens examined we must conclude that the "differences" . . . are largely due to the personal equation of the investigator.

He illustrates this by the tables of Meynert, who concluded "that in men as contrasted with women there is relatively more brain substance in front of the central sulcus than behind it"—that is more frontal lobe; and remarks that this conclusion is not justified by *Meynert's own figures*. Calling the whole brain mantle by weight 1000, the frontal lobe or portion of it in the female at various ages weighs 425, 416, 410, and 415, as against figures for the male at the same ages, of 416, 414, 412, and 414, these figures being Meynert's!

Says Dr. Mall:

While these various attempts, which we consider unsuccessful, have been made to show that there is an unlike distribution of the brain substance in women and in men, attempts have been made to show that in the brains of negroes as well as in those of men of genius similar distinctions can be found. This would be a discovery of great importance. . . . It appears, however, that no such unequal distribution of brain substance exists.

The difference is of absolute weight, not of distribution, the brain of woman being lighter and of the negro lighter still.

Another anatomist, Spitzka, a few years ago made "the startling announcement" that the corpus callosum—the band connecting the right and left halves of the brain—was larger in eminent than in ordinary men. Large capacity for thinking, he decided, required that this band should be large. A large number of brains, white and negro, were

tested accordingly, the weight of the corpus callosum being estimated against that of the whole brain. Spitzka was wrong:

In fact many negroes of lighter brain weight have larger callosa than most of Spitzka's eminent men.

Summing up this part of the case, Dr. Mall says:

I must therefore conclude that with the methods at our disposal it is impossible to detect a relative difference in the weight or size of the frontal lobe due to either race or sex and that probably none exists.

He then takes up another point:

As it is generally believed that the brains of men of genius are of complex configuration, so it is also believed that the brains of lowly races are of a simple and embryonic type.

In support of this contention he quotes Parker, adding:

To anyone who is familiar with the negro brain the statements of Parker appear to be careless and superficial. His observations . . . cannot be taken seriously in the light of recent studies . . . and they strike one rather as an opinion supported by a strong personal prejudice. . . . The above tables [Dr. Mall's own] are given to show . . . that with the present crude methods the statement that the negro brain approaches the foetal or the simian brain more than does the white is entirely unwarranted.

As to the brain of the man of genius, Dr. Mall remarks:

Since Wagner's time quite a large number of brains of distinguished persons has been studied and in general the conclusion has gradually been reached that with the methods at our disposal we are unable to detect in their anatomy conditions to account for great mental ability. The recent studies of Ritzius all point in this direction, for he was unable to detect anything remarkable in the brains of distinguished individuals, and no one is more competent than this investigator to deal with this subject. . . . It certainly would be important if it could be shown that the complexity of the gyri and sulci of the brain varied with the intelligence of the individual . . . but the facts do not bear this out.

In respect of sex, Dr. Mall reaches the conclusion that the configuration of the female brain is not simpler than that of the male, though the variations from the average type are less. He does not think that a collection of brains whose weight was not considered could be assigned with any accuracy to the respective sexes.

It is by no means established that there are male and female types of the brain due to the form and arrangement of the gyri and sulci, as has been so frequently asserted. Each claim for specific differences fails when tested.

Finally summing up, Dr. Mall says:

In this study of several anatomical characters said to vary according to race and sex, the evidence advanced has been tested and found wanting. . . . For the present the crudeness of our method will not permit us to determine anatomical characters due to race, sex, or genius. . . . The study has been still further complicated by the personal equation of the investigator. Arguments for difference due to race, sex, and genius will henceforward need to be based upon new data, really scientifically treated and not on the older statements.

The brain weighers have never decided what is a man of genius. All sorts of diverse people are lumped under that title. There are calculating geniuses, who can do nothing else. There are memory storehouses, like that

Swede who died knowing forty languages. There are abstract thinkers like Mill, seers like Emerson, feelers of the unutterable like Whitman, picture-builders like Dante, artists, musicians, inventors—a hundred varieties. How can real genius be so defined as to cover that one common element in all—who really have it?

Brain is the servant of genius in respect of being the instrument for the accumulation and storage of the formal material upon which genius has to work. Genius is a special quality and intensity of reaction to, or action upon, what brain contains, itself belonging wholly to the subjective plane of the *user* of material, not of the material itself. It is a soul quality. Brain may be of vast size or have vast contents, e.g., forty languages, with which the owner does nothing; it may have few contents, but those few used by a genius in the production of the highest works of genius. This brain weighing and measuring is the search for the worker among the tools of *one* of his workrooms. STUDENT

Cypher-Grubbing

A CONTEMPORARY, moved to some scorn by the cypher-grubbing which is now the fashionable substitute for the *reading* of Shakespeare, suggests that the grubbers should come up a plane. Let them hunt parallelisms of *thought* in the plays and essays; by such, if numerous and real, we might actually be convinced.

If the pertinacity of the Baconians were directed to finding their traces of Bacon in the intellectual part of the plays themselves instead of in the rude typography of printers of the sixteenth and early seventeenth centuries, they would be doing greater honor to their hero and a greater service to the world. They would be cultivating the higher tastes and perceptions instead of descending to detective work . . . continually bent on the petty business of exposing typographical tricks instead of looking to the ideas and the poetry embodying them, basely neglecting the sense for the letter, neglecting the spiritual content for the external and mechanical detail.

Without accepting their theory, he flings them something to begin upon. Here is Bacon's definition of philanthropy:

I take goodness in this sense—the affecting of the weal of men—which is that the Grecians call philanthropia; and the word humanity (as it is used) is a little too light to express it. This, of all virtues and dignities of the mind, is the greatest, being the character of the Deity; and, without it, man is a busy, mischievous, wretched thing, no better than a kind of vermin.

The parallel from Shakespeare is of course Portia's eulogium of mercy:

'Tis mightiest in the mightiest; it becomes The throned monarch better than his crown; His scepter shows the force of temporal power, But mercy is above this scepter'd sway, It is enthroned in the hearts of kings; It is an attribute to God himself; And earthly power doth then show likest God's When mercy seasons justice. Therefore, Jew, Though justice be thy plea, consider this, That in the course of justice none of us Should see salvation.

Not very close, but a better beginning than all the cyphers that will ever be pieced from the ancient pi. STUDENT

The Seven-Headed Cobra

THE Seven-headed Serpent is a very frequent symbol of the Wisdom-Religion, to be found in a variety of cosmogonies. Even in the *Revelations* there is a seven-headed dragon. The snake signifies cycles of time, and the seven heads seven races. But the serpent symbol is prolific of meanings, as is also the number seven; and whole libraries of wisdom are summed up in such symbols.

The Mound-Builders

THE great mound at Moundsville, W. Va., on the Grave Creek Flats, near the Ohio River, is to be bought by the State of West Virginia. After unceasing activity for 20 years the legislature has appropriated \$10,000, which, with a gift of \$5000 from the heirs of the late proprietor and a similar gift from the school children of the State, is sufficient to secure it. The proprietor bought it 25 years ago to prevent it being sold to a man who wanted to turn it into a pleasure resort with a saloon on the top; his heirs lately decided to sell, and the State secured an option.

The mound is the largest in America (says a paper) and was discovered in 1770 by the first settler in that region. Standing in a valley of 4000 acres, it affords a view of the surrounding country for miles. It is 70 feet high and 900 in circumference, with trees on it 700 years old. When discovered, it was 90 feet high; and if any estimate of its original height can be made from the denudation, the fact that the trees then on it were as dense and large as the surrounding forest, one oak being at least 600 years old, must be taken into account.

Says the *Cincinnati Inquirer*:

Even conjecture cannot point to the time when the mammoth mound was erected by a bygone people. It may have been old when the Pyramids were being built by half a million men or when Cleopatra's Needle was being fashioned. Certain it is that the mound was erected by a prehistoric race who were very similar to the Egyptians, ruled by some one monarch who had sufficient control to combine vast numbers of them in a huge undertaking.

In 1838 the mound was opened by a passage-way toward the center, and at 100 feet from the entrance two skeletons were found in a vault of unhewn timbers and loose stones. One of the skeletons was surrounded by 650 ivory beads and an ivory ornament 6 inches in length. A shaft was sunk from the summit, and 34 feet above the first vault another was found, containing a skeleton which had been ornamented with copper rings, plates of mica, and bone beads. But the most interesting find was a stone engraved with unknown characters resembling those used by Scandinavian priests before the introduction of the Roman

Lomaland Photo. and Engraving Dept.

SCULPTURE OF THE FAMOUS SEVEN-HEADED COBRA ANURADHAPURA, CEYLON

The work is of singularly fine design and masterly execution

alphabet replaced the old Runic characters.

In the account from which these particulars are drawn the mound is spoken of as a memorial of the aboriginal life of a prehistoric people, and the people is compared with the ancient Egyptians in a way that suggests that they also are considered aboriginal. We take the word "aboriginal" to mean a people who did not immigrate into the country, as other races have immigrated, but were there "from the beginning"; and this inevitably suggests, whether it is intended to do so or not, that this aboriginal people developed in accordance with the theories of anthropology. Hence the fact that the supposed aborigines were not barbaric, but mighty builders and highly organized, sets back the period of such evolution indefinitely. Besides, the theory, if adhered to consistently, would require that we should make the cave-dwellers and kitchen-midden folk much older than the mound-builders; nay, even the modern Red-Men must be regarded as in some inconceivable way living in the past, for they have not a mighty monarch able to build huge pyramids. (!) In short, the theory that the civilization of a race is connected with its antiquity will not hold water; for in the past, as in the present, races of varying degrees of culture have tenanted the earth side by side.

It has frequently been stated in the *CENTURY PATH* that countries in both the Old World and the New were, in a very remote past,

colonized by immigrants from the continent of Atlantis which sank beneath the ocean; and that these immigrants carried their culture and science with them. But these offshoots of a mighty race that had run its course gradually degenerated, leaving to their successors as age succeeded age, less and less of power and culture. It is thus that looking back through the pages of history as revealed in the records of the soil, we find increasing instead of decreasing culture, until we come to the modern tribesman whose knowledge is preserved more in recollection than in achievement.

Huge structures of the nature of mounds, pyramids, or dolmens are found in most parts of the world, and it puzzles modern science to conjecture their object. While some have doubtless been used at different times for fortifications and others for temples, and most of them have been made the chosen repository for people's bones, it is impossible to think that any one of these purposes was the original design of such a widespread practice of building. Rather do they point to the existence, among those Atlantean colonists, of a science to which we have not as yet found the clue; and students of the Secret Doctrine will find many hints as to the nature of that science with the evidences for its existence. We must not

forget, in this connexion, the vast stone buildings of Central and South America with their curious inscriptions, which again reminds one of the Egyptians; as the present mound, with its rune-like inscriptions, points to ancient Scandinavia.

Once let us succeed in ridding ourselves of the deep hypnotic impression produced on our minds by the Darwinian hypothesis and the theories it has led to, and we may be able to study the facts in the light of an unbiased judgment; thus learning much about the mighty past of which we are the heirs, and the mighty peoples whose Souls are even now finding birth among us.

Yildiz Kiosk Library

IT is stated that the fall of Abdul Hamid and consequent opening of Yildiz Kiosk will render accessible to students one of the finest Oriental libraries in the world. Hundreds of old Greek, Arabian, and Persian manuscripts were collected in the 14th, 15th, and 16th centuries in the Greek monasteries and these were transferred to the libraries of the old seraglio. Abdul Hamid, who was a book collector, had them removed to his palace, where the public could never see them; but his successor has more liberal ideas. So perhaps now we shall discover some missing links in history. No institution, however bad in some ways, is without advantages in other ways, and the Law turns evil to good. T.

✻ The Trend of Twentieth Century Science ✻

Breathing the Sun Stuff

WHAT becomes of the auroras? The question is not so unreasonable, for auroras are not an appearance only but an appearance of something. Science has now a couple of theories as to what that something is. Both of them make it come from the sun—partly a deduction from the fact that auroras correspond in intensity with the two chief solar cycles, the eleven-year spot cycle and the twenty-six-day rotation cycle. Both of them make the essence of it corpuscular, and their difference is as to the nature of the corpuscles. Professor Birkeland, a Norwegian, thinks the corpuscles to be electrons—the so-far ultimate constituents of the atom and one of the ingredients of the x -rays. They are hurled from the volcanic sun-spots, travel at perhaps half the velocity of light, and finally reach the earth. Professor Arrhenius, a Swede, regards them as considerably larger, forced from the sun to the earth by the beat upon them of the solar light, the outward pressure of this being greater than the backward draw of gravitation.

In either case, charged with negative electricity, they reach our atmosphere, mostly near the equator. The earth is a magnet and its two poles pull them in streams north and south spirally, the spiral running round eastward. As the streams converge from the equator to the poles they necessarily become denser, all the time charging the atmosphere with electricity. Finally, near the poles, it is charged enough to glow. The glow is sometimes soft and uniformly diffused; sometimes in curtailed streamers. If a stage curtain were clasped together tightly at the top, but at the bottom allowed to hang freely over the stage in its folds; if there were a wind playing so as to blow the folds about; and if every fiber were glowing with electric light, greenish, violet, and faint yellow—we should get some idea of the aurora.

One wonders whether this continuous rain of matter, massively slight as it may be, but continuing age after age, is deposited at and near the poles; or is drawn into the earth's interior somewhere with the entering magnetic lines; or is blown with the lower winds towards the equator. In the latter case we may at every breath be taking into our lungs matter which a few days ago was part of the sun. That may seem startling for a moment, but the pulse of light which every tree and plant is using at this moment to build with, left the sun but eight minutes ago. STUDENT

The Earth Tides

THE earth tides of Professors Hecker and Flammarion appear to have taken their place as proved facts, but M. Moreux has another view of their cause. The only cause assigned by the first observers is that which produces ocean tides, the attractions of the moon and sun. When the moon, sun, and earth are in line, and at their nearest, the crustal and oceanic tides will be highest, the average for the former amounting to eight inches. At this period earthquakes will be most frequent—in fact are so.

The French astronomer appeals to electricity also. A charged body swells; a Leyden jar whose coats have their full charge is larger than before. For M. Moreux, that which corresponds in the earth to the outer coat of the jar is the atmosphere; the crust is the jar itself; the core is the inner coat. When the atmosphere has its full charge the crust expands, getting away from the core. When the charge diminishes the crust lies down again upon the core. When either of these changes begins the tendency to earthquakes is greatest. But the charge is greatest about midday; least in the early morning. Earthquakes are therefore most frequent at night, when the charge of the day is nearly spent; and in the early morning when the new charge is beginning.

But the theory, however correct as supplying another cause of crustal tides, seems to work loose at an important joint in respect of earthquakes. It makes the sun "at one time hold the earth's crust above the gaseous or liquid interior and at another time allow it to rest upon this interior." But the interior is supposed to be a liquid or gas at such an enormous pressure as to be solid. Any expansion of the crust due to a charge of the atmosphere—an expansion of not more than about eight inches—would be far too minute to "hold it above" the compressed interior. The intensity of the apposition would not be practically altered. It can only be by accentuation of the soli-lunar tides that M. Moreux' cause contributes to earthquakes. STUDENT

Metals as Food

A CONSIDERABLE amount of experimentation has been done to determine the rôle of the various metals contained as salts in protoplasm. It cannot be said, however, that we know much even of those that exist in considerable amounts, potassium, calcium, magnesium, sodium, or even iron; still less of those whose existence almost or actually requires the spectroscope to detect it.

But that these latter have a rôle the plants are beginning to teach us. What that is the future must reveal. We have found that some plants, e.g., strawberries, grow best in soil containing a minute amount of copper, which they take up. The slight skin trouble which in some people strawberries cause and in others benefit, may possibly find here its explanation.

Manganese, in medicine of real but secondary value, also exists in some plants, perhaps in all, but in very minute amount. But recent experiments with it as a "complementary fertilizer" have shown that it plays a very important rôle.

Now it turns out that plants have something to do with zinc. M. Javillier, a French chemist, has detected it in about fifty families, in some of which it is almost an essential. But so small is its amount that an addition of one ten millionth part to the soil or culture medium is all that is necessary to triple or quadruple the growth, the effect of even one fifty millionth being perceptible. The former, the

homoeopaths would call the seventh decimal dilution; say a grain in say a thousand pints of water or three hundred pounds of soil.

Some of these metals, copper, zinc, silver, perhaps arsenic, and others, might perhaps develop new powers in the service of medicine if they were given in natural combination with plant tissue.

It is now known that fruits and seeds are batteries ready to work. They are regarded as accumulators, or perhaps Leyden jars, getting their charge from the earth and air. Possibly, however, they generate their own charge, in some way using the minute proportions of various metals which they contain.

STUDENT

The Menace of Concrete

IT would seem that before our concrete buildings will be safe we must re-discover a lost art. At the recent annual meeting of the (English) Iron and Steel Institute, Mr. Cushman (Assistant Director of the Office of Public Roads in the U. S. Department of Agriculture) said:

Probably we could not today, with all our boasted knowledge, build an iron monument like that at Delhi, which, with no protective coating, had stood since the dim beginning of history without rust or decay.

We might remark, however, that the monument, though of course very ancient, does not date back to "the dim beginning of history."

In the absence of this art we are assuming that a coat of concrete is sufficient to protect the contained iron from change. At the same meeting, the President of the Institute, Sir Hugh Bell,

commented on the fact that half the buildings in the United States and many in England were being erected of cement with iron for their mainstay, under conditions of profound ignorance as to what was going to happen in the future. Was it not probable that before very long disasters of a very serious character might occur with reference to buildings of that kind?

Not even glass is absolutely impervious to air; far less so concrete. The bases of the foundations are often on permanently wet rock, the water being charged with various saline matters, acid and alkaline. The earth and air are of different electric signs, and electrolyzing currents, however small, must be constantly playing through the concreted iron, tending to disintegrate that part of it which is in the rocky moisture. Even the Delhi monument might have crumbled into rust if it had been cased in concrete, built 300 feet high, and put to stand on a deep damp foundation. Concrete must absorb a little moisture from damp air also.

But apart from oxidation or electrolytic disintegration, are we sufficiently cognizant of the effects of continuous electric currents on steel? May not the inner configuration upon which its toughness depends, gradually give place to a fine crystallization—that is, the toughness give place to brittleness? Is not such a result, in point of fact, ultimately sure? It may take a century, but by that time the central buildings of all our great cities may be 600 feet high—and then . . . ? C.

A LOMALAND HEDGE OF CHEROKEE ROSES

Submerged Continents

“**V**AST areas now covered by the ocean, which were once dry land,” says a newspaper at the head of an article in which it has compiled a list of cases in point, *apropos* of the recent discovery that a group of little islands south of New Zealand were once part of the great continent of Lemuria. Science admits that the continental distribution of land and water has varied often during geological history; but it does not yet realize how intimately these phenomena are concerned with human history. To science, human history is a brief episode occurring at the very end of the geological chronology; but to Theosophy, the history of the earth and the history of man are coeval. Surely this latter view is the more reasonable and harmonious; and, so far as evidence goes, Theosophy again can rest assured that the verdict of time will be on its side. As science grows older, it comes round more and more to the view that the Theosophical teaching is the correct one and that humanity is much older than had been supposed.

The continent of Atlantis, stretching for the most part between the Old World and the New, has been admitted as a fact by many geologists. This was the home of the Fourth Root-Race of humanity, the one preceding our

present Root-Race, which is the Fifth and has been on earth about 1,000,000 years. Plato gives some account of a certain island which was one of the last peaks of Atlantis to disappear. The fact that some of the inhabitants of Atlantis took refuge in the New World and some in the Old accounts for the existence in both those hemispheres of ancient civilizations of great renown and bearing marked similarities in their culture.

The great continent of the southern seas, to which the name Lemuria has been given by some scientists, is also admitted; it was the home of the Third Root-Race, and colonies therefrom passed to Ceylon and other parts of Asia, giving rise to mighty civilizations whose remains lie buried and will some day be traced. The remote descendants of these races—what may be called physical remnants of them—exist as the “aborigines” of various continents and islands.

It has been debated whether the changes of land-surface have been gradual or cataclysmic, but neither of these processes will suffice alone. There is much evidence in support of both, and the undoubted truth is that both processes have played their part in producing the result, just as we observe them both at work on the smaller scale of denudation, where the erosion is achieved partly by continuous

action and partly by sudden floods. While slow changes are always going on on the earth's surface, there are occasional periods, recurring cyclically, when changes of greater magnitude and rapidity occur. Of both kinds of change the rocks give us testimony, so that both cataclysmists and the advocates of continuous change are right as far as they go.

Human history corresponds with these processes; for it also is subject to changes that are slow and continuous and changes that are periodic and abrupt. Whiles we move placidly along a gentle curve, and whiles we take a sharp turn; and this both in human affairs and in cosmic phenomena, for both are intimately related.

The study of Science as a mighty whole, consistent in all its parts, is a grand study. It is that of Theosophy. Its central subject is the study of Man himself—that is of our own nature. Hence the practical study of the art and science of Right Living forms the kernel of a Theosophist's life.

How strange is the modern scientific view of a vast universe, unfathomable in its antiquity, power and resources,—yet all a great weird purposeless machine! Is not the ancient view that all is alive, intelligent—the vesture of Deity and of deities—one appealing alike to reason and sentiment? STUDENT

UP from the beach there's floating a strain
Of music all so vague and fleeting,
No one could croon it o'er again;
Maybe it's the heart of the wise world beating.

Hush, not a word nor a breath! The earth
Is full of glamorous things tonight;
A million miracles stirring for birth
From the hills a-glimmer with bluebell light.

We are *not* mere mournful human things
That all the moil of the mind should move us;
There's a Weaver of old Enchantment flings
His flame-dark wings through the dusk above us.

And a fire hath leaped to the ends of the earth,
Bringing to birth in its diamond glow
All that the gay Gods hold of mirth,
All that the wisest wise Gods know.

There's a Weaver of old Enchantment wakes
From the dim grey realms of our early dreaming;
And a light that's brighter than daylight breaks
Over heart-deep, long-hid fairylands gleaming.

What if we laugh now? Never of old
Was life more worthy of young gods' laughter;
Though even the suns were balls of gold
That we played with once, and rioted after.

Magic is ever the dust of spray,
And the leagues pearl-grey, where the waves are
riding;

We shall turn again to the paths of day
With the Heart of the World in our own hearts
hiding.

From the Welsh

The Desire of Escape

HUMAN beings pass the years in carelessness, perhaps for many lives; sow seeds of pain and disaster; or create a terrible inharmony within their own natures; and then a time comes in their evolution when they begin, first vaguely, then clearly, to realize the situation to which they have brought themselves. It is felt as a bitter rebellion against circumstances, or as an utter disgust for, or profound weariness of, all their surroundings, including themselves. And the desire of escape takes possession of them as a mania. Anything seems better than the present existence, and if they cannot drown sensation in novel reading, in gaiety, in business excitement, in dissipation, then some other method is tried.

This is no doubt the explanation in a general way of the numerous disappearances the papers report. Such things have perhaps always happened, but not with the appalling frequency of today. Consciousness and realization are growing keener. Nature has called a halt in the mad chase of selfishness. The age is transitional, and the unrest has reached fever-heat.

It is not only those who have been disappointed in love or ambition, who have disgraced themselves, who thus forsake the battle and run away. But very very many who have

apparently just what one would most desire: a home, money and friends, leave them all — and for what? The verdict, if no accident can be imagined, is that they are insane. The verdict no doubt is true. Such have yielded to the insane desire to escape from themselves until finally the desire possessed them, and they could no longer control it.

In lesser degree, this is a desire which assails everyone, everyday. Not, of course, the desire to disappear, but the unwillingness fairly and squarely to face oneself, to recognize one's hidden motives to action, and to refuse to permit any lower one to rule. It is so much easier to throw a glamor over this, to slip along, and find reasons for doing what one wants. Those who have silenced their consciences through long years of practice, and are governed only by policy, reach to their selfish goal with more ease. There is no war within themselves, and they can proceed without self-excuse. They feel secure in their position and have no desire to run away. Nature must leave them to their temporary enjoyments, to bring them up later in a way terrible to them.

But those who have not reached this state of depravity, all the way up to those who are struggling with intense earnestness to overcome and silence their lower impulses, feel the battle, and have not only once but often known the desire to escape, and yielded to it. The terrible thing is to deny this fact to oneself, for through this method the vision becomes clouded and the way is finally lost. One often sees those who have always a pious reason for doing just what they want to do. It is a pitiful sight. And who has not seen those who do something outwardly good to cover up something else which was not good but cruelly selfish?

The real virtue which nature demands is to approach each and every smallest duty in the right way, and do it, whether pleasant or otherwise, in a spirit of joy because it is right; to seize each moment as it passes and in it score a victory over self; to face the truth unflinchingly, and never seek to obscure it; to act according to the highest light at the time; and never to rest in the struggle against unworthy, selfish, despondent, and weakening thoughts. This is the sort of morality which Theosophy teaches.

What shall we say of those who today are fighting against this mighty movement — this movement which demands and gives of the very best and noblest, which is not satisfied with an external morality, but which goes to the very heart of purity? Do such condemn it, or themselves?

STUDENT

Isaiah's Watchman and the Cyclic Law

Watchman, what of the night? Watchman, what of the night? The watchman said: "The morning cometh and the night also. (Isaiah xxi. 11, 12)

ACCORDING to Theosophy, all the conditions and events of life revolve in cycles. They have their birth, their growth, their full maturity, and then their slow decline and death. After a lapse of time they reappear and the successive changes run their course again. Our brighter moods must of necessity give place to intervals of gloom as evening shadows deepen into night after the sun has set. Not until we recognize and make allowance for these oscillations in our

consciousness can we attain to mental equilibrium, nor can our minds enjoy more dignity and calm than children have who fluctuate between the two alternatives of tears and laughter throughout the waking day.

If a devoted mother were to hear her child at night crying alone in terror of the dark, she very properly would comfort her by telling her the morning was at hand and night would soon be over. Shall we say, however, that were she guided strictly by a logical consistency she ought to call her child indoors when playing in the morning sunshine and advise her not to be too happy as the cyclic law would soon bring round the dreaded shades of night once more? Such an extreme of philosophy in mothers is happily very rare; but those of us who have attained full growth may well consider the inevitable backward swing of life's inexorable pendulum, and steadily confront the situation here described.

No change from darker moods to lighter ones can bring us permanent relief; for in due course the change itself will be transformed into something else and cannot furnish an abiding satisfaction for the soul. The Universe in all its parts is in perpetual flow, and while we willingly subject ourselves to Nature's sway by our preoccupation with the body and the lower mind, we must be subject to the ebbing and the flowing of the tides. Are men forever doomed to float like corks upon the restless waves of moods and feelings? Have we no better destiny than everlasting oscillation?

"Nature" by derivation signifies that which is born and hence must die. From the Divine she issues forth, back to her source she must return; therefore in all her many-chambered mansions can we never find a lasting habitation for the soul. But man in inmost essence is an undivided part of the unseen reality which causes, but is not affected by, the ebbing and the flowing of the tides.

The human race in general and the individual for himself are destined to achieve their independence from the tyranny of cyclic law. Man may arise and claim his long-forgotten dignity of being one with the Divine and work indeed in harmony with cyclic law, but holding all the while to that supreme, eternal life which burns with never wavering glory in the inner shrine.

The vast majority of humankind are the servants of the cycles as they come and go, and alternate incessantly between the antics of the dancing faun and the prostration of tearful Niobe. And all the while the Sphinx in balanced equilibrium, the human head the ruler, and the body of the brute as slave, sits gazing on Eternity with changeless satisfaction smiling on his face, inviting us to seize our heritage and share his peace. STUDENT

FIRE, light, day, the fortnight of the waxing moon, six months of the sun's northern course — going then and knowing the Supreme Spirit, men go to the Supreme. But those who depart in smoke, at night, during the fortnight of the waning moon, and while the sun is in the path of his southern journey, proceed for a while to the regions of the moon and again return to mortal birth. These two, *light* and *darkness*, are the world's eternal ways; by one a man goes not to return, by the other he cometh back upon earth.—*Gîtâ*

WHEN THE SUN RISETH SPLENDID
(PAN GYFYD YR HEULWEN)

WHEN the sun riseth splendid
O'er mountains and bay,
When Night and her sadness
He hurrieth away;
When the lark, singing, soareth
Where no eye can see,
For all this bright beauty
Our tribute to Thee!

When the sunset's turned pearl
And the sky-roses die,
When Night and her glory
O'er-traileth the sky,
When the flame of the west
Hath grown dim o'er the sea,
For all this dark beauty
Our tribute to Thee!

THEOSOPHICAL FORUM

Conducted by J. H. Fussell

✽

Question What has Theosophy to offer of greater value than is offered by the various societies for Ethical Culture?

Answer A philosophy of life. A thought-system which co-relates all parts of man's being, and makes it possible for him to be good vigorously, and to some purpose. It is easy enough to draw up a list of the virtues, and prefix each one of them with a *Thou shalt be*; man, weighed down with that Old Man of the Sea, his lower self, is very apt to answer *I shall not*.

We have become sodden with the idea of one life, and are preyed upon by all the evils that follow. What is within the sphere of this present personality interests us; the rest can go by the board. "You say virtue is good," says the lower self; "but I shall get more money by not considering it too closely; I shall get the pleasure I want now by steering clear of it altogether. Here am I; some seventy years of life in this body, or less than that, is all I can be sure of. I must get the greatest good I can in the time, the best time I can; which is best to be accomplished by a wise compromise. Too much un-virtue is of course a mistake; one might be found out, and there is health to be thought of. One must keep up appearances before the world; lack of respectability is inconvenient. But a little so-and-so, and a little so-and-so, and a little so-and-so—what would you have?—it can do no harm. One does not notice much falling off of efficiency. As for this making a fight of it that you propose; this exertion to attain virtues of which the value is by no means evident; why, it would be to spoil the enjoyment of life. Posterity? The benefit of mankind at large? I do not perceive my connexion with either. I set my contemporaries the good example of attending to the conventions; and as for those who are to come, there is evolution or providence or something of the kind to attend to them. Let us have moderation in all things; especially in virtue."

Now what are you to say to this? No doubt the scheme will not work; but with what argument shall the brain-mind overturn it? We never allow facts to prove anything to us; we must see the connexion between them and their causes, admitting no possi-

bility of the truth of more comfortable views. What if the world is beset with foes; terrible vice that creeps in everywhere, sapping physique, sanity, manhood? No doubt the city is full of slums, and the slums of horrors unspeakable; *What has that*, says Average Mediocrity, the apostle of compromise, *to do with me? I have my business to attend to; and am, as the world goes, a good, respectable man. I see no reason why revelations of the evils of modern life should spur me to discontent with my own unheroic, undebased living.* Oh Angel of the Church of Laodicea, thou wert the most distasteful of all thy companions!

Effort is needed above all things, or else it would seem our humanity is doomed. Perhaps bad men are better off than the merely lethargic; for they are inviting the stripes of the Law, by which they may learn; they are at least in motion; better than the limpets. Effort is the one thing our smug "moderation" (save the mark!), our ignoble, politic compromise between heaven and hell, totally excuses us from making; even forbids us to make. This world of ours is crying out for heroes, for an awakening of men, for a cleaner, bolder, manlier life. It is fearfully threatened and invaded; our casualties are always drifting into the asylums, as children into the prisons, into suicide; and we do not understand the danger of making private treaties with the invader. Will the commendation of this and that virtue aid us? Has the preaching of ethics, without philosophy, power magically to work a change? What has such preaching to offer? Vagueness only; many a good stone, but no plan for the building; an instrument perhaps, but no tuner for its strings.

But Theosophy has this to offer; the stern fact of human brotherhood; responsibility dire and utter, the last word that can be said in that. Evil is one, and whoso makes treaty with it, is traitor to mankind. Strike it down in your own life; fight on towards the virtues; or you are feeding that force which fills the jails and asylums, and weaves a winding-sheet for your nation. To work in societies for reform is good; but such work is like fighting in the dark; it is like the duel "with brickbats at three quarters of a mile": the foe is face to face to you, however disguised, in your own nature and daily living; unless you fight it there unflinchingly and always, you do nothing to lessen its general power.

And again, Theosophy offers Reincarnation; we cannot escape this world of our own making. There is no comfortable *Après moi le déluge* for us here; no such thing as an *after me*. Whenever a deluge may come, we shall be there to suffer it; let us turn to, and see that it shall never come.

Every day we make some trifling compromise between the right and the desired, doing about half of the best we could. So much mire upon the wings; so many fibers of a web weaving itself around our strength and possibilities. *Well, you say, and what if we do go down a little dimmed in luster to the grave? It is the fashion.* But what, if the thing is not to end there nor be remedied there? If no obstacle can ever be evaded; if nature insists upon perfection? We may shirk the facing of self now; but the thing will haunt

us until done. *Thus far shalt thou go, and no farther*; with this we are to be confronted eternally, until the shirked duty has been perfectly performed. Is it some virtue that we will not trouble to acquire? Nature insists upon perfection, and *will* have it from you at the last. With agelong, undimmed patience she works, slowly molding the stuff of our being; rather, forcing upon ourselves the molding of it. For the trouble we shrink from now will confront us again, so much the harder for our failure to master it; and again and again until our duty is done by it; then we pass on. The little fault we did not find worth correcting now is to do some growth, if unchecked, in the course of a few lives; and every stage of its growth is to meet with due fruitage of punishment; it shall it last become unbearable, so that all our being must be staked on getting free. One can put up with the thought of remaining lazy or absent-minded for one life-time; but when the conviction comes that the failing is to last absolutely until we stir ourselves and conquer it, becoming more and more intolerable all the time; why then that effort is apt to be made, which the world so insistently calls for.

STUDENT

THEOSOPHIST. And we Theosophists say that your vaunted progress and civilization are no better than a host of will-o'-the-wisps flickering over a marsh which exhales a poisonous and deadly miasma. This because we see selfishness, crime, immorality, and all the evils imaginable, pouncing upon unfortunate mankind from this Pandora's box which you call an age of progress, and increasing *pari passu* with the growth of your material civilization. . . .

INQUIRER. Then is all this metaphysics and mysticism with which you occupy yourself so much, of no importance?

THEO. To the masses, who need only practical guidance and support, they are not of much consequence; but for the educated, the natural leaders of the masses, those whose modes of thought and action will sooner or later be adopted by those masses, they are of the greatest importance. It is only by means of the philosophy that an intelligent and educated man can avoid the intellectual suicide of believing on blind faith; and it is only by assimilating the strict continuity and logical coherence of the Eastern, if not esoteric, doctrines that he can realize their truth. Conviction breeds enthusiasm and "enthusiasm," says Bulwer Lytton, "is the genius of sincerity, and truth accomplishes no victories without it"; while Emerson most truly remarks that "every great and commanding movement in the annals of the world is the triumph of enthusiasm." And what is more calculated to produce such a feeling than a philosophy so grand, so consistent, so logical, and so all-embracing as our Eastern doctrines?

INQ. And yet its enemies are very numerous, and every day Theosophy acquires new opponents.

THEO. And this is precisely what proves its intrinsic excellence and value. . . . The chief point is to uproot that most fertile source of all crime and immorality—the belief that it is possible for men to escape the consequences of their own actions.—H. P. Blavatsky, in *The Key to Theosophy*

THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY

FOUNDED AT NEW YORK CITY IN 1875 BY H. P. BLAVATSKY, WILLIAM Q. JUDGE AND OTHERS
REORGANIZED IN 1898 BY KATHERINE TINGLEY

C e n t r a l O f f i c e P o i n t L o m a C a l i f o r n i a

The Headquarters of the Society at Point Loma with the buildings and grounds, are no "Community" "Settlement" or "Colony." They form no experiment in Socialism, Communism, or anything of similar nature, but are the Central Executive Office of an international organization where the business of the same is carried on, and where the teachings of Theosophy are being demonstrated. Midway 'twixt East and West, where the rising Sun of Progress and Enlightenment shall one day stand at full meridian, the Headquarters of the Society unite the philosophic Orient with the practical West

The World of Religion

A Halo for Thomas Paine

THAT clergymen of various denominations are meeting on the same platform with representatives of many schools of ethics, freethought, and philosophy, to commemorate the centennial of Thomas Paine's death, illustrates the healing effects of time. Time allows the age to progress to the point at which the great pioneer stood when he so rudely shook it; time removes the disturber to a distance whence his closer rays can no more scorch us and we see only the mild halo that surrounds his head. The ancients placed their departed great among the stars; and though we do not actually do this, we can seem to see Paine, Jeanne, and Jesus slipping back into the starry distance as we progress along the path of time, until from fiery orbs they have become faint opalescent glows which we may worship without blistering our hands or blinding our eyes.

Yet if these great ones were here now, would they not still be pioneers, as much in advance of our present state as they were in advance of the stage they found us in? Should we not have to postpone our incense until death and time had again banished them to the harmless distance whence the stars and saints look down on us?

But it is a little captious to blame people for not sanctifying their heroes while they are here. A pioneer must be out of tune with his times, or he would not be a pioneer. We can hardly call the people inconsistent for doing now what they would not do a century or a millennium ago. Yet there were a few who recognized the hero while he was here; and these few are always the advance-guard.

Perhaps the most important point about this Paine centennial is the admission of the fact that he was slandered. For what a tale this tells! It tells us that the detractors were unable to find in his life materials to support the charges they brought against him, and that consequently they had to manufacture materials. In how many other cases, one asks, does this happen? Have not conscientious historians, delving patiently among actual records, discovered time and again that much of the defamatory history upon which we have been brought up is lies? An attack on atheism is utterly beside the mark in the case of Paine, since he was simply not an atheist; and this is now freely admitted, with evidence of his

MEMBERSHIP

in the Universal Brotherhood and Theosophical Society may be either "at large" or in a local Branch. Adhesion to the principle of Universal Brotherhood is the only prerequisite to membership. The Organization represents no particular creed; it is entirely unsectarian, and includes professors of all faiths, only exacting from each member that large toleration of the beliefs of others which he desires them to exhibit towards his own.

Applications for membership in a Branch should be addressed to the local Director; for membership "at large" to G. de Purucker, Membership Secretary, International Theosophical Headquarters, Point Loma, California.

own statements of a belief in his God. His life is admitted to have been noble and clean and self-sacrificing.

The Anglican Church

It is announced that a hospital for the practice of healing by prayer and the laying on of hands has been opened in London with the permission of the Anglican Church authorities. This is indeed an ugly duckling for the church; it has claimed the protection of the mother hen on the ground of strict authenticity, but is likely to hatch out into something rather unmanageable. Of course to heal by prayer and the laying on of hands is strictly "scriptural," so what appeal can be made against it? But it may also be sheer charlatany or mischievous dabbling in psychism. The ecclesiastical authorities are likely to have some difficult cases to adjudicate on.

The prime requisite in such an experiment is your holy man—as necessary as water in an irrigation plant. You cannot irrigate plants with a pump and hose and no water; nor can you irrigate them with kerosene or acid. There are some people whom I should not care to let put their hands on my head, and whose prayers I would rather do without, even though they might wear a white tie and be reasonably sanctimonious. I have a superstition that God is not so easily on tap as these healers seem to think, and a fear that they might inadvertently tap some other source and let loose the wrong kind of unction upon my head. They would probably put a good deal of their own personal "magnetism" into me, and I should want to inquire into their heredity and habits. I fancy that even a good man, praying devoutly, might, through his want of knowledge and experience in such matters, accidentally make a mistake. My spiritual surgeon might sever the wrong spiritual nerve, or let his spiritual scissors slip and cut some higher artery in me. Or, while he was abstracted in prayer, some little blemish might jump off his back on to mine and stay there.

Should not the Anglican Church license its

healers, after subjecting them to an examination? It could make revenues out of the licenses and the fines for practising without a license. Supporters of the institution will point to cures as a proof of its efficacy and desirability. But do not the quacks and vendors of nostrums do likewise? What do ye more than they? Healing may quite

possibly be one of the functions of a properly constituted church; but our present churches have too many other things that need attending to first. And until these are set right, healing is a matter which they would do far better to let alone.

Pastor Ousted for Broad Views

A UNIVERSITY professor has been called upon to withdraw from the ministry of his church in consequence of the views expressed in a book he has written on the function of religion. According to the charges brought by the executive body which tried him, he teaches that

God did not make man in his own image, but man made God in his own image.

We are not fallen angels, but developed animals.

Miracles have always been the refuge of ignorance, and modern technic must take the place of magic.

Science has undermined the trinity. (A graphic metaphor!)

Jesus was a child of his time, and to copy him is to kill the soul.

The book of humanity is greater than the Bible.

The last is scarcely consistent with number two; if man is a developed animal, the power that develops him must be greater than man himself. Theosophy teaches that man's lower nature has animal affinities and connexions, and that the power which develops it is the real man. Consequently, for Theosophy, the book of humanity may rightly be described as greater than the Bible. But again, a distinction ought to be made between the dead-letter interpretation of the various English translations of the Bible and the Bible as understood in its allegorical sense.

It is of course true that the theological conceptions of God were conceived in the brain of man. If we wish to rise beyond a mere mental conception of a God, we can but look within our own nature and see what facts we can find. We shall find there the voice of conscience exhorting to higher aims than the satisfaction of personal desires and caprices;

(CONCLUDED ON PAGE 12)

THE THEOSOPHICAL ADDRESS AT ISIS THEATER

A VERY attentive audience listened to Professor H. T. Edge's address on the Science of Theosophy at the Isis Theater last Sunday. The speaker pointed out clearly that in the great work of promoting the Cause of universal brotherhood the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY attached high importance to the study and dissemination of the philosophic and scientific aspects of Theosophy as brought to the world by H. P. Blavatsky toward the latter end of the nineteenth century. Though Theosophy includes all nature in its view and is able to throw a bright illumination upon the more obscure happenings which occasionally attract attention, this does not mean that the lecturers sent out from Point Loma by Katherine Tingley, and the writers of Theosophical literature, whose aim is to help those who are hungering for the bread of wisdom, should provide entertainment calculated to tickle the ears of curiosity-hunters who are merely desirous to hear something about psychic phenomena. Professor Edge said:

"It is evident that the Theosophical work does not proceed on that plan. Otherwise nothing would be easier than to write and deliver such lectures and charge money for them; and doubtless Mrs. Tingley and her students could make a very good business out of it. But this would not be Theosophy. Mrs. Tingley is the successor of Madame Blavatsky, bound to carry out the Founder's objects, and, indeed, being identified wholeheartedly therewith; and her students are, many of them, pledged disciples of Madame Blavatsky, or the other Leaders, William Q. Judge, and Katherine Tingley, and all are identified with the same purposes. These purposes are sufficiently well understood to be the regeneration of human society and the spreading of true wisdom and self-knowledge.

"... True Occultism begins with the study of mind. Its material is human nature itself; its laboratory is humanity. The first step is self-study, self-culture. And the first requisite is health and the balance of the faculties. . . . The force that binds upon the plane of materiality and shuts us out from true knowledge and freedom is the force of our own passions. The attempt to force one's way into the inner regions without having gained the strength to master this dragon results in a quickening of the passions and in our falling a victim to their intensified power. That this is no idle threat, but a serious reality rests not only upon the evidence of students who have been intimately connected with Theosophy for more than twenty years, but on the testimony of facts that are daily coming to notice.

"The science of Self-knowledge and Self-control is the great fundamental science that interests the members of the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY.

"Knowledge is free to all; it must be shared. The purpose of Theosophy is to aid men in setting themselves free from the trammels of their selfishness and passion. To attempt to teach occult matters without preliminary self-purification would be only fastening those chains tighter upon them. And this Theosophy will never do." OBSERVER

The Gods and the Law

"Oh happy singers of that vernal day!
Fled is the simple, bounded world ye saw;
Those gods, that never dashed the world with awe,
Sunny Imaginations, fled are they;
And on Olympus, blind and ruthless Law
Holds unadorned his adamantine sway."

FALSE, false; it is a hideous thing that our bards should be singing so; there is not a word of truth in it that is not warped, distorted and awry. What a desolation is over the world, when those who know how beauty is to be fashioned, choose to fashion their beauty out of such gray material. This is not of the stuff that poems are made of, however close its manner to the manner of poetry. It is the poet's place to reveal the sunbright regions beyond our own, and proclaim the dazzling reality of things. He must make the desert yield glimpses of the fountain, and remind us, while we are on the plains, of the mountains of the gods.

"Great Pan is dead," was the cry of old; and Pan heard it from his secret places, and wept or smiled compassionate. All systems that ever were in the world, and all human blindness and foolery, will not stop the flow of life perpetual through the veins of existence. Pan never died; it was an enchantment that was set upon our eyes, that we should no more behold him. Limpets on the rock of selfhood, draw down your shells close, and never become aware of the sea! We are washed by it every tide, with its multitudinous life and life and life; could it come down through those firm, impenetrable shells. The great currents of life go by, and we pay no heed. Perhaps Pallas herself drew nigh to you on the hillside, to arm you, like Perseus, with wonders; but you could not attend to her, by reason of the great dinner that you had to digest; perhaps when Apollo was nearest to you planning to reveal Parnassus and the whole poetry and richness of the world, you were too busy with your money schemes to pay him the least heed. There are diamonds in the world; for all that we can find none on our dust heap; there are figs and grapes, but they do not grow on the thistles.

Law is not blind and ruthless; and it was not Law that drove away the Immortal Kindred; it was itself ousted from our vision with them. We put away Law out of our lives, and were from that moment doomed to lose remembrance of the gods. There is nothing haphazard or go-as-you-please about these; the universe is *not* Topsiturveydom irresponsible, but is all a-ripple with joy and exultation. All the green and purple places still ring with the golden laughter of the gods, and the winds still echo it; the sea still sparkles with it, and of it the sun's glory is still compounded. There is not a growing thing without its dreams, not a flower unliving or bereft of joy. Every mountain is Olympus, throne of the Workers of Destiny; do not for a moment believe that the Morning Star is fallen from heaven.

The fact that the ancients knew all this, and yet fell away from it utterly in their lives, proves to what splendid heights men attained in forgotten days, and explains our own fall upon such a heritage of gloom. We had to shut our eyes to law, when no justification could be found for our lives without a whole machinery of scapegoats, atonement,

irresponsibility, and what not. At one time we had an eye to learning great lessons and doing great service; latterly, we became absorbed selfishly in getting out of the mess our lives had brought us into. The Law, as we knew of old, is possessed of millions of eyes and hands, and a heart universal and all compassion: not one moment of our lives need go unguarded or unguided. The great Stream of Life incessantly ministers the Law, and it was that stream that we called the Gods.

Out of the seas and the mountains,
And the depths of the rivers,
Some God will always be appearing, with rich
gifts for the good man,

said Taliesin the Chief of Bards; and certainly the wise ancients recognized that immeasurable justice was the same thing as immeasurable joy. Therefore they spoke of the golden life of those who are one with the Law, and all nature the throne and palace of its ministers. Aphrodite rose out of the foam, and Apollo charioted through the skies, and Aeolus unlocked his cave, and Poseidon ranged his gleaming, long battalions, not of caprice, but to work gladly the behests of that destiny with whom they were at one.

Bodily pains come from the breaking of law: you eat overmuch and unwisely, and naturally liver and digestion suffer. Such a fact would be plain enough to people who only rarely so transgressed, because the pain and the transgression it followed would both stand out in their lives, undisguisably connected. But with men who transgressed habitually, there would be no health and cleanliness for contrast and illuminant; ill-health would be normal and not much felt, and acute ill-health only attributable to the will of God: an extra-natural punishment, and not the natural result, of their sins. But in reality, all life is conspired to keep us within the bounds of the Law; and whether we talk of Law or life, the great Life of the Gods, let us have an end of this talk of blindness and ruthlessness and adamant and the death of beauty, and realize that if we kept the Law, we should be close enough to the ministers of the Law, and all their beauty and joy would flow through our lives. K. V. M.

Ceylon

A WRITER in the *Boston Transcript* gives an account of Ceylon, which is very eulogistic, though showing perhaps a trace of the tendency to consider it as a possible pleasure-ground or commercial field for other nations. As to its administration, although one has of course to be very careful in touching upon such a topic, the writer undoubtedly makes out a good case for the administrators. He describes the island as the most prosperous colony in Asia, though he not only shows that it is not a colony, but even indicates that its prosperity is largely due to that circumstance. For instance:

The native Sinhalese appreciate the fact that they have the greatest security and the least taxation in their history; and there is no legislative body to queer the governor.

It should be unnecessary to point out that British colonies have legislative bodies. Again: there is a civil service of judicial and financial officials and a foreign staff for forests, public works, and railroads, all of which are

government property. The population is divided into four elements: the English, who furnish capital and supervision for most of the enterprises; the Eurasians, people of mixed blood of various European nationalities; the native Sinhalese; and the Tamils or Indian immigrants.

These four kinds of people live together in harmony, partly because of the unquestionable supremacy of the English, partly because there is so much work to do that there is little jealousy between laborers, and partly because of the mild disposition of the Sinhalese. The essential key to this content is, however, the remarkable prosperity of the island, due to the good government and business ability of the English.

A useful catalog of the elements of prosperity: the good disposition of the people; plenty of work; and an able and conscientious administration.

Most people, we are reminded, know no more about Ceylon than that it is an island over which blow "spicy breezes," as Bishop Heber assures us in his hymn, which also, by the way, misleads us as to the pronunciation. It has been seized upon for identification with the paradises of sundry legends, such as the story of Sindbad and the Tarshish of Solomon. It is fitted to be "a pleasure-city for other continents," but one must express the hope that the welfare of its native inhabitants will be duly considered in the future as heretofore, and that it will not fall under an administration favorable to turning it into a pleasure-city for other continents.

Down to the time of its pacification by the English in 1830, the country had exported only precious stones and cinnamon; but since then it has made its money out of the cultivation of plants not native. The pearl industry has fallen into abeyance, the crop having failed. An illuminating remark is the following:

Nobody but an insider knows the exact source of the rubies, sapphires, catseyes, and other rare stones. . . . Diamonds are not a Ceylonese stone; and if they were, X— (a noted diamond monopolist) would see to it that the diamond fishery ceased.

All the tropical spices grow in Ceylon. Originally the English planted coffee, but a pest destroyed the industry and they substituted cinchona from South America; and when the price of that fell, they planted tea, now one of the staples. Cocoa has also been imported, india-rubber, cocoanut products; worked chiefly by imported labor from the peninsula, the natives preferring to work their own plots.

Ceylon has always been one of the most inaccessible of Asiatic countries, but roads, canals and railways have rendered it less so.

Respecting the antiquities, the writer says that, for its great age, Ceylon possesses very few memorials. There is no ancient sanctuary except a few rock-temples; no palaces; no great monuments; no ancient cities, except four sites—Sigiriya, Polonnaruwa, Mihintale and Anurâdhapura (all of which have been illustrated in the CENTURY PATH). The ancient city of Anurâdhapura was deserted in the 8th or 9th century and destroyed by Tamil fanatics; so that its beauty now consists rather in the scenic setting than in the architectural remains.

And Ceylon has a far greater antiquity than modern scholars are willing to admit. It is

the northern highland of ancient Lankâ, which was an enormous island in Lemurian times. Hence this portion of land has survived cataclysms which, long ages ago, carried surrounding countries beneath the ocean. It has been the home of the ancient Wisdom-Religion. From Lankâ, the Egyptians brought their Zodiac; so that the lore of Ceylon is even more venerable than that of the land of the Pharaohs. The records of Ceylon's ancient might and wisdom are not destroyed, though they may have been obscured and withdrawn; for there are those whose duty it has been to preserve such records, and who will guard them against destruction and profanation until the right time.

The cause of the decline of countries is to be found in the relapse of their people from the old standards of character; the source of their restoration is to be looked for in an awakening of the people to a renewed sense of responsibility. If ever people should be inclined to complain of the fact that they have been governed by other hands, they should remember that it is due to their failure to govern themselves; and they should thank all their protecting gods that they have had as good a government as they have had, when they might have fared much worse. And let them not listen to the subtle counsels of those who would seek to inflame them against institutions which, however defective, are probably the best under the circumstances; for it is much easier to criticise than to perform. At all events Ceylon is not yet a pleasure resort for all the world, nor a market for monopolists in resources; yet that is what it may very easily become if it rashly throws off the influences that now conserve and protect it. So long as the island continues to be as wisely ordered and contented as this writer says that it is, it has the best opportunity for bringing about the reawakening of character just spoken of. And, depend upon it, so soon as the people show themselves capable of self-government, the governors will be only too ready to give them every opportunity of sharing or assuming that somewhat arduous and thankless duty. The proper recognition of a nation's rights and interests does not consist in forcing upon it a premature "independence" such as could only expose it to the attacks of self-interested and disintegrating forces; but in recognizing its true merits and in encouraging every sign of real and genuine self-regeneration among the people.

The Gospel of the Great Inane

MORTAL Mind, hitherto misleadingly named common sense, has sustained heavy reverses in Wisconsin. As is said by the (New York) Nation,

A bill was introduced before the Legislature of that State, providing that, in connection with elementary hygiene, public-school pupils be taught how to avoid contagion and the commoner ailments. Thereupon protests began to pour in from all sorts of radical mind-healers; it would be sinful, they cried, to give children the impression that disease was real. Wisconsin papers say that this was the message in hundreds of letters and in long petitions. The Assembly Committee on Public Health, in spite of its three physician members, was overawed at the first hearing of the measure, and killed it.

It was high time that this same Mortal Mind got a set-back somewhere, and Wisconsin is the first of the States to have the cour-

age to do it. Poor parents, really needing the extra hour in bed, have hitherto dragged themselves out to give their children breakfast before sending them to school. They have wasted vast sums in providing them with toothbrushes and sometimes spectacles. That is all changed. Mortal Mind may pretend as much as it likes to see dental decay, myopia, astigmatism—and resulting dyspepsia and desk-bent spines; as much as it likes to see starvation-anaemia and tuberculosis. Immortal Mind will know better. Soaring in the pure regions of twaddling inanity—for the moment we speak as from the Mortal—it knows that there are no diseases. We may gluttonize, but there will be no dyspepsia; we may drink, but there will be no inebriation; we may be debauchees, but the systemic decay is unreal. This is a great light for those benighted thinkers in the world's wastes who have held that diseases are even *divine* pointers to the laws of right conduct, stimulants to compassion, to research, and to self-control.

STUDENT

The Church is for Dullards, not for Geniuses

THESE remarks by a clerical speaker at a recent church congress, on "The Alleged Incompatibility between Genius and Orthodoxy," seem to indicate that his idea of the church is that of a club of mediocre people. The previous speaker had come to the conclusion that the alleged incompatibility was real. This is a come-down for the church. The speaker also said:

WHY not leave those persons who are not willing to come into the church to get to heaven in their own way? We might let this large class alone. It is not the business of the Church to adapt itself to unusual types. If the great majority are satisfied with the Church as she is, we may safely let alone this distinguished remnant.

The Church is not the sole agent of Christ in bringing about the Kingdom of God.

All this suggests the query, "When is a church not a church?" One may well ask what is the church for; is it an agency for providing limited salvation and an optional gospel? If you want to be saved, you must believe this and do that—unless you prefer to do otherwise, in which case *also* you can be saved. Exclusive agency for the sale of admission tickets for all who would like to have them; others may go around to the other door. Christ says to the church: "You may save the dullards, I will provide for the geniuses myself."

The World of Religion

(CONCLUDED FROM PAGE 10)

we shall find the sentiment which inspires us with the sense of oneness with other beings. Thus we shall approach Divinity. Man was made in the image of higher beings than himself; he received his spiritual life from the "Gods" or perfected men of a previous cycle, which is what is summarized so concisely in the Bible, where it says that the *elohim* (Gods) created man in their own image. It is theological ignorance or misrepresentation that is responsible for confounding this with the Jehovah who is evidently a mere tribal God.

This pastor is trying to find the truth that he may not teach lies; but his church does not seem able to help him at all. STUDENT

The Welsh Language—Part I

TWO forces are growing into power, which at first sight one would say were incompatible, but which are really complementary, and neither can exist beneficially without the other. The one is a sane internationalism—all hail to it! In spite of all the evidence of Dreadnoughts the nations are drawing closer; we are more willing to concede humanity to the foreigner; and some day we shall lose the idea, that though there are many nations, only one of them is elect and heaven-protected, above fraternity and with no compeers. The other is nationalism—all hail to that also! The nations, and perhaps especially the smaller ones, are feeling more strongly than ever that down in the heart of each of them is to be found a higher self, a national divinity; to be sought after, cherished, and made potent in all affairs.

In language we find the same principles at work. There are three or four great ones that will carry you round the world, a kind of world currency; "everybody" has to know one or two of these. A few years ago it seemed as if there were nothing in store but death for all others; but now the condemned are busy forgetting their sentence. We find an increasing importance set on remote and ungeneral tongues; and nations that were fast growing alien in speech flaunting their own languages again with some assurance; making them living, cultivating their grammar and usage and literature; aiming at least at bilingualism. Whoever has lived in a bilingual country will do nothing but rejoice at this. The bilingualist is generally of brighter mind than his compatriot of only one language, especially if that one language be the alien one, the importation, and not the ancestral, natural tongue. When you grow up with two languages at your command, it is fairly easy to learn another and another. You realize that there are more than one set of vocal organs to be used, a discovery the monoglot makes with difficulty. You have an instinct for varying pronunciations and accent, which it takes him years and much labor to acquire.

No doubt, too, there are strange treasures of thought and feeling stored in many an odd corner of the earth, among races whose noon of greatness is remote and unremembered; and waiting there for the time when they may be of use to mankind. The Celts were at one time, as the scholars begin to believe, imperial in Europe; giving place, in the wane of their power, to the Greeks and Latins; and the Celtic languages, still spoken by four peoples, remain a link for us with prehistoric times and prehistoric grandeur. By that no outward magnificence of civilization is necessarily meant, but a certain inward state that we find glowing through the literature and construction of these tongues; a quick, vivid, mysterious beauty; a sense of human magnanimity, of the awe and dignity of things; an atmosphere wherein the sublime is always to be expected, as if this world

were, as no doubt it is, a court of the Palace of the Gods. Our modern languages have been built too much in ages of no wisdom and false wisdom; the building is not finished yet, and great things are to come, but over what there is we must own to a certain flavor of the commonplace. In these older tongues we sense an echo more august, more heroic, more magical.

Ogma, the god of speech—Gaulish Hercules, as Caesar calls him—led all men and things tied with invisible chains to his tongue;

Lomaland Photo. and Engraving Dept.

TOMB OF A SCALIGER, VERONA

his spoken words were potent over the soul of nature. It is he, with his magic of sound, Who maketh old-time, haunted deserts green, And setteth lakes where stiffnecked towns have been. And the winds of heaven, they say, grow calm and listen Sometimes, when the pearls of his chanted verses glisten: Or the stars themselves, forgetting their princely glories, Will lean an age from their purple thrones, to heed his stories.

He must have had some hand in the formation of these languages, for you are not allowed to lose sense, in the Celtic, of the

wonder-working power of sounds. There is a saying that you speak English with your mouth, but Welsh with your whole body—and soul too, for that matter. What appears, to the uninitiated, such a queer jumble of unvoiced consonants, resolves itself into a sound-system at once more highly vocalized than the Italian, and more consonantal than the German. There is nothing slipshod here, but all sounds must be made with freedom, with energy, one might say with earnestness. Broad, deep "ah's"; resonant, vibrant diphthongs, like the wind over the sea, like the long, withdrawing roar of the waves, like the clang of a shield falling on stone, in the oldest castle of the world; and these fitly enclosed and ramparted between combinations of consonants that it takes perceptible time to frame your lips to: *gum's*, *gw's*, *gur's*, of which you must pronounce each letter most fully, and with all circumstance—each must march in procession from you, so to say, with pomp of banners and music; smooth, fluidic *wy's*, very long and deep and gentle, like a wind far away among the pine tops; keen, clear *i's* (ee) like moonlight on the water; and keen, silky, half-whistled *u's* (with no English equivalent); *l's* with the breath of infinity blown through them, and made into *ll*, which for its subtlety of sound is harder for most foreigners to pronounce, than it is for a camel to enter the eye of a needle; sharp guttural *ech* softened into aspirate guttural *ech*; and perpetually, as in Greek, the *n* and *on* and *ion* that remind one of infinity, at the close of words and syllables—these are among the main sound-elements of the Welsh language.

Amaethon, Govannon, Einion, Goronwy, Keridwen, Elonwy, Myvanwy: with the stress on the last syllable but one, and every letter accorded the treatment of a prince in its pronouncing—you must go back to Homer for names half so stately. Have they not a Homeric sound, Greek music, and more than Greek mystery? Turn to the coo and reedy melody of Rhys Goch o Tir Iarll, and you will say it is surely the softest language in the world, and wonder what marvels Keats would have worked with it; turn to the battle poems of Gwalchmai ab Meilir, and you will say it is certainly the most strident and clashing. Turn then to the old poets, and you will a little pity Milton for his lack of it. KENNETH MORRIS

BUT the characteristic features of Spanish music, as far as they are to be distinguished from those of the national music of other countries, are certainly not Roman; and they are but to a very limited extent patriotic. They are the result, as far as it is possible to judge, of Southern and Eastern influences. The Basques have, no doubt, exercised some influence upon the music as they have upon the general character. But Spanish music is not Basque, and the inhabitants of the Castilian provinces that border upon Biscay are among the least musical people of the peninsula. The influence of the Troubadours of Provence and Catalonia was no doubt considerable during the thirteenth and fourteenth centuries, not only as regards poetry, but as regards music; but in neither case was the effect more than temporary.—Burke, *Hist. of Spain*

Yes, woman *did* lead man to the Tree of Knowledge, and had she been let alone and allowed to do what she intended, she would have led him to the Tree of Life.—H. P. Blavatsky

LOOKING back through the checkered roll of the centuries, it is a pleasant relief to find how many splendid women there have been in every land who were characterized by strength, wisdom, and dignity, and who stand out in bright relief as compassionate helpers of their own people. Their names ring like sweet-toned bells above the confused babel of their times.

Brigit of Kildare was one of those devoted souls, whose memory has been kept green in Ireland for fourteen hundred years, and many of her acts strongly remind us of her namesake, Birgitta of Sweden, who came about eight hundred years later, when the Church had lost its early morning freshness and was plunging into worldliness. The Irish Brigit lived at a time of religious construction, before political expediency had brought corruption into the Church. She was needed to help in the creation of new things, not in the reform of declining ones. The ancient Druidic faith was dying, and the wide extension of the new form of religion compelled earnest men and women, who felt the urge to do something practical for their fellows, to utilize the highest possibilities Christianity afforded.

Brigit, or Bride, modernized into the more homely Bridget, was a historical character who lived in the 5th century. She was the daughter of a prince of Ulster and a slave, and when a child, was sold to a Druid who educated her with care. It is said that she was converted to Christianity by St. Patrick, and under the oaks of Kildare she built her first cell (*Cil-dare*, cell-oak). Afterwards, at the same place, she established a unique conventual institution which included both monks and nuns. This was an entirely novel idea, and although it was successful under Brigit's supervision it was not much liked by the Church. Possibly it was too favorable to the women, who, according to the early Fathers, were the enemies of man, and the daughters of Belial! It is curious that the Teacher Birgitta of Sweden

Brigit of Ireland

founded her monastic Order upon the same principle of equality of the sexes. Birgitta's Order was approved by the Papacy in 1370 after much delay. The Mother-house was at Vadstena, on the shores of Lake Vettern, and it became a center of culture and enlightenment, the forerunner of religious freedom in Sweden.

But to return to our subject. That the Irish

THE PASSWORD

SENTINEL Time at the cross roads stands,
Ankle deep in the grass,
And a precious duty is in his hands,
Through the golden time of the year at its prime,
Guarding the forest pass.
The mocking bird lilteth a soldierly tune,
Flameth the shaft of the Indian plume,
And the wild pale laurel is full in bloom,
While the troopers crowd in a mass.
They fill the valley and climb the hill—
Phalanx of columbine, daffodil—
While the tree tops away to the echoing rune
Of their martial melodies, warbled in tune;
Sentinel Time, upon duty still,
Challenges all who would pass the hill,
But the crowds sweep through, for they've learned
full soon,
From a prattling sparrow, the password 's—June!
Mary Brent Wbleiside (Selected)

people held woman in as great honor in old times as they do today, or more so, is proved by the ancient pre-Christian legends; and that the strictures of the Fathers of the Church against the sex had not affected this can be seen by the high position of authority Brigit and her succeeding Abbesses held. They even enjoyed a certain supremacy over the Bishops of Kildare themselves, and Brigit's reputation was so high that she is said to have frequently assisted St. Patrick by relating her visions to

him. Once, says the legend, after listening to St. Patrick preaching for three days and nights, even her endurance gave out and she slept. In her dreams she saw white oxen in white fields, followed by darker ones, and then all became black; finally she saw sheep, swine, dogs, and wolves quarreling. It seems that this was not the effect of the desperate length of the sermon, for St. Patrick said it symbolized the future of the Church in Ireland. What did he mean? Another time Brigit had a vision of the future of Ireland; the first glance showed her the mystic fires on the hills burning brightly, but soon they began to die out, and at last she could see nothing but a smothered gleam here and there in the caverns and in the hearts of the mountains.

Brigit must have seen that, for the time at least, the new creed had definitely conquered the old Druidic faith, and that to give effective help to her people she must work through the forms of the foreign religion. It is very likely that her early Druidic training was never quite overpowered, and probably she held the opinion that St. Augustine had enunciated shortly before, that

the thing which is now called the Christian religion really was known to the ancients, nor was it wanting at any time from the beginning of the human race until the time when Christ came in the flesh, from whence the true religion, which had previously existed, began to be called "Christian."

Brigit became, in the popular tradition, the patron saint of learning. She lived at a time when the desire to study Hebrew and Greek was becoming general, and a large number of schools were established throughout Ireland during the 5th and 6th centuries. These schools were veritable seats of learning; in them rhetoric, grammar, poetry, arithmetic, Greek, Hebrew and Latin, as well as theology and the natural sciences were thoroughly studied. Modern scholars have expressed astonishment at the profound knowledge of

Greek and Hebrew possessed by the students trained in these early schools of Ireland at a time when continental Europe was plunged in intellectual darkness. In many of the famous Irish seats of learning as many as 3000 scholars were found at one time. Brigit, though her greatest efforts were directed to the creating of a great intellectual and spiritual center at Kildare had evidently a proper appreciation of practical needs, for an important school for metal workers is mentioned as having grown up under her care.

In connexion with the character and life of this admirable woman it is interesting to find that the legends clustering around her name offer good examples of the early Christian custom of appropriating the attributes of heathen deities. H. P. Blavatsky gives many curious instances in her works. The god or goddess was usually re-christened, but in this instance it seems to have been thought unnecessary to change the name of Brigit.

The good saint's predecessor and namesake, the Goddess Brigit of pre-Christian times, was famous throughout Ireland. She was the daughter of the Dagda, the "Good God," the Father of the gods in many legends. She was known under three aspects, Brigit of the Poets, Brigit the Healer, and Brigit of the Fire-Smiths. This tripartite character was appropriated with little change by the Church to her successor and namesake, who is called Brigit of the Poets, Brigit of the Mantle, and Brigit the Foster-Mother of Christ! Both Brigit's are particularly noted for their love of literature.

Four votive inscriptions of the Roman period have been found in Britain, and one in Gaul, dedicated to the goddess Brigit, the patroness of learning, but none in Ireland. It is curious that no statues of the gods have been found in Ireland; we have to depend upon the ancient bardic tales for most of our information about Irish mythology. According to the oldest writings no date can be assigned to the origin of the use of letters in Ireland. The Goddess Brigit is the mother of the Tuatha de Danaan, the demi-gods of the golden age, who have been driven to protect themselves by becoming invisible to common sight owing to the degraded state of the world. Some day they are to return, and then the mystic fires will be re-lighted in Ireland and all other countries. IRISH STUDENT IN LOMALAND

Religion and the Public Schools Again

THIS is a live question just at present, and the fact is a hopeful sign. It shows that some great lack in the school system is being keenly felt, and it shows to what confusion theology has finally brought the human mind. It will probably be one of the means by which all will learn, beyond a shadow of doubt, that theology is *not* religion.

There has been heretofore, and of course there is yet, the stupendous delusion that creed and religion are one; for the instant it has been suggested to bring religion into the teach-

ing of the young, there has been a great hue and cry from the representatives of all the hundreds of sects, each insisting that the religion taught should be his own; and they have fought like dogs over these dry bones of theology while the children have gone hungry. No one has wanted to have anything to do with any theories but those he has himself adopted as true, and yet there is something which all want. What is it? Truly it is religion in its very essence. The Soul of the nation is beginning to utter a conscious cry, and to refuse forever to be fed on husks.

What has theology ever done but to set at variance the members of the great human family? The unity, love, harmony, charity,

est, open word about it, as will bridge over all suspicion between sects and religions, and convince them all alike that there lies herein a common interest for all to uphold in joint harmony—that they can uphold it when they understand it, without sacrifice of or apology for their distinctive convictions.

Theosophy is that voice, and it *has* spoken the great, honest, open word. It has solved the problem. It has established schools—and Sunday Schools as well—which are *unsectarian*. It has opened the door to the soul life. It has pointed the way to the common ground, where all religions can live together in peace. It is awakening every day the essence of religion in the hearts of the children. In the schools founded under its teaching, Jew, Mohammedan, Buddhist, Christian, are together and in peace, being led to find the key to their own natures, and to come closer to the heart of the universe.

How petty, how pathetically small, in the light of these broad teachings, seem the little disputes over man-made creeds. With all the vast issues at stake in the complicated life of today; with the swelling cry of despair to which no ear can be dull, and with the mighty possibilities before us, can we afford longer to lose sight of the real needs in jealousies over dogmas?

Teach the children that they *are* Souls; feel that they are Souls; live and act as if they were Souls, and recognize the fact which *all* religions have taught, and about which there can be no dispute, that all have a higher and a lower nature, with the infinite possibilities of either good or evil before them. No text-book for this is necessary. No special set-apart study hour will be needed, nor will answer for this. But like a living, breathing fire let it warm every moment of every duty; like an under-current of joy let it transform every task; like a subtle influence from above let it dignify every existence.

Then no one will complain that religion is not being taught, and none will ask, Is it mine? or Is it thine? But the children who go forth from that school will carry a cloud of glory with them which will shine into the darkest corners of the earth.

GERTRUDE VAN PELT

A STATUE IN THE GARDEN AT VERSAILLES, FRANCE

compassion, taught by all the great Teachers, has been combated, obscured, often utterly destroyed, by theology. Who, then, has taught the people theology? Certainly *not* the great Teachers, and instead of this and religion being one and the same thing in reality, as they have been in the public mind, they are, on the contrary, utterly opposed and have no life in common.

"There is no religion higher than Truth." The Truth is in every religion, is the same in all. All, in their deeper natures, love the Truth; and all want their children to learn the Truth. It is very simple; and the fact that there is so much controversy only shows how far we have wandered from nature. Here and there the true thing is being sifted from the medley. A writer in the *Chicago Interior* says:

So all that's wanting to crystallize this potential unity, is for some voice to speak such a great, hon-

The Japanese Woman

BARONESS Uriu, wife of the noted Admiral Uriu of Japan, said recently upon the occasion of an interview with the ubiquitous American reporter, during the visit of the Baroness in New York:

America may be ready for the woman in politics—I have not been here long enough to form an opinion upon that subject—but I am very certain that the women of Japan do not want the ballot, nor do they need it. Personally I do not believe in the ballot for women, but I do believe in the highest mental development for them and the broadest opportunities. I think woman's sphere and man's are almost wholly different and that the nature of their usefulness must necessarily differ. But woman's place, with very rare exceptions, is in the home. It is in the home that the Japanese woman finds not only her greatest happiness but her duty in the fullest sense of the word.

Baroness Uriu was for a number of years a student in an American college. STUDENT

OUR YOUNG FOLK

THE FLOWER OF LIBERTY

WHAT flower is this that greets the morn,

Its hues from heaven so freshly born?
With burning star and flaming band
It kindles all the sunset land:
Oh, tell us what its name may be—
Is this the flower of Liberty?
It is the banner of the free,
The starry Flower of Liberty!

Behold its streaming rays unite
One mingling flood of braided light—
The red that fires the Southern rose
With spotless white from Northern
snows

And, spangled o'er its azure, see
The sister stars of Liberty!
Then hail the banner of the free,
The starry flower of Liberty.

The blades of heroes fence it round;
Where'er it springs is holy ground;
From towns and domes its glories
spread;

It waves where lowly sentries tread,
It marks the land as oceans free,
And plants an empire on the sea.
Then hail the banner of the free,
The starry Flower of Liberty!

RAJA YOGA CHILDREN IN THE GREEK THEATER AT POINT LOMA

The Higher Patriotism

SINCE July 4, 1776, when the United States of America declared their independence, so many countries have followed in their footsteps that it is as easy to count as many as thirty republics. Monarchies have also become so thoroughly republican in their government, that people who live under this form of rule are as free as in a republic; and, wonder of wonders, it seems that even Oriental despots, who so long entirely disregarded their subjects as beings possessed of rights, can be taught to rule according to constitutions which respect the right of every individual.

The American colonists won more than their own independence; they initiated the long series of struggles which have overturned the old, worn-out methods of the past; they encouraged all the other nations to reconstruct their institutions on new lines; they gave an impulse to the formation of new, free nations. This work of re-adjustment of the means of governing, and of uprooting oppression, has gone on ever since. Is it not time for a glorious new impulse of helpfulness to surge over the world from America, the great Land of Promise? On this free soil has there not been developed from the seeds of heroism planted by the Fathers of the United States, a higher patriotism, which can yield a great blessing to the world?

"To make men free"—how these words have rung out, arousing heroes in many lands. What a roll-call is that of the names of those who have fought and lived and died for liberty. The times of struggle have brought to the front brave sons of nations as different as human beings can be, but always with the strength of soul to sacrifice all on the altar of their country. We cannot celebrate a Liberty Day without remembering with Washington, Paine, Jefferson, Franklin, Hamilton, and

their brave host of helpers, the honored patriots of the other American republics, Hidalgo, Morelos, Juarez and Diaz, of Mexico; Miranda, Tupac Amaru, Murillo, Sucre and Bolivar, of the southern continent; and Cespedes, Garcia, Gomez, Marti and Maceo, of Cuba; not to mention the great patriot souls in the Old World who have labored for unity and freedom.

Oppressed in the old way, deprived of the rights of men, the people can not long be in any land, now that these liberators have done their work. But men are not yet really free. They have found that even when the hand of oppression is lifted, there is still something which weighs heavily upon the people. It is selfishness; and there are many many forms of selfishness even in the countries whose freedom was won by the unselfish devotion of great heroes. Those who truly love their country will not let their enthusiasm for its greatness blind them to the fact that the supreme quality in those who would serve as patriots, is unselfishness. When we study about the heroes of 1776, it seems that their wisdom, their devotion, their self-sacrifice, had sounded a call to the New World to produce citizens whose patriotism would ever progress along unselfish lines. The Fourth of July is a good time for the young folk, the future citizens, while they are stirred anew by the spirit of the day, to see if they be answering the challenge given to them by the great Fathers of the Republic.

The higher patriotism of 1776 gave the world a Land of Promise. Here have flocked from the older countries representatives of many races and nations, lovers of liberty, ready to be pioneers in building the new nation which should be the flower of past hopes and efforts. It is but natural to expect from a nation formed under such auspices and of so many sturdy elements, a something strong

and true that shall be an example to the whole world, as inspiring as was the work of the heroes of 1776. It is living day by day faithful to the ideal of devoted service to humanity which will enable us to fulfil the promise.

Signs are not wanting that the spirit of helpfulness to the world is the mainspring of the nation's greatest helpers today, but how much stronger and more compassionate could their work be if in the hearts of all who love their great country were the spirit of Brotherhood. The hero-helpers of the time when the United States of America won independence, were inspired by love of Freedom; the higher patriotism of this later day asks for a new inspiration; its scope is broader; its ideal is to help all nations to live in the spirit of Brotherhood. A RAJA YOGA PATRIOT

Quotations from the Writings of Katherine Tingley

IN America must be built up the new and glorious manhood and womanhood that will be an example of purity to the world.

THE men who wrote the Constitution of the United States were far from ordinary souls. The full spirituality which they have embodied in it will become more apparent every day, and our children's children will hold it more sacredly than we.

AMERICA must rise to something more than commercial prosperity or intellectual advancement. I believe that this great country is the chosen spot for solving some of life's greatest problems. But we must become more united, and recognize that Brotherhood is a force in Nature. We must live up to it in all the smallest duties and all the time. If we learn the necessity of right living and justice to all, we shall not have to wait for the Kingdom of Heaven.

THE CHILDREN'S HOUR

Merton's Fourth of July

"I AM not going to have any fire-crackers this year," said Merton Owen.

"You're not?" exclaimed Robert Willis, "Why?"

"O, Father talked me out of it," Merton replied.

"Talked you out of it! Well, I should like to see anybody who could persuade me not to have fire-crackers on the Fourth of July. Not even one bunch of little ones, Merton?" Rob said.

"Father says that it is not true patriotism to fire off a lot of gunpowder and make a big noise to keep in mind the battle part of the War for Independence. Powder is a destructive force and destructive forces are on the evil side of nature, and although they are still used in war, it is the wrong way to settle trouble and must eventually give place to a more enlightened way of making peace. That's what Father says," said Merton.

"But, Merton, how are you going to celebrate the Fourth?" Rob said, looking very much troubled.

"Well, Rob, my father has made me see that it is a low kind of patriotism to celebrate in the old way, the anniversary of the freedom of our great country. He says that the future of the country will rest with us boys when we grow to be men, and he wishes us to learn something of the higher patriotism we should feel, and realize the responsibility which will be ours someday, and he says we should be glad we were born in such a great country. This is what we should feel patriotic about, and gunpowder is not needed with this kind of patriotism, he said," Merton explained.

"Yes, but how are you going to celebrate the Fourth without fire-crackers and have any fun?" Rob said.

"Well I am going to try the higher patriotism this year and father says that as many of the boys who are willing to give up powder and celebrate in a better way, may meet him at nine o'clock at our front gate on Fourth of July morning; girls too," and Merton flung up his cap.

"If I thought it was a picnic," said Rob, "but I —"

"No buts or ifs about it, Rob," said Merton, "I know father; he always helps us in giving up to a better thing and he always knows what girls and boys like. You can think about it over night." And off ran Merton.

When Robert arrived at Mr. Owen's front

"NOW IT'S TIME FOR A STORY"

THE FLAG

LET it droop in graceful rest
For a passing hour—
Glory's banner, last and best;
Freedom's freshest flower!
Each red stripe has blazoned forth
Gospels writ in blood;
Every star has sung the birth
Of some deathless good.

Let it droop, but not too long!
On the eager wind
Bid it wave, to shame the wrong:
To inspire mankind
With a larger human love;
With a truth as true
As the heaven that broods above
Its deep field of blue.

Till a flag with some new light
Out of Freedom's sky
Kindles through the gulfs of night,
Holier blazonry.
Let its glow the darkness drown!
Give our banner sway,
Till its joyful stars go down,
In undreamed-of day.

Lucy Larcom

gate on the morning of the Fourth, he found a large four-horse tally-ho there and many baskets were being carefully stowed away under the seats. Flags were flying and there was plenty of enthusiasm as the children clambered into the wagon, but not of the fire-cracker kind.

When they returned late in the evening there was not a boy or girl who was not ready to declare that it was quite the happiest Independence Day ever spent. They were brim-full of patriotic feeling; for Mr. Owen had thrilled them with his talks about George Washington, Thomas Paine, Lafayette and other great heroes. He told how Washington's great heart had been wrung with the sufferings of the brave men he commanded during that terrible winter at Valley Forge; how he had inspired them with his great faith and courage when there seemed but little hope, because he knew it was but the price to be paid for their country's freedom. Mr. Owen spoke to them of the wisdom of these great men, their self-control, their knowledge in so many departments which made it possible for them to take command and direct such a great undertaking. He pointed out to the boys that it was love of country, the true patriotism, and the unselfish desire to help others which

made it possible for these men to become great in the first place.

Mr. Owen then recited some of the fine sayings of some of these brave men and a few of the boys made speeches which were cheered and applauded, while Mrs. Owen and the girls gathered leaves and flowers and made wreaths for all the great patriots and laid them in the center of the happy group in the grove. Then Mrs. Owen declared that the woods was the only place in which to celebrate the Fourth, "for Nature always inspired one with high thoughts and feelings and love for better things."

All the way home, they sang the national songs, and as the sweet strains floated out on the night air, many who saw them pass said, "That is the way to celebrate Independence Day, it is ever so much better than gunpowder. Next year let us try it too."

"The best thing about it is," said Rob, "that it was not only a picnic; we had a good time, but that was not all. I feel different. I feel like serving my country."

"Choosing the better way always makes the heart glow," said Merton. EUGENIA

THE SECRET DOCTRINE

THE MYSTERIES OF THE HEART DOCTRINE

PREPARED BY
KATHERINE TINGLEY
AND HER PUPILS

The Theosophical Book *of the* Twentieth Century

Tells the story and the history of the Theosophical Movement.

The prices are \$2 in cloth and \$1 in paper, which barely cover the cost, for it is printed and bound, not gaudily, but with such carefulness and thoroughness of art and craft as to make it unique among modern edition books.

ORDER FROM THE
THEOSOPHICAL PUBLISHING CO., POINT LOMA, CAL.

Isis Conservatory of Music OF THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY POINT LOMA, CALIFORNIA

J. H. FUSSELL, SECRETARY AND TREASURER,
ISIS CONSERVATORY OF MUSIC, Point Loma, California

SOME OF THE ERRORS OF CHRISTIAN SCIENCE CRITICISM

BY H. P. BLAVATSKY AND WILLIAM Q. JUDGE

CONTENTS

"The Empty Vessel Makes the Greatest Sound"
A Note of Warning
—by H. P. Blavatsky

Of "Metaphysical Healing"
Affirmations and Denials
The Cure of Diseases
Replanting Diseases for Future Use
—by William Q. Judge

A MOST VALUABLE PAMPHLET. Outside of Theosophy there is given no adequate explanation of the healing that is at times accomplished, nor of its rationale, nor of the ultimate price that must be paid and the dangers connected with such practices.

This pamphlet is invaluable to all students.

Immunity from Disease

IN "The Mechanism of Immunity," an article from *Cosmos* in the *Scientific American Supplement*, the writer gives some facts which are interesting as revealing the workings of the lives that enter into the constitution of the human body, but misleading if they are taken as in any way justifying the system of inoculating with antitoxins.

A person attacked by a disease of microbial origin becomes immune to that disease for a shorter or longer period, or even for life; nay, the immunity can sometimes be transmitted to offspring. An infant whose mother has been vaccinated shortly before its birth is born immune, and will not, for several months at least, react to vaccination. Lucian describes an African tribe which enjoyed inherited immunity to snake venom and allowed its newly-born infants to be bitten by snakes. Dr. Calmette has confirmed this by his experiments on immunizing animals to snake-bite.

Phases of Experience

Certain diseases which were very fatal when they first appeared in Europe have become comparatively mild; and the harmlessness of certain microbes which we habitually carry about may be explained in the same way. In cholera epidemics persons not stricken may carry about enough microbes to infect somebody else.

Microbes live in the body as parasites and produce disease when the resistance of the organism is lessened by exhaustion, exposure, or other cause. If a guinea-pig is inoculated with the virus of tetanus, the white corpuscles of the animal's blood engulf the germs and slowly digest them; but if, during the period of digestion, the vitality of the white corpuscles be lessened by heat or some other chemical or physical agency, the animal is attacked by tetanus. In the same way the human body possesses an immunity to tetanus, unless weakened.

After the body has successfully neutralized a poisonous influence, the blood has acquired thenceforth the power to do so easily, and the person is immune. The blood now contains something it did not contain before. Sheep's blood injected into the peritoneum of a rabbit is absorbed, and the rabbit's blood acquires the power to dissolve and destroy sheep's blood, even outside the body; this power has been traced to the presence of two distinct substances. Every kind of bacillus develops its specific neutralizer.

The most important point in the above is

that sound health is the best preventive of disease. Surely this, therefore, should receive greater attention than all the drugs and antitoxins. We see, too, that it is possible to carry about the germs of a disease for an unknown period, ready to attack us any time we may chance to be physically off our guard; so that one can never say with certainty when the disease was first caught. The body is, in fact, the lodging-place of all kinds of lives, beneficial and injurious. Very important, also, is the idea that though apparently healthy and actually unailing ourself, we may be the means of infecting others.

Artificial Half-Way Process

The danger of such investigations as these is that they may seem to lend color to the system of inoculating the human body with various injections and cultures for antitoxic purposes; but experience tends to show that such artificial devices are on the whole attended with more risk than benefit. Apart from the fact that imperfect knowledge leads to the unwitting injection of other influences than those intended, the artificial stimulation of the body's recuperative power has its compensation in a reduction of its power to resist other sorts of disease. We render a person immune to one disease but increase his liability to other diseases; or we introduce other poisons along with the lymph. As just pointed out, the natural soundness of the body is the real immunity, and health the best antitoxin. The practice of deliberately introducing poisons into the body is a kind of backwater in science, and its connexion with experimentation on living animals is an association that augurs but little good for its achievements; for what real benefit can accrue from cruelty?

External Palliatives Disastrous

It is beside the mark to point to successes achieved by such methods, unless we can affirm (1) that no compensating evil has been inflicted, (2) that greater successes would not have been achieved by other methods. It may reasonably be argued that medical science is wasting its time in devoting so much labor and talent to doubtful and inferior methods when it might be achieving far more along other lines.

To illustrate this. What could be more fatuous and futile than the attempt to combat the "great white plague" by such means, when everybody knows perfectly well what are the real causes and therefore the real cures. When whole nations are vitally depleted and contaminated by numerous forms of unclean living—secret and otherwise—attacking children even in the cradle, pursuing them through childhood and adolescence, what wise

man would waste his time in trying to resist the consequences by antitoxic methods? As well administer beef tea to a man bleeding to death, without first binding up his wound.

And the temporary success of such methods is their greatest danger; for it is like smothering a fire or whitewashing a foul place.

The *causes* have not been removed. People indulge vice and uncleanness and carelessness until they bring about a disease; a doctor invents an inoculation and smothers the disease; but the causes continue as before, and must either accumulate for a worse outbreak or find another vent. And indeed we find that new diseases appear faster than the old ones are overcome.

Thus we are wasting time trying to push the dent out of a rubber ball or to dam back a torrent with mud, and crowing over our temporary successes. Valuable and necessary as physical methods are, they are second in importance to the science and methods that deal with the causes of disease. The fact that we are so lamentably deficient in such kind of science enables those whose attention is directed exclusively to the physical plane to plume themselves upon a practicality and common sense. Yet for want of the wider science, the field of physical science is limited and confined; for it is not possible to mark off Nature into compartments. H. T. E.

Communicating with the Spooks

IT is a most striking sign of the changing times that the London *Fortnightly Review* should have printed an article by a well known London journalist seriously proposing to establish forthwith a bureau of intercommunication between this world and the world beyond. Many staid old folk will be wondering what dream-world they have gotten into. It is almost incredible, yet true; and it shows what we are coming to. The dabbling in the occult has passed from a disregarded fad to a seriously considered business, worthy the attention of a staid and accredited organ of respectable opinion.

The maker of this proposal professes to be a religious man; yet he must surely keep his religion in a separate compartment. If not, then is it not a very curious religion that can think of the souls of departed friends in such a way? Can it be possible that our immortal Souls, when freed from this carnal vesture and delivered awhile from the troubles and follies of this life, should pass to another world, wherein, according to this writer, they seem to be in pretty much the same straits as they were here? Are we to be occupied after death in making frantic efforts to get into communication with people on earth; and are our Souls to be at the beck and call of the duly licensed and authorized mediums of the Bureau of Intercommunication?

Needless to say, no *Soul* ever communicates in such a way; and if it communicates at all, then it is not by words or any recognizable evidence whatever, but by the silent unrecognized inspiration of its *true* and now sublimated love. All that can communicate is some spook dressed up in the astral remnants of the deceased; or, more probably, borrowing its shape from the pictures in the sitter's own mind. Nay, the supposed spirit may be

no more than an extrusion of a part of the sitter's or medium's astral form; and the pen which writes down the automatic message may be actuated by his subconscious mind. The imagination can body forth things in a much more literal sense than is generally thought, and we all have the power to create Frankenstein monsters. But what is quite certain is that the door of communication will be opened to all and sundry in the world of spooks and shades, and we shall have an irruption of the dead among the living that will work havoc with people's nervous systems and morals.

For the people who are conducting this business excel in one quality—their unfathomable ignorance of the subject.

The danger of such a thing to modern civilization is obvious, especially if we may estimate its future possibilities by the rate of its recent growth. Look ahead ten years and try to imagine where we shall be then! It was partly to guard against this that the Theosophical Society was founded, and well it was for humanity that someone was clear-sighted enough to see a few years ahead, and devoted enough to do something. For the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY is the one clean and wholesome, sane and intelligent power in the whole range of occultism, the only influence that can guide and save humanity in the terrible mess it is getting itself into. And the world will very soon find this out. Meanwhile let all who value their health and sanity keep clear of the psychic whirlpools. STUDENT

Japan and Christianity

A DAILY paper prints the heading: "Japan is Slowly Becoming a Nation of Christians," giving Ambassador Takahira as authority for the statement; but a perusal of the ambassador's actual statement, as reported below, scarcely bears out this title. He said his people were great thinkers, anxious to get at the truth, and that the religions of his country had a great hold on them. The work of Christian missionaries was bearing fruit rapidly, but his opinion was that it would take a long, long time to Christianize Japan. Thus he made two statements unfavorable to the view and one statement which is ambiguous. Let us turn to a Japanese newspaper.

In the *Japan Advertiser* (Yokohama), we find an article headed: "Japan Searches for a Broader, More Enlightening Moral Force." The writer says that Japan's success in the war with Russia was due, in the opinion of the Japanese, not so much to the Western science and methods adopted, as to the unconquerable spirit of the men inspired by Bushido, the national knight-errantry. It was this code of honor that won the victories; but it has suffered under the influence of Westernism, which has introduced a meaner spirit. The people still preserve, however, a deeply-rooted attachment to their ancient spirit and traditions; but the writer fears that the old forms in which this spirit was preserved cannot be successfully revived. The people, therefore, are searching for a new moral code to take the place of the bygone ones and to preserve the national spirit of loyalty and honor.

Now let us see if Christianity, the maker and product of Western civilization, shall become the faith

of the westernizing Japan. Christianity in its European or American form, "with more of Anglo-Saxon freaks and fancies than grace and purity of its founder," can never be accepted by the Japanese. Conversion of Japan into Christianity can only be accomplished by leaving the honorable effort to the Japanese themselves.

The missionaries ruffle the national pride by despising the national traditions. But they cannot ravage the country and plant Christianity on the ruins, as they might do in the African wilds. In attempting to plant the kingdom of Jesus on the soil of Japan, the missionaries should remember that Japan's civilization goes back 25 centuries. It would be more fitting for them to be satisfied by introducing the fundamental principles of the religion they profess and to leave the rest to the people themselves. And the writer concludes:

Yes, Japan is in search of a religion, and it must be thoroughly Japanese, if not by origin, at least by transformation.

One can readily understand that the Japanese will not adopt any one of the numerous sectarian creeds which go by the name of Christianity; and that in testing the fitness of that religion, they will plumb it to the bottom in search of its fundamental and essential principles. But if they do this, they will reach a result similar to that already reached by a good many Christian clergymen of advanced views; they will find that the essential truths of Christianity are those which are held in common by all religions, and that those features which give Christianity its peculiar character as such are not essential. In fact, the process of stripping off the dogmatic and unessential part of Christianity results in depriving it of all claim to be a special and paramount religion. If it be based on the personality of the historical Jesus, then we find that Jesus is a traditional character for whose actual existence there is very scanty evidence. If it be based on the authority of his sayings, we find that these have been much altered and added to by the recorders. If the authority of the church be made our standing-ground, the Japanese will ask, "Which Church?" and not one of them has satisfactory credentials. If, finally we base Christianity on its ethical teachings, we find that these are common property to all religions and not peculiar to Christianity.

And unfortunately for Christianity, its principal ethical teachings, those germane to the pure science of life, have been made subservient to ideas of personal benefit in another state of being; and their true value, and purport, have thus been sadly distorted and perverted.

The problem that faces aspiring peoples is to discover the best means of adapting the changeless universal religious truths to the altered circumstances of the present and coming age. While Japan may perhaps find in Christianity a few suggestions—especially as indicating what to avoid—it can find the essential spirit of religion without going to Christianity for it; and as to the outer form, Japan undertakes to provide that itself. Perhaps in a few years, when the failure of Christianity in the West has become more obvious, and the power of Theosophy as the one agency that can help has been made more manifest, the Japanese may be better able to see where to look for aid. STUDENT

Some Views on XXth Century Problems

The Subconsciousnesses

THE new schools of thought must learn to separate the heavens from the earth before they will understand man. At present they have gotten them mixed in a chaos which they call the subconscious. Sometimes they deify this chaos and call it our link with the Infinite, part of the Infinite Being Itself; at others, it is some power which we use to heal our diseases; again it is both and we can summon the Infinite to move our sluggish livers.

The subconscious is *within* consciousness, but not within the field of attention. A man who was looking at an acrostic whose letters were printed in red here and there through a close page of print would *see* all the other letters but *attend* only to the red ones. If one reads through a list of words in a foreign language with their meanings, it may appear afterwards as if none of them had been retained; waking in the night, the picture of the page may float quite clearly across the field—now almost empty otherwise—of attention. During the day many other things were much more predominantly and insistently in the foreground. It is possible that if we could banish everything else from attention we should become conscious of many or even all of those physiological processes which we now regard as in the *unconscious*.

But all this field is *earth*, terrestrial memories however immeasurably detailed; physiological doings however microscopically minute or electrically swift.

Every morning man incarnates, coming into contact moment by moment with more and more of the throng of his terrestrial memories, his hopes, fears, antagonisms; with the world of the senses and of his physiology; with his surroundings. In a few moments he is once more in the whirl of his personal life. There is now another subconscious. That of which and in which and as which he was conscious before incarnating, in deep sleep, is now as dim *behind* his dreams as the dreams are dim behind the waking world of his attention. This was the classification of consciousness in some of the old philosophies: the waking, the dreaming, and that of deep sleep. But sometimes they inverted our order and what we call waking they called sleep—of the spirit; and what we call sleep was for them the waking of the spirit, the waking of the man to his state as spirit.

This is the other subconscious; but how different from the first! If we could gain that—as is possible—during waking life, illuminating the latter by the light of the former, the same light would get down into the other subconscious and we should understand our own physical nature. Indeed there is no other way to a final understanding of that. Until then, physiology will remain an objective science.

How is this upper subconscious to be gained? Only by finding in oneself that part or place or state where the welfare of all that lives is desired, the point of all-radiating benevolence; holding to it against the resistance of

the mind; carrying it throughout some time daily to its highest point; and trying more and more fully to have it as a mental background and motor of conduct throughout all times. If a man would know that Power which sustains all things and carries all things age after age to higher levels, and enfolds and encloses all things with an ever brightening light, he must try as best he may, as best he can at any time conceive, to act likewise and to create or reach the feeling necessary for such action.

STUDENT

Mysticism and Hysteria

THE increasingly numerous books and articles on mysticism and the mystics now appearing, whether favorable or critical to the point of hostility, confuse the issue by their very title. For there is no such line as has on one side of it the mystic and on the other the ordinary man. The latter, in his degree is also a mystic.

Science considers that a molecule or an atom can be adequately known by processes of observation and thought. But would these same processes of measurement, observation, and thought thereon, reveal to a man his mother? They would reveal a particular female form behaving in certain fixed ways under appropriate circumstances. Her whole life's behavior, as mother, might be tabulated and exact laws perceived. But is it in any such ways that the man knows her as mother? Certainly he may know her so as person and woman; but to him she is neither; within them she is mother. Processes of thought do not apply to his knowledge of her as mother. He knows her as such by an experience in another part of his consciousness than that which works as thought. And he knows that this continuing experience is an immediate knowledge of her inner self as mother. Those who are poor enough self-analysts to think that this knowledge is merely an ingrained memory, now not particularized, of all the things she has done for him, might consider whether it would have been possible for them to have developed the same feeling for some elaborate machine which had done the same.

The ordinary man, then, is a mystic in respect of his immediate knowledge of his mother *as mother*, a knowledge arising in a part of his consciousness which is other than that which reasons. It is with that same part, reasoning being held quiet, that the mystic searches for the divine. When he has found it, he knows it in another way than by thought, though thought may subsequently occupy itself with the knowledge. Life is now transformed. Every duty is henceforward golden. It should be as natural to men to do this as to cultivate their inner knowledge of their mothers as mothers.

So complete is the usual ignorance of mysticism, resulting from the vicious treatment of it as a special phenomenon, that a reviewer *contrasts* with the mystical life (as he has mistakenly conceived it) one which he very naturally admires and which is the mystical life itself, to him the ideal life.

For there is an ideal of a genuinely spiritual life realized in each fleeting moment of time. Such a life would transmute all our human powers into earthly forms of truth, beauty, and love.

But such a life could not be lived unless the divine were known either instinctively as a man knows his mother as mother, or by conscious spiritual use and culture of that part of consciousness concerned—as a man might in the same way develop his inner relation with and knowledge of a mother worthy of it.

The same journal, on another page, reviewing another book, exhibits the current confusion between the elevated sanity and even commonsense of mysticism with emotional hysteria. It speaks of

the abnormal element which almost invariably attends the more pronounced types of mystic experience, the nervous instability and the depression, often intense and prolonged, by which the devotee purchases the moments of emotional exaltation.

True mysticism is exactly the path away from such states, and is their cure. STUDENT

Broken Light

PROFESSOR JAMES, fond of giving us glimpses of foreign and by-way philosophies, and doing it very well, gives one in the current *Hibbert* of the system of Bergson, the (comparatively) young French thinker.

The essence of the system might be said to turn on the fact that the mind continually spoils realities, immediate knowledges, by attempts at close analysis of them. To represent living and continuous actualities to itself it has to divide them into little bits and thus kill them. Change, for instance, is continuous; time is continuous. Motion is perfectly known to us—until the mind begins to get hold of it conceptually. Then, in defining motion, it leaves the motion out. Motion is conceived as "the occupancy of serially successive points of space at serially successive instants of time." But this

gives *positions* assignable *ad infinitum*, but how a body ever gets from one position to another it omits to mention. The body gets there by moving, of course; but the conceived positions, however multiplied, contain no element of movement.

So with time; the mind has to conceive it as broken into bits which do not move.

Take any such process of change, as, for example, twenty seconds of time elapsing. If time is infinitely divisible, they simply cannot elapse, their end cannot be reached; for no matter how much of them has already elapsed, before the remainder, however minute, can have wholly elapsed, the earlier half of it must first have elapsed. And this ever-re-appearing need of making the earlier half elapse *first* leaves time with always something to do *before* the last thing is done, so that the last thing never gets done.

The common mind, dealing with the world, does so by altering living continuousnesses into unliving separate particles; then, if it presses its own conceptions, it finds they do not work.

But it does not follow that we have no process of consciousness which does not do that, which *does* conceive a living and continuous universe under the broken show which mind constructs from its swiftly successive glimpses. It is the operations of mind that are the real discontinuum, reflected outward. STUDENT

Archaeology Palaeontology Ethnology

The Illustration

THE photograph, in which the capstone is seen from below, shows the graceful form of the end-supporting stone, and the elaborate carving on the face of this. Other illustrations of the same dolmen will be found in the CENTURY PATH, vol. X, nos. 28 and 40.

The enormous size of the capstone testifies to the gigantic powers of the people who erected this and the innumerable similar monuments, unparalleled both in size and endurance by the work of any subsequent race, whether civilized or barbarian.

Ancient Egyptian Tools

AN article in *The English Mechanic* presents us with descriptions and illustrations of the tools used by the ancient Egyptians. Although the writer describes these tools as "of the rudest and flimsiest character," his statement detracts in no wise from the respect we must feel for the artificers; since, with these tools, if indeed they had no other, their magnificent work must have been executed. The power to execute consummate work with flimsy and simple tools argues a skill which would surely have been equal to the construction of more elaborate tools, had such been deemed necessary. But it may be questioned how far the writer is right in so describing the tools from such as have been handed down to us and from the pictures on the monuments; the actual tools, in our hand and in their original condition, might tell a different story. Howbeit, the workmanship is not called in question, however wrought.

A theory enunciated by the writer to account for such achievements with such poor tools as he alleges, strikes one as redounding still more to the credit of the Egyptians. "It is difficult to realize how the work was done, except on the assumption that large numbers of slaves were employed." One opines that it would raise the ire of a modern workman, if, when he complained that he was expected to do delicate cabinet work with a buck-saw, you sent him a dozen slaves to help him; nor would it seem likely to solve the difficulties of a sculptor, engaged upon elaborate carving of a block of granite, and armed with nothing but a sharpened iron bar, if you told off a detachment of convict laborers to assist him. True, pictures are found on the monuments, of large bodies of slaves dragging blocks of stones; but this is not quite the same thing. And, even in the matter of merely dynamical force, the slave-labor theory often fails, the difficulty being to explain how the force was

Lomaland Photo. and Engraving Dept.

INTERIOR OF THE TABLE DES MARCHANDS
LOCMARIAQUER, BRITTANY

applied. A teacher once told his pupil that if it takes one man twelve days to build a house, then twelve men can build it in one day. But Johnnie, who was wiser than most of his generation, replied that in that case, 288 men could build the house in an hour, 17,280 in a minute, and 1,036,800 men would rush it up in a single second of time; and he begged to be allowed to doubt it.

The tools were made of bronze — copper and tin; so that we must infer the Egyptians knew how to make bronze tools, as indeed other ancient nations seem to have known, but we do not know. The joinery was perfect, nails and other metallic fastening being mostly eschewed, and wooden pins and dovetails used. Nails are certainly a crude device, though they fit well the hastiness of our age.

One must beg to take definite issue with this writer and others of the same ilk on the question that the use of simple tools implies a low stage of knowledge and skill. The argument that the ability to execute consummate work with simple tools implies the ability to make better tools if needed, seems unanswerable; and, in the case of the modern Japanese, we have it confirmed by actual fact. The

nation that with the simplest tools can make those marvelous thin-wood inlaid cabinets, has now shown us that it can also make modern engines and machine tools when it has a mind to; and there is not the slightest doubt that the ancient Egyptian craftsmen could and would have done the same, if occasion had arisen.

The writer assigns the Great Pyramid to 2000 B.C., and the Great Sphinx to 1600. But the Sphinx is earlier than the Great Pyramid, as admitted by archaeologists; and the date of the beginning of the 4th dynasty is given as 4235 by Mariette and 3124 by Lepsius. And more recently archaeologists are pushing the date still farther back, largely owing to discoveries about Egyptian chronology and the use of the 1460-year cycle. By arguments drawn from the precessional cycle of 26,000 years and the Denderah zodiac, H. P. Blavatsky shows that the date may have been 78,000 years ago. STUDENT

Chaldea Older than Egypt?

THOUGH science may deny the great antiquity of man as taught by Theosophy, yet its own theories are bound to lead to an admission of this fact after all. Science is bitten by the craze to show that civilization has gradually evolved through successive rising stages from barbarism; and to prove this, science has to find those stages. Digging among the mounds, it finds that thousands of year ago there was high civilization; and this means that the age of barbarism has to be put very much farther back.

For instance, it is announced that a rare Chaldaean tablet has been acquired by the Walters Art Gallery, Baltimore, and that it is considered by an eminent Assyriologist to belong to the oldest hieroglyphic period and to prove that Chaldaean civilization may have preceded the earliest Egyptian. On it are pictographs, and it is maintained that the hieroglyphics of Egypt show a later stage in the development of writing. Several milleniums, it is added, must have elapsed before these pictographs developed into cuneiforms.

It is highly probable that the craze for evolution will land the theorists in some awkward plights. If these professors were to collect all the information accessible about writing and pictographs among all the nations, and then arrange a chronological history of the human race on the hypothesis that these different forms of writing succeeded each other in a particular order, then they would find their scheme of history clashing with those of other professors classifying humanity on other bases, such as language or physiognomy. E.

✻ The Trend of Twentieth Century Science ✻

The Steps of the Ascent

THE organic and inorganic worlds *seem* so far to be pursuing opposite directions. In one, the chief visible process is integration; in the other, disintegration. All the heavy and presumably complex inorganic atoms appear to be slipping downhill into lighter and presumably simpler ones.

That is doubtless because we have not yet come upon the trail of the other process, the coming up hill, the integration.

But in the organic world, in biology, it is the complexification, the integration, that predominantly calls our attention.

Just as, in the case of the atom, the addition to its thousand or more composing electrons, of another little group, would be a step towards its change of species into some other; so in the organic world a plant-seed's addition to its parentally inherited qualities, of one more "unit," would be a step towards a change of species—in the view of some biologists is a change of species.

The biological "unit," then, has a certain correspondence with the chemical electron. It is a slight change in the vital developmental processes of a seed, the addition of *one* to the number of vital developmental processes which the parent plant (say) underwent as it passed from seed to maturity. This addition does not constitute it a "variety" or variation, in the technical sense, but a new sub-species. The prefix *sub* is used to indicate the smallness of the change; but it is a true species in the sense that thereafter it is permanent, not reverting to the parental type, breeding true if permitted, and tending to be sterile when crossed with any other species. If this cross is fertile, the seeds of the offspring tend to be sterile.

The unit is some profound vital physiological change, however small, *showing* itself in some small external change, perhaps only a spot of color on a petal or wing. We can consider all that is going on in any animal or plant body at any given moment as one process. But we can also consider all the millions of minute doings and tendencies which make up that total doing. These, in one aspect of the new conception, are "units." The new sub-species has achieved the feat of adding one more, or a few more perhaps. This addition *may* result in a *wholly interior* and hidden modification of its life, quite imperceptible to us; or it may result in something that we can see. And this seen something may be as it were but an accidental and unimportant modification resulting from the really important inner change.

Chemistry deals with the (possibly) material electron, not as yet with that modification in the life-processes of an atom which is brought about by—or which brings about—the addition of the electron, or group of them. Setting aside the temporary change of electrical sign brought about by the addition or subtraction of one, two, three, or so, lightly attached ones, it so far knows only of those changes of property brought about by *enormous* additions or subtractions. Chlorine, for example, has 35 times as many electrons as hydrogen. The physiological unit is itself doubtless a complex.

Evolution, in the new interpretation, is the permanent acquirement of "units." If we say that the reptile has as it were a million of them, the bird has as it were a million and a quarter; and the sparrow born next year may have half a dozen more than the one of last year. Each unit, if the conception holds, must at root be a degree of consciousness; the vital or physiological change being a result from that, and the external change again from that.

Evolution, in the new interpretation, *does not occur by casual variation*. The casual variation differs from the definitely and permanently taken step forwards in that it is impermanent and presents nothing new. It is a temporary latency, or reappearance from latency, of something—as if some of the yellow in a green were to become temporarily latent. The resulting apparent increase of blue would be a variation. A true *step* would be a real reaching up of the green to get more blue, and this step would not be receded from. As Rolleston says:

The facts plainly point . . . to an aim at a desired object. Some of the arrows miss, some light near the mark, others hit it precisely. The flight, on the whole, is *in the right direction*. STUDENT

Rain Making

THAT plants are good conductors of electricity, and the points of their leaves and ends of their shoots good condensers of it, is a fact that has been used to throw light upon their growth. Professor Phin of Pennsylvania, writing on rain-making, remarks that

A spear of grass held at a short distance from the prime conductor of one of the old-fashioned electrical machines will cause its discharge very rapidly, and the billions of leaves and branches in a forest must tend powerfully to lower the electrical tension in the air which passes over it, and thus to promote the precipitation of the moisture.

In the passage of electricity through water the constituent gases, oxygen and hydrogen, are separated and liberated. Before the moment of actual decomposition there must be a moment of loosening. In the passage of electricity through carbonic acid gas, either in solution in water or free in the air, there must also be a loosening of cohesion among the three atoms—one of carbon and two of oxygen—within the molecule.

It is doubtless during the moment of this loosening that the plant does its work, liberating the oxygen and seizing the carbon for association with the water elements of the sap. The bulk of plant tissue is composed of carbon in combination with the elements of water.

Vegetation is one of nature's chief agents for the neutralization of the opposite electricities of air and earth. We can thus understand why forests provoke rainfall.

That even in the driest time there is always a very considerable percentage of moisture in the atmosphere is well known to everyone who has watched the dew settling on an ice-pitcher on a dry summer day.

But it will not necessarily appear as rain even if the temperature falls and the percentage is large. Another factor is needed.

A saturated solution of certain salts may be cooled far below the crystallizing point, and yet the salt may not solidify; but the introduction of a small crystal or a little dust may convert the liquid almost instantaneously into a solid mass. And in the same way a bell-jar filled with moist air, quite free from dust, may be cooled far below the point of saturation, and yet remain quite clear; but let a little dust be introduced, and a cloud instantly forms.

"Dust," then, is needed for the raindrops to form on; but it may be dust of a character to which we should hardly give the name. A free electrified atom, an "ion," is a speck of dust from this point of view, and even a single one of the thousands of corpuscles which an atom may contain. It is probable that the vital processes of trees and other plants involve the continuous liberation of ions and corpuscles, thus providing the nuclei upon which raindrops may form, and leading to rain.

Part of this liberation doubtless occurs during the mysterious process of the breaking up of the carbonic acid molecule. Part may occur when they seize the free nitrogen molecule despite its inertness. For it has of late been shown that plants do that.

Professor Phin suggests that when we want rain we should provide the dust. The ordinary cannon discharge sometimes used in France does not carry its dust nearly far enough, and dynamite, which yields no dust at all, must be useless. His proposal is

to send up captive balloons carrying as large a quantity as possible of very fine and light dust or powder, this powder being contained in nearly globular packages, each having a powerful explosive in the center, so that at the proper height, which may be determined by experiment, the dust may be scattered over as wide an area as possible.

STUDENT

The Sun as Magnet

RECENT spectroscopic examination of the sun has detected him in the very act of being a magnet, possibly a set of them, corresponding with various diameters whose poles are sun-spots coming to the surface within forty degrees of the equator.

The spots present themselves to the spectroscopist as vortices whirling up from the deep. Assuming that the gyrating stream consists of electrified particles of some order, it would follow that the axis of the whirl is a magnet or rather one pole of a magnet. The other pole may be at the opposite end of that diameter. The polarity of a magnet is a case of electricity, currents gyrating round each pole; in the one case to the left, in the other, to the right. Two of the sun-spots spectroscopically studied and photographed at Mount Wilson showed opposite rotations of the streams, opposite poles of two possibly diametrical magnets being thus apparently presented. But whether the magnet, pre-existing, caused the spiral rotation of the particles, or the particles, gyrating, created the magnet, science does not know. If the latter view is taken, the vortex, which begins at the bottom of the spot and ceases to be observable far out in the solar atmosphere, remains to be explained. We can understand a vast discharge from the depth, but not why it should be found rotating from its first visibility. STUDENT

Nature

Studies

The British Museum

FOUNDED in 1753, when the collection of Sir Hans Sloane and the Harleian collection of manuscripts were acquired and an act of parliament passed for "providing one general repository for the better reception and more convenient use of the said collections and of the Cottonian library and of the additions thereto." The manuscript collection of Sir Robert Cotton, presented to the nation by Sir John Cotton in 1700 was, however, virtually the beginning of the Museum. The above collections, designated "The British Museum," were deposited in Montague House, Bloomsbury, in 1754, and opened to the public in 1759. In 1816 temporary additions were made to the building to accommodate the Elgin marbles, and by 1845 the four sides of the present museum were erected and Montague House removed.

Further additions afterwards became necessary, and in 1857 the reading-room with its book galleries was built. From 1880-3 the natural history collections were transferred to the South Kensington Museum. In 1895 houses and grounds on the east, north, and west were purchased for future extensions, the whole making a square plot of 13 acres. The reading and library department has quite recently been enlarged.

The MSS. department contains (1907) upwards of 55,000 volumes, besides Greek, Coptic, and Latin papyri, charters and seals. The printed book department contains about 2,000,000 volumes and receives a copy of every book published in the United Kingdom; the annual increase amounts to 46,000 volumes, exclusive of continuations, music, newspapers, etc. Space forbids mention of the innumerable other contents of this priceless repository. In 1905 the number of visitors (exclusive of readers) during the year was 813,659.

Mammoth Cave

AN account of explorations in the Mammoth Cave, by a German named Kaemper, appears in the *Scientific American*. This man visited the cave on a trip in 1908 and became so interested that he stayed there and surveyed it. He discovered many new parts and made a map but the management withholds this from publication.

The exploration of the cave is now more difficult than before; for, contrary to false reports which stated that the drought had

caused a subsidence of the waters, the waters have actually increased, flooding several passages once navigable, owing to government dams on the Green River. The visitor usually sees only about a tenth part of what is on the plan. The new survey covers 50 miles more than the 100 previously mapped; there are now known and located 69 pits and 39 domes, or in all 120 vertical shafts. Mammoth Cave is really a congeries of hundreds of caves joined into one vast cavern by the breaking down of walls and floors through at least five distinct tiers.

The wonderful region named the "Violet City" is an immense expanse 250 feet in length and 125 in width with an estimated height of 100 feet. The central portion is a massive formation named "Blair Castle," the environs of which are styled "Walhalla." Stalactites and stalagmites abound, varying in color from the purest white alabaster through every imaginable shade. The upper central part of the hill is crowned by three masses of fluted white onyx, glistening with exquisite crystals. A row of stalactites of varying length emit musical notes when struck and tunes can be played on them. And there are many other imitative wonders of surpassing beauty.

Curious Markings in Trees and Stones

A WRITER to the London *Spectator* says that during alterations at a public building in a Scottish town the workmen had occasion to cut down a plane tree. On sawing it up into short lengths they no-

ticed that it was curiously marked towards the center, and on further splitting it longitudinally they found it was strongly marked from the bark inwards to the center, as with a hot iron, with the initials and date A. H. 1895. An examination of the bark showed the same characters, almost obliterated. The tree was planted about 40 years ago, and the initials were cut 14 years ago. The cutting seems to have affected the wood in such a way that the subsequent growths followed the original markings.

Though this case can be explained as above, there are often cases quoted which are not susceptible of such an explanation. The above letter was written apropos of an account of some wonderful markings on an ostrich egg. Often curious forms are found in stones, especially flints. In accordance with the facts of Nature recognized by Theosophy, it is easy to understand how such imitative designs could be impressed on growing material, whether animal, mineral, or vegetable. For all the designs and patterns on which living matter (including mineral) is formed exist previously in that ultra-physical "space" known as the "astral light." Since this astral light is full of pictures and forms, either of natural objects or of people's thoughts, it is not surprising that sometimes such forms should become impressed on the growing substance. The real difficulty is to explain why this should happen so infrequently and what are the conditions for its happening. The subject would afford an interesting opportunity for scientific investigation. STUDENT

THE BETTER TIME COMING

'TIS coming up the steep of time,
And this old world is growing brighter;
We may not see its dawn sublime,
Yet high hopes make the heart throb lighter.
We may be sleeping in the ground
When it awakes the world in wonder;
But we have felt it gathering round—
And heard its voice of living thunder,
'Tis coming! yes, 'tis coming!

'Tis coming now, the glorious time
Foretold by seers and sung in story,
For which (when thinking was a crime)
Souls leapt to heaven from scaffold's glory.
They passed, nor saw the work they wrought,
Nor the crowned hopes of centuries blossom;
But the living lightning of their thought
And daring deeds, doth pulse earth's bosom.
'Tis coming! yes, 'tis coming!

Gerald Massey

The Problems of Life and How to Meet Them

(Read before the Young Men's Club, International Headquarters, Point Loma)

FROM one point of view the problems of life may be said to be the same in all ages, to be met in the same way. It will prove useful to look at the question from this broad standpoint in the beginning, as we can then at once get at the root and cause of the conditions which human life presents. We shall thus not be so easily bewildered by the various aspects these problems have taken in our own age, when we are brought face to face with them.

The greatest problems of life are to be found and met within ourselves, not outside ourselves. Their cause lies in human nature, in its duality. The animal man has already reached his perfection as such in his evolution, and has now to enter upon another and higher phase by becoming an instrument of the real man, the soul, who for long ages has been trying to take up its work in the world more consciously.

In the animal kingdom selfishness is still ruling, and this holds true even more markedly concerning the animal man. But as the soul gains ground and the characteristics of its life come to the front, a new keynote is struck, the keynote of brotherhood. The era of selfishness should be past in every man worthy of the name; the era of brotherhood should be here, allowing the forces of the soul to flow out in life in a constant stream, a blessing to all that lives. However, we have not reached this point as yet. Most men still continue their lives in the old course, and the soul has not been able to incarnate in a very high degree in general; and so the struggle goes on and the problems of life take on new aspects in every age. But evolution can not be held back very long; the struggle is being fought out in individual lives, and each successful fighter becomes a light to the world,

spreading helpful influences both far and wide.

There have been times when the soul seems to have come forth in a higher degree than now, in the Golden Age when gods lived among men. As far as history goes we have evidently been on a path leading down into a dark and gloomy valley, where the rays of the sun have been very scarce. Yet, perhaps we have had to step down into the darkness to gain some needed experience and bring with us something up to the hilltop, into the sunshine. And now, as Katherine Tingley has said, "the mountain heights are again seen, suffused with the glow of dawn and the promise of a new Golden Age, and a pathway is once more shown to that realm where the gods still abide." At such a point much depends upon the few who stand around the Leader of the forces of Light, and who have openly recognized her as Leader. She continues: "It is yours to climb that pathway, to awake again in your hearts the memory of the childhood of the world and proclaim the new Golden Age of Universal Brotherhood which awaits the human race."

Turning to our own age we find men's eyes turned downwards and outwards to the exterior of things. Religion in its various forms has lost its hold on men's minds; science is building its outward structure without caring that all these wonderful instruments which it is examining are for the use of the living soul; and materialism is spreading all over the globe. It would seem that this course had now almost reached its climax for there is a halt; exhaustion and doubt are more prevalent, and each day the craving for an answer grows stronger. What is the meaning of it all?

Instead of leading the forces of evolution in the right channels, men are trying to back them up by artificial means. Just like a man who is trying to stop a river by building a dam; when the water rises it will find some way to come through, and a higher dam is then required; in a little time the river finds another escape, necessitating new structures and stronger ones. But at last the mass of water now gathered will break the whole dam and take its course, destroying everything in its way. How much wiser then to lead the river from the very first in the course that will be most useful and allow it to flow quietly and to be a blessing on its way.

The former way we see out in life. Passions and desires are backed up, but in time they find means to escape in new sicknesses, new kinds of insanity, new crimes, so that new institutions, new laws are constantly required, and there is no end to them.

The other course is adopted by the Leader of the Theosophical Movement in the Râja Yoga schools. Here all the forces of human nature are directed in the proper course, and thus there need not be any sudden explosions or break-downs, the life runs quietly on in a steady and useful stream of work, a blessing to all. On the hill of Lomaland we know that the answer that the world needs is ready and that it is ringing out into the life of the world stronger and stronger every day. We know that it, of course, is rejected by the old currents of life, but that we have the souls of men on our side, and the whole force of evolution.

When speaking with people along this line we often find how difficult it is for them to

feel sure that the simple doing of one's duty is the very thing to do, the best way of meeting the problems of life. They are constantly looking on the past or on the future, and thus the "Now," the moment for right action, is seldom found. In the Râja Yoga life the "now" becomes the principal thing, including both the past and the future. Theosophists know that the fruit of action lies in the action itself, the action is the only thing within our reach.

In concluding we may say that the greatest problems of life arise from selfishness, and from the fact that the greater part of mankind is not aware of the real situation, viz.—that we have left the mere animal evolution and entered upon the human, where selfishness is out of order. The problems of life are to be met by brotherhood, the true characteristic of the human soul, and this is realized in life by attending to duty, allowing the Warrior within to take up his proper work in the atmosphere thus created.

P. F.

A Problem of Life Today

ONE of the serious problems of the present generation is how to be rid of our intellectual veneer. We live but upon the margin of our brain, so that there is no opportunity for the heart to express itself. Thus, in the generality, our philosophies are formulas; our science classification. Our minds are ever reaching forward to grasp something material, in place of following simply the path of duty inward to the realm of the soul. We are like the tree that would continually shoot branches sideways, shutting the light and air from other trees; the healthy tree throws its head straight up into the heavens.

The lost talisman is intuition; attendant upon it are the qualities: integrity, thrift, and endurance. There are still left in remote country districts people who will receive under their roof each and every wayfarer, with perfect hospitality. They are friends of all the world. We find people of the same spirit, in those times of history when a whole nation is fired with a pure energy to lift the race over a certain point of evolution. Such were they who drove back the Spanish Armada, men of integrity, thrift, and endurance. We must emulate the vigor of those pioneers to this land of America, who forged their way through the rough forests, finally to stand united, men inspired, to draft the Constitution. Katherine Tingley has said, "The knowledge that we are divine gives the power to overcome all obstacles."

Theosophy alone, in the present state of the human mind, will solve the problem of man's nature and enable him to realize, first intellectually, later in deed and action, the fact of the duality of his nature, one pole partaking of the animal, one of the godlike.

A YOUNG STUDENT

AND this is really the keynote—the recognition of the soul in men, whether they be black or white, despairing or hopeful. It is in all men even though our civilization, our desires, our reason may seem to choke it: even though science in its blindness may not see it—yet it stands majestic, the core and heart of each man's life—the dictator of his being, the director of his destiny.—Katherine Tingley

NOW

IF you have work to do,
Do it now.
Today the skies are clear and blue,
Tomorrow clouds may come in view,
Yesterday is not for you;
Do it now.

If you have a song to sing,
Sing it now.
Let the notes of gladness ring
Clear as song of bird in spring,
Let every day some music bring;
Sing it now.

If you have kind words to say,
Say them now.
Tomorrow may not come your way,
Do a kindness while you may,
Loved ones will not always stay;
Say them now.

If you have a smile to show,
Show it now.
Let the friends around you know,
Make hearts happy, roses grow,
The love you have before they go;
Show it now.

Chas. R. Skinner in *Sentinel*

THEOSOPHICAL FORUM

Conducted by J. H. Fussell

Question How is Theosophy to be made practical?

Answer Between saying and doing a great gulf is fixed; one can never, in words, transmute words into action; the two things are not of one nature. So one could never answer a question such as this, except for oneself. If the horse could be led to the pond, and *then* made to drink, the world would have shaken off its vices long ago.

Read what H. P. Blavatsky wrote, and William Q. Judge's devotional works, and Katherine Tingley's; one would say that they have made the path as plain as it can be made, and spoken the last word that can be heard in this present age. There is a pond there for all horses, if they would drink; but this is an art incommunicable; one must do something for oneself.

Theosophy presents the teachings, and the injunction to make them practical; and shows the awful need for doing so. But no man can take hold of one's being and remold it; in that sense the only teacher is the Law. One must be aware of a will within him towards the higher life; it is by the use of that will that success comes. Yet the first faint aspiration is no doubt the earnest of final victory, and the only failure is to be discouraged.

Theosophy knows well enough what wonderful power and persistence there is in the lower self; but still proclaims the superiority of the soul. Here is an idea in which the mind must be soaked; seize it, brood over it, return again and again to it; make it instinctive, habitual. Original sin is a small thing; original virtue very great. This personality with its desires and base tendencies, its waste and uselessness, is really only the lesser part of ourselves. We are held fast in the grasp of it, true enough; but have not gone far into our being. Beyond and behind it is a whole new kingdom, whose monarch is of divine race, and invincible. This is the soul.

Now there is no going into the soul's realm without one key or password: selflessness. "To live to benefit mankind is the first step," says the Teacher; that is the priceless and initial attainment. Many will go out to win some virtue, and strive mightily towards it; and fail and fail and always have the same battle to fight; the virtue they desire is to be a new jewel for their own crowns, and the universal purpose has no concern with that. The virtues of a selfish man are of no use; rather they are a hindrance than a help.

Now these personalities we dwell in have a long heredity behind them, spiritual and physical, of selfishness. For ages we have lost sight of this idea of living to benefit mankind; and so have walked carelessly through life, suffering immense casualties in all dangerous places. The last word of our selfishness is heard in religious endeavor; we are to do right in order to save our souls. Such right is only a kind of wrong, and impedes the march of things.

When a man takes the grand step of determining to live the higher life, he finds himself in a new and unfamiliar world. He has been living at the mouth of a cave; behind him the mountain is entirely hollow. He has to go in there and discover wonders; within are all the forces that are to uplift or ruin his life. Out of the darkness a whole horde is risen up against him; desires that smoldered before leap into flame, and he is surrounded on all sides and perpetually attacked. Discouragement and despair beleaguer the gates of his mind, waiting for the least permission to enter; and where life was easy enough before, it is now the steepest and hardest thing in the world.

All that dark cavern of self has to be explored and light brought into it, or we can get no weapons nor allies for our conflict. As a rule we hardly know what imagination means; yet with no power are we more vitally concerned. It is not a thing to be left to poets and yellow journalists, but a tool for our daily use, indispensable. One must work always with it, building divinity within oneself.

Our language is loaded down with proverbs of discouragement; it has become a second nature to us to descant on the feebleness of human effort, the poor thing it is to be human. We have to undo all this with imagination. There is a god in each of us, and we have to imagine that god into daily and hourly activity. All the time, really, this power is in action; but it is leaking and going to waste. Fear and rancor and desire are all a matter of the imagination. Many a man wastes whole Niagaras of potential force, considering the unpleasant contingencies he may fall into, etc. But the doctrine of Karma disposes of all this; it shows our fate to be in our own hands, and offers trust as a substitute for fear. Now fear, like all other evils, attacks intermittently; could we not begin by giving the intervals to its opposite? To imagining ourselves as protected and invincible, in that we are souls, and under the Higher Law? Carve the figure of it in your mind, and go on until it is complete and perfect; and then brood on and love it, Pygmalion-wise, until, like Galatea, it comes down from its pedestal and is alive.

It is very little use waiting to fight our temptations until they are thundering at the

gates of the mind. Make warriors to oppose them before the attack is offered; let your imagination be at its drill and dumb-bells in whatever time is at your disposal, constructing your own higher life. So the Teachers of Theosophy have urged us to do, advising that a time be set apart each day for this practice. Every night before sleeping, they say, we should reaffirm our aspirations; above all, our desire to do selfless service in the world.

One may say, "But I cannot find within myself any desire to benefit mankind; I have no such desire, but only wish that I had." Theosophy comes to our rescue here. The soul within has that desire always; so that by a certain faith we can still bring it down into our consciousness, and take the first step. We *must* acquire it sometime; through suffering if by no other means; but not necessarily through suffering. Again, it is a matter of awakening the imagination and letting it play upon the teachings of Theosophy.

Then imagination has to be brought to bear on all the duties and actions of the day. Usually we do things for the sake of what we can get by doing them, and reap no good spiritual harvest. But we *could* do them as "an intent and loving service to the Divine Self of the world." Work so done brings a current down through us from the divinity within, which alters, elevates, and tones the substance of our being. There is a power within ourselves which is invincible, perfect, all-compassionate; and what we have to do is to bring that power into being in our conscious selves, through imagination and effort, effort and imagination. **STUDENT**

INQUIRER. But suppose a member of your Society should plead inability to practise altruism to other people on the ground that "charity begins at home"; urging that he is too busy, or too poor, to benefit mankind or even any of its units; what are your rules in such a case?

THEOSOPHIST. No man, on any pretext whatever, has a right to say that he can do nothing for others. "By doing the proper duty in the proper place, a man may make the world his debtor," says an English writer. A cup of cold water given in time to a thirsty wayfarer is a nobler duty, and of more worth, than a dozen dinners given away, out of season, to men who can afford to pay for them. No man who has not got it in him will ever become a *Theosophist*; but he may remain a member of our society all the same. We have no rules by which we can force any man to become a practical Theosophist if he does not desire to be one.

INQ. Then why does he enter the Society at all?

THEO. That is best known to him who does so. For, here again, we have no right to prejudge a person, not even if the voice of a whole community should be against him, and I may tell you why. In our day *vox populi*—so far as regards the voice of the educated, at any rate—is no longer *vox dei*, but ever that of prejudice, of selfish motives, and often simply of unpopularity. Our duty is to sow seeds broadcast for the future, and see they are good; not to stop to inquire *why* we should do so, and how and wherefore we are obliged to lose our time, since those who will reap the harvest in days to come will never be ourselves.

—H. P. Blavatsky, in *The Key to Theosophy*

THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY

FOUNDED AT NEW YORK CITY IN 1875 BY H. P. BLAVATSKY, WILLIAM Q. JUDGE AND OTHERS
REORGANIZED IN 1898 BY KATHERINE TINGLEY

C e n t r a l O f f i c e P o i n t L o m a C a l i f o r n i a

The Headquarters of the Society at Point Loma with the buildings and grounds, are no "Community" "Settlement" or "Colony." They form no experiment in Socialism, Communism, or anything of similar nature, but are the Central Executive Office of an international organization where the business of the same is carried on, and where the teachings of Theosophy are being demonstrated. Midway 'twixt East and West, where the rising Sun of Progress and Enlightenment shall one day stand at full meridian, the Headquarters of the Society unite the philosophic Orient with the practical West

The Ancients and Compassion

A NEWSPAPER may figure as a kind of personality with a definite brand of opinion, but to a large extent it is a medley and presents opinions contradictory to each other. The London *Spectator* has been quoted in these columns as having printed a discourse in which Jesus was represented as having been the first to introduce compassion to the world, and the article was unsigned. And now we have another unsigned article, in the shape of a book review, in which that opinion is modified. In a book on *The Place of Animals in Human Thought*, by the Countess Martinengo Cesaresco, much information on this subject has been collected. The reviewer, however, as will be seen from certain expressions he uses, as well as from his title, "The Lesser Affections," feels bound to adhere as far as possible to the theory that compassion is a peculiarly Christian virtue.

"The Stoics," says Plutarch, "made sensibility towards animals a preparation to humanity and compassion because the gradually formed habit of the lesser affections is capable of leading men very far." Marcus Aurelius in the same spirit coldly exhorts to kindness. "As to animals which have no reason . . . do thou, since thou hast reason, and they have none, make use of them with a generous and liberal spirit." No doubt the aim of the Stoics in cultivating compassion was the right aim. But the Stoics were terrible prigs. Perhaps that is why they never succeeded in persuading their adherents to abolish the arena. Mercy, to have any dynamic force, must be of the nature of a passion. St. Bernard said that if mercy were a sin, he would still commit it. His words and those quoted above them throw a bright sidelight on the essential difference and superficial likeness of the Christianity of Christ and the Stoicism of Marcus Aurelius. Christianity is a venture and Stoicism a scheme. They illustrate the everlasting difference between a faith and a theory.

The attribution of coldness and doubtful sincerity to the Stoics is merely a forensic argument which could as easily be turned the other way, and really amounts to a begging of the question. It would, for instance, be quite easy to say that whereas our compassion is hot-headed and often injudicious, that of the ancients was calm and wise.

Sympathy for animals is, however, as the book before us amply proves, no product of modern civilization. Men have often forgotten their relationship to the beasts of the field, but it was suspected and acknowledged very early. Scandinavian and Persian and Indian literature furnish illustrations of curiously modern feeling in this respect. The *Rig-Veda*

MEMBERSHIP

in the Universal Brotherhood and Theosophical Society may be either "at large" or in a local Branch. Adhesion to the principle of Universal Brotherhood is the only prerequisite to membership. The Organization represents no particular creed; it is entirely unsectarian, and includes professors of all faiths, only exacting from each member that large toleration of the beliefs of others which he desires them to exhibit towards his own.

Applications for membership in a Branch should be addressed to the local Director; for membership "at large" to G. de Purucker, Membership Secretary, International Theosophical Headquarters, Point Loma, California.

preserves this address to a home-coming bride:—"Make thyself loved for the sake of the children that will come to thee; guard this house, be as one with thy husband; may you grow old together. Cast no evil looks, hate not thy spouse; be gentle in thought and deed even to the animals of this home." Zoroaster taught that men had duties towards the brute creation to be performed as to "God the giver, Forgiver, rich in Love." Their souls, he thought, would live again at "the renewal of the world." Zoroaster could hardly limit mercy: he believed that "the voice of him weeping, however low, mounts up to the star-lights." Moses legislated for animals, though to the Jew the gulf between the human and the brute creation was always wide and evident. The Korân yields some sentences suggestive of sympathy, for instance the following:—"Fear God in these dumb animals, and ride them when they are fit to be rode, and get off them when they are tired." Again:—"There is no beast on earth nor bird which flieth with its wings but the same is a people like unto you, we have not omitted anything in the Book of our decrees; then unto their Lord shall they return."

This all shows a wish to soften the statement about Christianity and compassion, and may be regarded as a virtual abandonment of the position. Such a position is of course untenable in view of historical facts. Nor is it at all necessary to buttress up Christianity by such means; that which is evil in Christianity should not be buttressed up, and that which is good need not fear historical facts. If, in order to vindicate the moderns, it be deemed necessary to disparage the ancients, the argument is surely not favorable to the moderns. The attempt to treat compassion to animals as a "lesser emotion" is not very successful, especially in view of the quoted statement of Zoroaster. Still less is it so in view of the argument that is sometimes met, that kindness to animals is a peculiarly modern and Christian virtue; an argument which of course cancels the other.

The fact is, that wherever and whenever the higher nature and higher responsibilities of man have been recognized, there and then the power and duty of compassion have been recognized; compassion towards all that has life.

But before we can treat the opinions of

scholars with more respect we must have some proof that they are acquainted with their subject; whereas we find that not only have some of them altered the date of certain very ancient scriptures, so as to suit the purposes of ecclesiastical Christianity, but that others are positively not even aware of the existence of such scriptures—as

shown by their inability to spell their names! For the following interesting letter appears (unanswered) in the same number of the *Spectator*:

SIR,—Is it not strange that in your quotation in your last issue of Mrs. Steel's letter from the *Times* you follow the *Times* in printing "Rurana" instead of "Purana"? Is it worth while to point out that the passage is translated in M. Williams's "Indian Wisdom," published in 1876, p. 500, who tells us on p. 493 that "the oldest" Purana "we possess can scarcely date from a period more remote than the sixth or seventh century of our era."—I am, Sir, &c.,

So it appears that, even if the *Times* made a misprint, the *Spectator* was not aware that it was a misprint. The date of the Purânas has been made thus recent in order to avoid the very serious difficulty of admitting that the Biblical teachings were antedated by the ancient Hindû wisdom.

The reviewer adds a few words about the fact, that animals suffer, being a source of scepticism; the idea being that a God would not permit this. This is the attitude of a man who undervalues man's own position as the chief vicegerent of Formative Power (on earth), and who wishes to shift his responsibility upon the shoulders of an Almighty. The free will of man, perversely used, has introduced disharmony into life on earth, and the same power is capable of restoring it. There can be no doubt that the sufferings of animals are adjusted by an equitable Law of recompense; but this does not excuse those who inflict the suffering. Suffering inflicted consciously by an intelligent man is a great wrong; as to the sufferings brought about naturally, we can scarcely adjudicate in such cases; suffering is one of Nature's greatest teachers.

THE THEOSOPHICAL ADDRESS AT ISIS THEATER

INDEPENDENCE DAY falling on a Sunday this year gave the Râja Yoga pupils from the Academy at Point Loma an excellent opportunity of expressing the high ideals of patriotism which are taught under the auspices of Katherine Tingley and the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY. Last night's meeting at the Isis Theater was conducted entirely by the senior boys of the Râja Yoga Academy, and in addition to the addresses a fine musical program was rendered by the young artists who are being trained in the Isis Conservatory of Music at Point Loma. Selections were played by the Râja Yoga Quintet, and a brilliantly executed violin solo, *Romance*, op. 42, by Max Brusch, was given by one of the older pupils. The following are a few extracts from the addresses on Patriotism:

"The root of all life's problems lies in *Human Nature*; and national problems all have their origin in the individual; so that it is the duty of every true patriot to solve the problems of his own nature in order that his energies may then be of service in lifting the nation. When each one has done his duty by himself to the highest of his ability and understanding, he may then turn to the problems of the state and nation; to his surprise, he will find that the most formidable have disappeared and the solution of those remaining have become infinitely simplified.

"The Râja Yoga idea of Patriotism does not confine itself to a single nation or people, but goes out to the whole family of nations, to humanity. A Râja Yoga student loves his country with the warm love of the most sincere patriotism, but the very warmth and sincerity of his love makes it impossible for him to ignore the existence of brothers of another nationality. . . . In working for our own nation at the expense of others we are breaking the unity of the race and causing a weak link in the vast chain of international relationship, for which we must suffer. So that Thomas Paine was really voicing the highest sentiment of the patriot when he said, 'The world is my country, to do good my religion.'

"Patriotism is too often thought to be concerned with the battlefield exclusively. Well, so it is, if we admit of battlefields other than the physical. . . . What is needed is the self-denying patriotism which will do right alone and unaided and unwatched as cheerfully as if urged on and applauded by admiring thousands. We all know the intoxication there is in success before the eyes of the multitude. There a man is carried away and braves all, even death, in the performance of that which wins the approval of the crowd. But those who have the courage to do right because of the prompting of the higher nature, in order first of all to win their own self-respect, are the true patriots."—San Diego Union

Astronomical Notes:

What is Taking Place on Jupiter?

THE planet Jupiter has been very conspicuous in the evening skies lately, but its brilliancy will soon be overpowered by the increasing luster of Venus, which though one of the smallest of the planets, is the brightest—as seen from the earth.

For thirty years an enormous spot has been

visible on the surface of Jupiter, the only permanent feature amid what appear to be ever-changing cloud-surfaces. It is known as the great Red Spot, because when first seen, and for many years after, it was of a deep ruddy color. For long it was easily seen in the smallest telescope; now, however, it has faded and is scarcely to be distinguished from the general surface brightness, but its situation is clearly marked by a deep curve in one of the equatorial belts which cross the planet. The spot is oval and fits into the space formed by this bend.

Jupiter has offered many perplexing problems ever since Galileo's telescope revealed to the modern world the general aspect of the planet, with its strongly oval shape (caused, it is supposed, by its rapid rotation in about nine hours and fifty minutes), its delicately colored belts, and its four conspicuous moons. We now know that Jupiter has eight moons at least—four being extremely minute—and that one of the smallest travels round the primary in the reverse direction from all the

been seen by competent observers. This is called the "square-shouldered" aspect. The planet looks as if the top and sides had been slightly squeezed or flattened, and that this is not due to our atmosphere can be shown satisfactorily. The same phenomenon has been noticed in the outline of Saturn, which is also a planet of very low density. Assuming that both Jupiter and Saturn are covered by an immensely deep layer of clouds or other vapors, such a change of shape is not altogether inconceivable, although we cannot imagine the cause, but how then could an island be seen floating on the surface in the manner that is suggested by the behavior of the great Red Spot? C. J. R.

'Science' Teaching in Schools

FADDINESS and superficiality in education are sometimes carried to great lengths, but there is a wave of protest against them. A newspaper quotes the following conversation between a school child and its mother:

Lomalind Photo. and Engraving Dept.

TWO ASPECTS OF THE PLANET JUPITER, ONE SHOWING THE GREAT "RED SPOT" AS IT LOOKED IN 1903

others. This abnormal feature is quite unexplained as yet, but it is not a bit more puzzling than the curious behavior of the great Red Spot. While the belts and other spots are continually changing shape and position, appearing or disappearing, the Red Spot seems to have come to stay. The general current of drift of the surrounding surface is from east to west, but the Red Spot appears to offer some resistance to the current, for it moves along much more slowly and even seems to oscillate irregularly in its career. Some of the currents can be seen to pass above and below it, and, strange to say, some pass *underneath* it. It resembles nothing so much as a floating island. Flammarion very plausibly suggests that it is possibly the first condensation of a future Jovian continental crust floating upon a heated and liquid surface. If this be so we are in the remarkable position of being able to study the initial stages of the solidification of a world. But there are serious difficulties in admitting this explanation; the density of Jupiter is so low that the solid matter, if any, must be thousands of miles below the apparent surface.

Another mystery connected with Jupiter is the occasional distortion of outline that has

CHILD (To mother, proudly): We have studied the potato and the dandelion.

MOTHER: What did you learn about the dandelion?

CHILD: It's a tuber—Oh, no, that's the potato.

MOTHER: Well, what did you learn about the potato?

CHILD: A potato is a tuber.

MOTHER: Well, what is a tuber?

CHILD: Oh, it's a sort of a tube or hole.

MOTHER: Did you ever see a potato with a tube in it?

CHILD: Yes, lots of times.

MOTHER: Well, and what did you learn about the dandelion?

CHILD: A dandelion is a biennial.

MOTHER: But what is a biennial?

CHILD: Oh, it's a thing with scales.

MOTHER: Did you learn anything else about the dandelion?

CHILD: Yes, it has a hundred, or a thousand, or a million little, little flowers.

This, continues the writer, is a fair sample of the kind of nature-study lesson given by the average teacher, who knows as little about the potato and the dandelion as she does about the forty other subjects assigned her under the head of "General Lessons." A perusal of the "Course of Study" will show the parent why the schools do not teach the great body of pupils to read, write, spell, and reckon. It calls for a knowledge, on the part of the teachers, of botany, ornithology, zoology, entomology, geology, and ichthyology; and to

ask teachers to instruct in a subject of which they are manifestly ignorant is described as a betrayal of public trust. For the teacher cannot be an expert in a dozen different branches of science.

But it is wrong to blame the teachers, adds the writer; in which one must heartily agree with him. They cannot help themselves, and it is a real shame to add the weight of blame to the already too heavy burden on their shoulders. Here is the work assigned to the third grade:

1. Plants: gentian, dandelion, clover, burdock, cabbage, potato, turnip, beet, onion, tomato. Whole plants, including root. (Gentian excepted.)
2. Fruit: lilac, linden, maple, rose-hip, fleshy fruits, dry fruits, dry fruits of the world.
3. Animals: (Watch metamorphosis of cabbage worm.)
4. Daily phenomena of winter.
5. Study of twigs of maple and poplar, with their winter buds and leaf scars.
6. Germination: bean, pea, morning glory, corn, pumpkin, and maple seeds for comparisons.
7. Development of bud: oak and maple. Flowers to be studied: anemone, columbine, hyacinth.
8. Birds: woodpecker and meadow lark.
9. Water animals; snail, fish, frog.

All this the writer characterizes as useless and harmful fooling in the interests of vanity and display; while in the meantime the children grow up in ignorance of the correct use of their own language. He appeals to parents to be less indifferent about their children and to insist that they are properly taught.

Experiences like this tend to show that when we propose to cast off old prejudices and strike out on new lines, it is not wise to be too radical. For the old-fashioned ways contain much that is worth keeping. It requires wisdom to know how to avail oneself of what is valuable in them while rejecting the useless; and, failing this wisdom, one has to learn by experience. The result of such experience is that there is a return to some old-time ideas that had been scornfully rejected.

It is evident that there is another side to the question between *classical* and "modern" instruction. What argument on the score of uselessness can possibly be urged against Latin and Greek that does not apply with greater force to the schedule above quoted? Is it for this that we are to throw away the studies of ages?

The cry for "utility" in education does not seem to amount to much, if we are to judge by the comparative effects of the old style and the new. Latin and Greek have been despised, because they are, as it is alleged, not utile; and in their place have been put all these -ologies. Are the latter, then, so utile after all? Our ancestors evidently had a purpose in insisting so strongly on Latin and Greek, and we are beginning to realize what it was. They must have felt that the essentials of education are a disciplining of the faculties, without which nothing can be acquired, but with which anything can be acquired. It would be of no use trying to teach a recruit all sorts of complicated maneuvers, or a prospective athlete all kinds of elaborate gymnastics, unless they first had a sound constitution and a well-developed muscular system. But, given these, it would be easy to teach them anything.

The old-fashioned education did attend to the solid requirements and develop the mental faculties. It had its abuses and excesses, but we should have retained its advantages. It

may be that certain studies are valuable precisely *because* they have no direct practical utility. It may be that *because* Latin and Greek are not spoken, therefore they should be studied. Subjects that are not "utile" may form an essential feature in a complete education, simply for the reason that they are not "utile." Latin and Greek may be overdone, as in some English schools; but, when not thus overdone, they form a most valuable training for the mind. Particularly in the faculty of grasping the relation between words and ideas do they help. Their study affords a means of studying language in the abstract—language apart from any particular language. The pupil thus acquires a mastery of the laws of thought and expression which renders him at home in the mysteries of his own language or any spoken language. In addition, he acquires the arts of mental concentration, methodical thinking, variety of expression, richness of ideas, and many other faculties that are not only useful but essential in the acquisition of anything.

If scientific and technical education are useful, they can be made much more so by being preceded by a general training of the faculties such as is given by a thorough course of the rudiments and a certain amount of Latin and Greek. Many have realized that the mind which has been too exclusively trained in the sciences betrays a certain barrenness and want of flexibility; and many, thus brought up, have tried in vain to remedy their defect in later life. But the classically educated person, if he has a bent toward science, finds no difficulty in developing it, and all his past training assists him and makes the acquisition easy. He has acquired the *faculty to acquire*.

In reading text-books on science, one often finds that the writer is unable to present his subject accurately because he has never been trained in the use of thought and the art of expression. He is inaccurate, his ideas are badly arranged, his style is obscure and ambiguous. It does not seem to have occurred to him that in order to write a book, one needs to have been trained in that art, and that a knowledge of one's subject is not enough to enable one to write a book on it. One even sees books on English Literature, professing to give a course of instruction in all the great writers from Chaucer to Ruskin, yet betraying a positive illiteracy on the part of the author! Can a man be a real expert in English and yet unable to write a clear sentence?

Superficiality is one of the faults of the day; the desire to learn things without taking the necessary pains, the desire for easy acquisition. The disastrous effect of this is only too apparent when we read the absolute twaddle that is written on all subjects, scientific, literary, and what not, by supposed experts in these matters. We find hasty, one-sided ideas, and look in vain for the well-considered mature opinions.

The arts of speaking and writing are surely the most important features in the scholastic part of education. Yet how rarely we meet anyone who has ever learned to speak clearly and correctly. Speakers who cannot be heard and thinkers who cannot make themselves understood we have everywhere; it might almost be described as a race of paralytics. There are many people with beautiful thoughts, who try to express them in prose or poetry and cannot get to the end of the first line without a

mistake. In mathematics how many people can add correctly? How many people can tell the number of days between dates, or whether the time in San Francisco is earlier or later than that in New York, or some other such simple problem?

We need to train the faculties; and when we set about in earnest to do that we shall find that even that is not the first thing. For, before the mental faculties can be trained, the moral faculties must be disciplined. *Discipline* is at the root of all, and it is the one thing in which we are most deficient.

STUDENT

Chinese Science

WE know that modern science is extremely modern. But a chance remark may now and then bring home the extremeness to our minds.

We do not ordinarily connect China and science at all, but she is—rather, was—only about a hundred years behind us. At the recent International Congress of Applied Chemistry in London, a Chinese scientist, Yu Tung-Kwai, admitted that "China had been kept far behind *during the last hundred years* in the development of modern science." At one time she was far ahead of "us." Alchemy, he said, was known to her as far back at least as 2700 B.C. Her mystics were searching for the "Philosopher's Stone" and the Elixir of Life—probably also trying to square the circle. Metallurgical work and dyeing were even then in full swing:

In the seventh century the Chinese had already a clear knowledge of oxygen. They knew that by burning sulphur or charcoal these substances combined with the oxygen in the air to form new bodies and they had already prepared oxygen from salt-peter.

But they did not keep it up, or we might be now learning about the electrons from them. They "were led to concentrate their attention simply on a kind of most difficult literary work." (We may possibly find out later that they were not altogether wasting their time in that.)

Circumstances have changed. There is a Board of Agriculture and Industries, consisting of various bureaus, and working through provincial committees and experimental stations. There is a chemical society, also with provincial branches; agricultural societies; and commercial guilds with a keen eye to the importance of science. Chemistry is fully taught at the universities, and every province has to have a higher technical college. Chemistry is even a compulsory subject in the elementary schools. He said:

The development of China would do much to benefit the world. Since there was a vast unexplored field in China, the future contribution of that country to the science of the world would be enormous.

And then he added:

The relationship between China and the rest of the world was so intimate that unless China was well developed herself the peace of the world would not be assured.

We might invert and expand the last sentence: Until the peace of the world and the intimate relationship of all its peoples is assured, *no* nation will properly develop its essential genius; no art and no science will reach its possible height. Mind cannot approach its full stature in the present atmosphere of unrest and greed.

Art Music Literature and the Drama

The Welsh Language—Part II

IT is said that the ancient Welsh made much use of the Greek alphabet—Caesar says so—in the writing of their own language; and one cannot but be struck by the similarity of the Greek and Welsh alphabets. They are much more nearly akin to each other than either is to the English, or Latin, or German, for example. Welsh would not look half so obscure if it were written in Greek characters, which would fit it to a very large extent, as it does in Latin characters, which do not. We should write *phi, chi*, and *theta* (ϕ, χ, θ), instead of *ph, ch, th*, aspirated *lambda* (λ) for *ll*, *rho* (ρ) for *rh*, and so on. For there is many a single Welsh letter that must be written with two, or even three, Latin letter-symbols; and even Greek would not help you to simplify the symbolization of such letters as *ng, ngh*—though that last may possibly have been equaled in effect by the combination *gamma chi* ($\gamma\chi$). It is, if one studies sound anatomically, the nasalized form of *k*, and stands to it as *mh* stands to *p*, *nh* to *t*, *n* and *m* to *d* and *b* respectively.

This leads to a most fascinating difficulty, and a most baffling one, that students of Welsh meet with at the outset. Greek indicates lightly a system of consonantal correspondences of which it makes use sparingly, in the way of mutations, in compound words and before and after elisions. In Welsh this is worked out thoroughly, and words transpose themselves into different forms to suit the music of their surroundings, changing their initials as the chameleon changes his color. In ten words of a sentence you will perhaps find only three or four beginning with its own proper initial, under which it is to be found in the dictionary. Your *cath* has become *gath* or *chath* or *nghath*; your *mam* has become *fam*; your *tad, dad* or *nhad* or *thad*; your *brawd, frawd* or *mrawd*, according to its syntax, or the sound of the word preceding it. In this way each sentence is knit up in a most extraordinary manner, a unit harmonious, not straying from one scale; there are no sharp edges of sound, no "mixed biscuits" effects; but one sound flows into another with the rhythm and rapidity of a mountain stream, while yet all slurring and indistinctness remain anathema.

It is as if the language had been made, one third for conveying thought (which any lean drudge of a *patois* will do well enough); and two thirds for conveying music and whatever beauty and dignity may come from

human lips; and this is an office of aristocracy and distinction.

This system of mutations is a great factor in the wonderful alliterative poetry of the Welsh, in which sound is so woven into sound as to make a perfect, delicate pattern; so delicately melodious that you would spoil it, often enough, not by the alteration of a word, but by the alteration of a single letter. Such effects may have been strained after at times; but by no means is strain necessary. From the great masters of the *cynghanedd* it flowed as easily as song from a blackbird. You could have no simpler translation of the sentence—"There was no one in the place but we two, the maid and I," than this of Dafydd ap Gwilym:

at work here, though it would not do to suppose Keats deliberately contrived it. These things come by nature, if justifiably; they sing themselves through the mind, and take hold upon the poet, willy nilly; his brain-mind afterwards is aware of how the spirit of song has declared itself. And this consonancy does make great contribution to the all-sufficing perfection of music in Keats' line. But where Keats used shadow and echo, Rhys and Dafydd and their compeers were enabled, through the high poetic evolution of their native tongue, to give full sound and substance; and that not in isolated couplets, but through poems and poems and poems.

No one knows for how many centuries poets have been at work on this language;

Lomaland Photo. and Engraving Dept.

DETAIL OF ANTIQUE CAPITAL: MUSEO LATERANO, ROME

Un dyn nid oedd, ond ni ein dau
Mewn man, y mun a minnau—

which one would like to write phonetically in the English alphabet, but could not. Or again, hear Red Rhys of the Earl's Land sing of his booth in the greenwood:

Hyfryd ei bryd clyd pan ddeilio
Ty glas parlas purlan arno.

What you must notice is the arrangement of the consonants; the *d's* and the *n's*, the *m's* and the *n's*; the *las, las* and *lan*, the *par* and the *pur*, the *parlas* and *arno*. And then analyse the consonancy in that most magical and musical of English couplets, which contains, be it said, far more of the essence of poetry than either of these two Welsh ones:

And magic casements opening on the foam
Of perilous seas, in fairy lands forlorn.

Perilous, fairylands; fairylands, forlorn; you see there is an echo of the same principle

little poets and big poets; great, full throats of song, and puny little poetkins; at the rate of two or three to every village always; and however little they may have had to say, however perishable their wares, there was always some music among the mountains for them, "a voice on the winds and a voice on the waters"; always some beauty and glory in the language to be brought forth, burnished and displayed. So that the common speech of the people is all shot with strange flashes and quiet glimmerings of poetry; and now and again some phrase will start up in your mind, that you heard by chance from a fisherman or from the farmer's boy, and you will translate it literally, and turn it over and over, and consider how delighted Stevenson, or any of the subtler masters of English style, would have been to have penned it. The spoken sentences stand in a clear light of their own and something dramatic or lyrical or pathetic, a touch of grandeur and simplicity, is seldom far away.

KENNETH MORRIS

For life is, after all, the great teacher.—*Light on the Path*

Carelessness

CARELESSNESS may easily become a crime against the law, and is an offense which is generally regarded with too much indulgence. Recently in Texas there was a fire which wiped out seventy blocks; which rendered five hundred families homeless; and which destroyed five million dollars worth of property. All this happened because a boy was carelessly smoking a cigarette in a barn and carelessly threw it down.

This is an extreme example, but it shows what may be the result. If everyone in the world were equally careless all the time, we should soon have nothing but heaps of ashes everywhere. The Law makes no distinction in physical effects between a lighted match thrown with intent to destroy and one thrown without thought. People are often over lenient in the latter case. Frequently they condole and pity a small offender who has the habit of getting into trouble through carelessness, and excuse him tenderly "because he did not mean to." This may go on for years, until nature takes the matter in hand, as she surely will do if forced to it, and gives the youth such a hard lesson, perhaps, as the one above referred to received. And in time he will have to learn that carelessness is a crime.

For carelessness argues a wanton disregard of the property or rights or feelings of others. It shows a great absence of the sense of responsibility, in some directions at least, and is a form of selfishness which is, in the nature of things, severely punished.

It is often difficult for us to realize that great things are made up of small ones. Any fault that is permitted in the nature may go on to its limit. The senses easily become calloused in any direction, and one becomes strangely used to, and even comfortable in, doing those things which, the first time they were allowed, caused a shock and revulsion of the outraged moral nature.

Characters are not fixed, but very mobile, and are constantly becoming hardened in their existing tendencies, or modified by having these checked. Carelessness is a vice which can run through the whole nature, and will do so if not handled with force—and it will vitiate everything.

One who becomes careless as to his own character is incapable of any constructive

JULY

WHEN the scarlet cardinal tells
Her dream to the dragon fly,
And the lazy breeze makes a nest in the trees,
And murmurs a lullaby,
It is July.

When the tangled cobweb pulls
The cornflower's cup awry,
And the lilies tall lean over the wall
To bow to the butterfly,
It is July.

When the heat like a mist veil floats,
And poppies flame in the rye,
And the silver note in the streamlet's throat
Has softened almost to a sigh,
It is July.

When the hours are so still that time
Forgets them, and lets them lie
'Neath petals pink till the night stars wink
At the sunset in the sky,
It is July.

Susan Hartley Swett (Selected)

growth. The elements of destruction set in and find him an easy prey to disintegrating forces. Evolution means *effort* on the part of the one who is to evolve. This is a keynote in the message given by all of the great World Teachers. It is one of the fundamental teachings of Theosophy as opposed to the demoralizing doctrine of vicarious atonement which has for so long retarded man's evolution. For the latter was never any part of

any teaching given by the great Nazarene, but utterly opposed to it, and it was not introduced into the church by those who had man's welfare at heart. It is a doctrine which is responsible for a most serious kind of carelessness, and all should do all in their power to remove as quickly as possible the effects that this has had upon the race.

We need to keep constantly alert, first and foremost, in regard to the lazy and selfish tendencies in our own natures. They exist in all, and the needs of the world are so deep, and the suffering so keen, that nature is making an especial appeal to all to gird on their armor and do their utmost to stem the tide of this selfish vice. STUDENT

Mind-Surfeit and Heart-Hunger

A SINCERE, brilliant, educated woman in mid-life, after a varied literary, professional, and business career, writes to a friend this familiar cry:

If I were a multi-millionaire I would just build retreats for weary souls—for those who are defeated, disillusioned, heart-sick. God knows there are many who are staggering on with a useless burden—and all for what? For my part I am tired, tired, tired of it all. I have learned that it is all "fool's gold," . . . and so I have no courage or faith to go on. I have just returned from a two-days' visit in the country. Last night I sat on the hillside in the moonlight looking out over the river and this afternoon I lay on the pine needles looking up into the trees and into the sky beyond. O God, what is it that calls and calls and seems to break one's heart and wrench one's soul away—out of oneself—in times and places like that? Is it the cry of the soul for its own or is it only nerves and ought I to take Ignatia 200th? What is it all about? and are we, as we seem, mere "bubbles of saki?" I know you think not, but *how* do you know? How can we know? Perhaps Mars is going to tell us. Certainly we need bitterly enough to know something in these weary days of restlessness and despair. . . . Intellectually I accept all that Theosophy teaches but all power to *feel* the truth of it, or of anything, seems dead.

Paradoxically, this woman's supposed failure to feel the truth of Theosophy is evidence

of her feeling it—and in greater degree than do the conventionally satisfied. Something real is insistently aware of the unreality of her life even though it is of wider range and filled with more varied interests than the average man's or woman's.

A decade or two ago the awakening modern woman who was impelled to break down the barriers by which custom had long hemmed her in, sought the wider life in new fields of thought and work. The conventional alarmist prophesied her desertion of home ties and duties which would result in grave social dangers, and further avowed that "only disappointed women wanted careers."

Now that woman has practically proven her business and professional ability and the homes are at least more intelligently managed than before, she has shown her right to the larger liberty—and yet, and yet—not a few of the most successful and popular women, with congenial home and family ties, have this hungry cry within their hearts and often on their lips.

One Theosophic truth is that the soul ever seeks to express itself and its power and scope are so great that the widest reach of the intellect is but a limitation to it. What chance does the average life offer for a conscious expression of the higher nature? Are not the physical and the mental senses the usual centers of action? It is the mind and the body which would retreat to some secluded place where the misery of the world could be shut out; but the soul is here to transmute the misery into harmonious life. The soul does not seek out retreats; it is sick with stagnation and suppression and longs to bring its own home atmosphere to the world in a life of glorious action. For ages it has had too much drugging with narrow theology, and now it is heavy with intellectual surfeit and materialism. It longs for the clean, normal, purposeful, free life which belongs to the higher nature.

What else than the soul would impel the sincere, seeking natures with the urge which transcends any mental ability to fulfil? The materialist or the self-seeking intellectualist can yet find enough physical or mental gratifications for their desires to drown that inner voice. But they too, in some life, will have run the gamut of gross and of aesthetic sensations, and perforce must find their peace in the liberating calm of a larger sense of being.

It is not uncommon to find these honestly active, intuitive woman natures nervously broken down, not from overwork as usually diagnosed, but from a one-sided mental development which has reached a point where further progress must be on higher lines. The call is from that inner something which demands recognition and a right to work its will in conscious, worthy service. To realize, even partially, that one is a soul, incarnating life after life for the gain of greater power and knowledge which comes from earthly experience, leaves no time or place for weariness or despair.

The mental function has a certain satisfaction as it opens up new worlds of thought and lures the student on and on. But the mind is only a fraction of the whole nature and proves itself at last to be but a beggar in the king's palace by its inability to direct and control the retinue of forces in a royal life

of service. The mind is subordinate to the power which uses it. Having aroused so much mental force, there are many sincere, intelligent modern women who are physically, mentally, and morally shaken with the forces they have evoked without learning how to master and direct them. Life is more of a problem for them than for the average, and they have less faith because of their mental preconceptions. As an ancient book says: "But even ignorance is better than Head-learning with no Soul-wisdom to illuminate and guide it." L. R.

A Woman's Success

ONE of our largest American cities is the home of a woman who was forced into a business career at the age of twelve by her father's illness and death. Her mother's health was poor and when the father—

bills, and kept the books. As if this were not enough to test her mettle, she encountered for a time the bitterest opposition from rival drugstores and local members of the drug combine. Finally she was cut off entirely from obtaining supplies through the regular channels and not until she brought suit against her persecutors and won her case in the courts of law did the persecution cease.

This woman recently said that the secret of her success was system, order, and a habit of not stopping to think of herself when a task lay before her that should be done. In each of her stores she employs a woman clerk to wait on woman patrons, and believes that women are, because of innate neatness and conscientiousness, eminently fitted to do prescription work. "If we will take care of our duties and without complaint," she says, "our success will take care of itself." H.

CUPIDS AT PLAY. FRESCO DISCOVERED AT HERCULANEUM

a druggist—became paralysed, this girl, then little more than a child, courageously gave up her school and insisted upon taking the business cares off her father's shoulders. With his help she learned all the details of the business management of the store, at fourteen entered the School of Pharmacy in the city, and at sixteen graduated as a druggist—the only woman in a class of ninety—all this while continuing her oversight of the store and the care of two invalids.

That was twenty years ago. The father and mother are no longer alive but the daughter has the reward of knowing that they lacked nothing that money or devotion could obtain while they lived. Today she is the proprietor of nine of the leading drug stores in the city, and has 150 people in her employ.

Nor did this business success come without effort. In the early morning, when other druggists and clerks were still sleeping, this girl would go to the store, open it, light fires, clean floors and wash windows before the arrival of the earliest possible customers. Too poor to pay a clerk at first, she herself filled prescriptions, waited on customers, made out

Fanny Kemble

THE influence of Fanny Kemble upon the dramatic ideals of her day was marked, and to recall such courageous souls awakens hope for a purified drama. Says a recent writer:

VIEWED from whatever point one may, the conclusion is that Fanny Kemble was a remarkable woman, so closely allied to a genius that she narrowly missed being so classed. Her acting, her writings, her personal influence, her great faith in a Divine Creator, her poetry, all bespeak her strong character. Her best work is seen in *Record of a Girlhood* and *Records of Later Life*. . . . A worshiper of God and nature, she had a great love of and sympathy with all creatures in distress or in need of love. She delighted to aid others and was blissfully happy when she could give all her earnings to her father, amounting to \$35,000, following her marriage, when his theatrical venture had left him stranded.

Fanny Kemble died in the land of her birth, at the home of her younger daughter Fanny, the wife of an English clergyman, in her eighty-fourth year. It is probably known to few that her older daughter, Sarah, married Owen Jones Wister, the father of Owen Wister, the author, thus transmitting to her son the literary qualities of his grandmother, Fanny Kemble.—S. T. C., in the (Los Angeles) *Graphic*

OUR YOUNG FOLK

Russian Folk-Songs

NO country in Europe has more varied and charming folk-songs than Russia, nor a greater number. There are songs of nature, songs to be sung as an accompaniment to dancing, humorous ditties, wedding songs, funeral chants, and songs descriptive of the adventures of giants, robbers, and heroes. It is said that every Russian artisan and peasant sings while he works. The Russian folk usually sing without accompaniment except when some ancient instrument, peculiar to the country is used. They have a primitive guitar, among others, which they call a bandura, and the gondok, a violin with twenty-three strings. These instruments are in a measure responsible for the limited compass of the Russian folk-song, which gives to them their most marked peculiarity. Few of them exceed an octave, and some, the most ancient, are limited within a fourth.

The history of Russia has not been a happy one, to say the least, and so the songs of her folk are mostly sad and in a minor mode, and express melancholy and tenderness usually. Even those in a more joyous, hopeful strain, written in the major, end with a minor chord. In the Russian army the soldiers sing national melodies in barracks and on campaign. Every company of infantry has a choir of twelve or more soldiers. When their comrades grow tired on the march, they gladly respond to the command of their officer, to go to the front and sing favorite national or military songs. Russian sailors, too, have their peculiar melodies. Along the river Neva they may be heard continuously.

Russian folk-songs are especially remarkable for the close correspondence between the melody and the words. The feeling expressed by the words and the emotional character and accents of the melody are as closely wedded in these primitive songs, as in the art songs of Schubert and Schumann. This gives to them the peculiar, free, capricious, irregular rhythm that is so striking.

There is in the Russian people a deep and tender love for their country. They usually prefer to remain there, even if they suffer tyranny and oppression, rather than seek a new home in a happier land. Perhaps the folk-song, giving as it does, in both words and music, full expression to the Russian heart, is one of the magic threads that bind them to their native hearthstones. STUDENT

CUBAN PUPILS AT THE RAJA YOGA ACADEMY, POINT LOMA

THE WILLING SLAVES

THEY are slaves who fear to speak
For the fallen and the weak;
They are slaves who will not choose
Hatred, scoffing, and abuse,
Rather than in silence shrink
From the truth they need must think;
They are slaves who dare not be
In the right with two or three.

Lowell

Long-Lived Icelanders

THE effect of simplicity and industry is to be plainly seen in the longevity of the Icelanders. In the census report of 1905 it was found that the average length of life was 61.8 years, almost double of that taken a generation ago. It is interesting to notice that this average greatly exceeds the average in Sweden and Norway, both considered very healthful countries.

Iceland is a remote place and is little affected by conditions in the world. Although it has many and severe earthquakes, there is little else to shock and excite the people. Evidently the longevity in Iceland is due to the manners and customs of the people. H.

Berne

ON the desk above my head, standing on his hind legs and looking down at me, is a little carved wooden bear, not more than five inches high. He is made of black walnut, but so wonderfully carved that he almost seems like a little live bear, he looks so natural.

I remember the tiny shop under the long stone arcades where I found him. The shop was full of carved wooden bears of all shapes and sizes, some large enough to serve for umbrella racks, others small enough to hang on your watch chain for a charm. Then there were many other beautifully carved articles, picture frames, cuckoo clocks, little Swiss chalets, etc.; for you must know that the Swiss people are famous the world over for the exquisite wood carving they do.

But of course I chose a bear from Berne, because Berne is the "Bear City"; and the way it came to be called so is this: many hundreds of years ago a brave duke killed a very savage bear which had frightened the people for miles about, and he then resolved to build a city where he had committed the deed. He called it Berne, which means bears.

There are two large bears carved of granite, ornamenting the city gateway, and in one of the principal streets a statue of the brave duke himself with a bear standing beside him holding his helmet.

The city every year supplies funds to keep the bears in the great bear pit, where live bears have been kept for centuries. You can visit them any day and watch them sit on their haunches and beg for food, which the visitors toss to them, or climb the great trees which are in the pit for them to exercise upon. The people are very fond of their pets, and once when the French came and took them away there was great sorrow in Berne; but when the trouble between the nations was over and they were brought back, you can imagine how they rejoiced.

Berne is beautifully situated on the winding river Aar, and is nearly surrounded by snow-covered Alps. It has always been one of the foremost cities of Switzerland and has always stood for the freedom and rights of the people. E. N.

To nourish the heart there is nothing better than to make the desires few.—*Mencius*

City and State

Loma: Knowing well how much you like to go for long walks and have adventures and discover things, with your teachers' permission we shall visit the Râja Yoga Academy at Pinar del Río, Cuba.

We have found the house, but how we cannot tell this time. It is more like some fairy-story place, where one enters through a door or opening in a mountain or hill-side, looking like everything else, and then, to one's surprise, steps into a beautiful palace.

There is a veranda supported by a row of columns running the whole length of the house, and it seems a long walk to go from one end to the other. The veranda is big and broad so there is room for groups of chairs and tables, urns and vases with flowers, school-benches—yes, school-benches! How would you like that? The children have classes there, as well as in the school-rooms which also all open out to the veranda and patio.

The patio is closed in on three sides by high walls which one cannot look over, and on the fourth side is the house. Now we shall go out and see what is growing there.

The mistress of the patio, standing in the center, is a big mamey tree. It is rich with great, oblong brown fruits, which are very delicious, and it wisely holds them high up so as not to have them disturbed before they are ripe. It does not let any convenient branches grow low down on the trunk, which might be dangerous to the fruit, so only the boys, who have learned to climb like squirrels can get its treasures. Near the wall are some coffee trees. They have shining green leaves, and, when in bloom, beautiful white flowers; but it is their vacation time now; only a little of the ripe coffee is still on the branches.

Bananas and other tropical plants and flowers are also growing there. In one corner near the gate stands a palmtree looking over the wall and the roof of the house. We can see at a glance that it holds the position of guard, and gives warning if any danger should approach from outside. There are other palms too, like those we have at Point Loma, and fig, almond, and several other trees with

Lomaland Photo. and Engraving Dept.

PLAYING AT SCHOOL IN THE ROTUNDA OF THE RÂJA YOGA ACADEMY, LOMALAND

strange fruits. Near the veranda grow many flowers and some plants with beautiful colored leaves, vines with clusters of pink blossoms are climbing on a fence, and curious plants which take root and grow from one of their leaves thrown on the ground.

The big tree with the swing in it is a chirimoya tree. It looks full of large, whitish gray fruits. They taste like some nice desert cooked in the kitchen, but the fire they are cooked with is from the sun. In fact, many of those delicious fruits are cooked by the sun until they are soft.

How many strange and wise ways of working Nature has! How different in different lands! In some places man must dig and water and watch early and late to win from the soil the means to exist; in this land the richest things grow almost without the care of man.

What is the meaning of it all? Is it possible that Nature made everything ready so that man should have an easy time and do nothing? No, this cannot be, because such never was and never is Nature's method at any time or place. Might not Nature have something else for them to do instead? Think of the great opportunities for art, poetry, music, knowledge, and for helping others!

Mother Nature is kind and generous, but her children must obey her, otherwise she is very stern in her justice. If the people take a mean advantage of all the good things and get lazy and selfish; then they grow more and more weak, ugly and misshapen in body, ignorant, and foolish. They get poor in the midst of Nature's riches, and have to work

hard to live. Such people can help no one.

From dangers like these the Râja Yoga Schools are saving the beautiful island of Cuba. They are sacred places from which help, light, courage, knowledge, flow out, so that the people may learn to use rightly Nature's bountiful gifts.

We enter the house. The children are there and it is time for school to begin. Big boys and girls are there, and little tots. Listen! They are repeating together the beautiful words of Katherine Tingley, "The knowledge that we are divine helps us to overcome all obstacles and to dare to do right."

Day by day in school, while they are learning their usual lessons, they are also learning this. They learn it from the example set before them in their teachers' own lives, just as you are taught. YLVA

A Kind Horse

A FARMER was slowly driving his team along a road near his house. Suddenly the horses stopped short. Looking to see what was in the path, he saw one of the horses gently push aside with his foot a little black kitten that was sitting innocently in the wagon track. Then the horses started on without a word from the farmer. J. H.

Modern Science Indorses Ancient Science

THE Cult of the Circle Builders is the title of a book reviewed in the *English Mechanic*, from which review the following is quoted.

In the summer of 1905, when in the Shetland Islands, the author's attention was directed to the Stone Circle of Hestingsgarth; a casual inspection showed that it was a structure of much interest, therefore a second visit, with proper measuring instruments, was arranged. When the measurements were reduced, the astronomical data, such as the solar solstitial marks, and the co-amplitudes of a Boötis, were at once found. Subsequently, the foot used by the Hestingsgarth Circle builders, and the secret number of the Sun-god, were worked out solely from the study of this monument, and quite independently of books or knowledge of any other stone circle. When the author returned to England other circles were examined, and with much surprise the same foot was found there, as well as the cult of the number of the Sun-god. The cult of the trigonometrical functions, and of the areas of the right-angled triangles, was discovered in England....

With respect to the astronomical significance of stone circles, Mr. Nelson thinks it is very doubtful if there was any beyond the laying-out of the prime vertical, and the indication of the sun's solstitial amplitudes

Unfair Treatment of Data too Common

After pointing out that, in the case of many stone monuments the theorists have probably overdone their work and unfairly selected or rejected facts as the views demanded, the reviewer goes on to say that—

With regard to the cult set forth in this work the case is different. All the bearings which have been investigated pass through the center of the circles, and all point to the same conclusion. Take, for example, says Mr. Nelson, the Cursi at Stonehenge, the bearings of the three extremities and their respective right-angled triangles, and there are no more than three, all tell the same story; all the groups of tumuli at Stonehenge and all the long barrows, have been investigated, both at Avebury and Stonehenge; all the circles and stones at Stanton Drew have been dealt with; there has been no selection and retention of data which fitted the cult, and rejection of that which gave negative results. Anyone wishing to examine for himself the data given in this work cannot do better than begin with Stanton Drew....

Mr. Nelson does not offer any adequate theory as to the race or genus to which the Circle builders belonged; but the fact that the Assyrians, Babylonians, and other Semitic races practised a similar cult would seem to indicate that the Circle builders were akin to, if not identical with, one or another of these races.... The presence of the same linear measures at Baalbec, Great Zimbabwe, and in British Stone Circles is very significant of a Phœnician origin.

Mr. Nelson is of opinion that the architect of the Hestingsgarth Circle wished to stamp his temple with the sacred number 666, and that a similar purpose actuated the builders of Stonehenge, Great Zimbabwe, Hiram's Tomb, the Great Pyramid, and the Tower of Babel.

It is gratifying to find that science, so far

as it is pursued with a regard for the facts and the truth, leads to a confirmation of the teachings outlined by H. P. Blavatsky in *The Secret Doctrine*. For these teachings were not invented by H. P. Blavatsky, but are merely those of the "Secret Doctrine" of antiquity, whose actual existence she maintained and which she considered so vitally important to the human race. As she so frequently averred, *Theosophy welcomes the gathering of facts*; for, as the teachings of Theosophy are truth, and what H. P. Blavatsky states about the ancients and their Science is fact, the discoveries of science confirm them. It is only the theories of some who claim to represent science, when such theories are prejudiced by dogmatism, that can conflict with Theosophy; but equally do they conflict with the facts, which, as the author quoted above shows, have in such cases been twisted into conformity with the dogmatic theories.

Theosophists, many of them students of H. P. Blavatsky, have the constant gratification of seeing scientific discoveries confirming the truth of her teachings and contradicting dogmatism, theological or otherwise. But they may justly claim that the strenuous work done by H. P. Blavatsky during her lifetime, and by true Theosophists after her departure, has contributed the principal share in bringing about the present enlargement of ideas—whether by the direct influence of her writings and of the Theosophical literature, or through the invisible channels of thought-influence.

The kind of remarks quoted above are in the columns of a representative and typical scientific weekly; no cranky publication addicted to out-of-the-way corners in speculation, but a practical common-sense paper. The kind of remarks quoted above were, but a few years ago, only to be found in cranky publications, unpopular and devoted to by-paths of speculation. What a change has come over thought! The truth is great and shall prevail; and so long as science devotes itself to discovering facts, the truth will reward it.

Truth Waits Only on Sincere Research

But thinkers must beware of the dogmatizing tendency and of the subtle hypnotic influence of past training. In the very article under consideration we believe we find the signs of such influence. For is not the writer of the book on Stone Circles apparently enslaved to theological tradition in his efforts to make his facts support the book of *Revelation*? A mind unprejudiced by such traditions can scarcely suppose that all the countless placed stones in the world, including those if you please in America, were erect-

ed under the inspiration of Christian monks!

Many intuitive students have investigated the problem of ancient science as indicated in ancient monumental records; and, as was to be expected, they have in too many cases allowed their minds to be colored by some fad or other of their own. Whether it is about the *Revelation*, or the *Book of Daniel*, or the Lost Ten Tribes, or (as in the case of the reviewer, apparently) the Phoenicians, or whatever the theory may be, the facts have too often been made subservient thereto. But for the student who will read and compare the results and conclusions of many different writers, a field of promise lies open. For their special theories will neutralize each other, while their facts can be put together.

We must not try to limit ancient science by modern ideas. If we are only seeking for confirmation of our own previously formed theories, our judgment will be prejudiced. In exploring a new country, we must be prepared to find unfamiliar things. We should ascertain the facts first, and postpone our conclusions. And is not this the scientific method?

The ancient science that inspired the erection of these stones and is recorded in them, was very comprehensive and hardly corresponds with any one of the categories of modern knowledge. If we attempt, therefore, to label it "astronomical," we are limiting our minds; the same if we try to call it "mathematical." The characteristic feature of the ancient science, as contrasted with modern science, was its unity; it was a *master-science*. The

unity of all things was recognized and expressed in it. And is not our own science tending towards such a unification?

Number and numbers, as Pythagoras taught, underlie the whole scheme of Nature; and to understand the deeper mysteries of mathematics was to possess the clue to all possible branches of Science. Astronomy, the real period of the celestial bodies, and the real duration of the cycles dependent thereon, were understood by this clue. This clue unsealed the mysteries of Nature, both external to man and within him; and no distinction between religion and science was known.

Likewise it is evident, to an impartial mind, that this knowledge was once diffused over all quarters of the earth; and this works in with recent discoveries in archaeology tending to show that great civilizations have flourished in the remote past. The theory about the Phoenicians is altogether inadequate to account for such universal diffusion.

The People's Hunger for Something Real

A WRITER who is contributing to *Black and White* (London) a series of papers on "The Future of Britain," advocating a policy of preparedness for war, entitles number 6 of his series, "The Religion of the Nation"; and though the policy of the articles does not concern us, some of the remarks in this one will be of interest.

He says that the idea that the British democracy is indifferent to religion (except in the case of the hungry), is founded for the most part on superficial observation of the facts.

The men who are doing the work of the world, whether by brain or manual labor, yearn for the living God and for a faith they can hold at work and at play. . . .

The modern spirit is not irreligious, but it revolts against theological cajolery. . . . The doctrine of eternal fires and the "worm that dieth not" is discarded by the majority, and, if something more specific than rumor does not misinform me, the Bench of Bishops themselves are no longer unanimous as to the validity of the message that they accept and teach.

But men do not seek relief in science; they seek it in psychism and "Christian Science." Free Church pastors quit the spiritual for the political arena; the national Church temporizes over dogmas she no longer holds; and among the masses the yearning for certainty daily grows stronger.

There is abundant evidence that a spiritual wave proceeding from the unrest of the world is rolling in upon us. . . .

The attempt to define the indefinable, to prescribe an impossible standard of conduct, to require from a commercial and competitive society the virtues of religious ascetics, are precepts found no longer to work out in practice. . . .

Britain in her inner soul is wearied nigh to death, not with effort, but with unbelief. . . .

Nations learn religion by universal effort and sacrifice; not by whining for paradise. . . .

The hope of the nation is to be found in the recovery of the principles which Jesus implanted (says the writer) — the brotherhood of man and the vitality of sacrifice.

So the Bench of Bishops themselves are not unanimous as to the validity of the message they teach! A serious state of affairs indeed. And the people are starving for spiritual food, which they can find neither in religion nor science, and are trying to eat the poisonous stuff offered them by psychism. And religion is impractical, ignoring present-day conditions and needs and teaching doctrines adapted to another age and other conditions. Instead of showing men how to live in present conditions, it is denouncing those conditions. Of course evil conditions ought to be denounced, but modern institutions are not necessarily evil. And universal effort and sacrifice is needed in order to teach people religion, says the writer.

Certainly we must have a recovery of the principles of unity and the validity of self-sacrifice — whether Christ implanted them or not, whether Christ was the only one to implant them or whether other Teachers implanted them also. But the churches cannot bring this about, it seems; nor can science, nor psychism. How, then, is it to be brought about? Perhaps some may think it will arise spontaneously in the hearts and minds of the people. But, if so, it will need guidance and form and coherence. The yearning for certainty, spoken of above, will not rest satisfied with vague emotions or fantastic speculations.

Years ago Helena Petrovna Blavatsky felt the same yearning for reality and the same dissatisfaction with the conditions of life. And she went and sought out Those Who Know, and found that there was such a thing as a "Secret Doctrine," which has been in existence in all ages, was known to the world at large in the far past, but is now held in trust for humanity, during ages of unspirituality, by those competent to guard it. This Secret Doctrine is the key to all religions and sciences. Receiving initiation into its mysteries, she came back to the world to impart the light she had received. It is largely to the efforts of

H. P. Blavatsky that the world is indebted for the "spiritual wave" it is now experiencing.

In the teachings of Theosophy men will find that definiteness and certainty for which they are seeking. They will find in Theosophy the formulation of their own intuitions and aspirations. The practical working-out of Theosophical principles, as seen in Theosophical institutions, will give them the tangible proof they need. The people may be wearied with unfulfilled pretensions and false hopes, but they still possess the power to recognize what is genuine and real when they see it. STUDENT

Message from Shakespeare

ONE of the most surprising things in the spiritistic hypothesis is that a circle of unimportant sitters should claim to be able to summon, out of the innumerable ranks of the dead, whatever great personages they may choose to name. The fact is incredible on the theory that the communications are really from those personages; it suggests a most disappointing view of the state in which the mighty dead are abiding. But, on the theory that the communications are not from the mighty dead at all, but from some kind of beings or influences which personate them, the facts become comprehensible.

There does exist an astral world, permeating, and in other mysterious ways related to the physical world. It is peopled by beings of various kinds, more or less intelligent, more or less automatic — as are the creatures on earth. By certain practices to which spiritists resort, we can get into communication with this world. By virtue of this communication certain phenomena occur: various bodily functions — the writing hand, or even the whole nervous system, may become the means, through control, of communication from some other mind or thought-deposit, and thus messages may be received. Physical phenomena may occur without any visible intervention of the physical body, such as raps, apportation, etc.

But to assume that any message received by one of these means, and signed by some particular name, is actually from the owner of that name is too great an assumption. Yes, even when the message contains references which seem to establish memory and identity, still the assumption is too great — until (as science says) every other possible explanation has been exhausted. And the properties of the astral plane and its denizens will account for all the phenomena without any occasion to resort to the improbable theory that the spirits of the dead are concerned.

In a review of a book called "Talks With the Dead," it is stated that communications are given from Dan Leno (the comedian), Shakespeare, Longfellow, Carlyle, Mrs. Carlyle, and Talmage. The communicating entity, be it a spook or a part of the medium or sitters, will take any shape that may be given to it by the imaginations of those present. Shakespeare said: "There is the pronoun, *hic*, *haec*, *hoc*, genitive *hujus*. I remember that well. I think I got on as far as *amo*, *amas*, *monco*, *audio*, the auxiliary verb being preliminary, *sum*, *es*, *est*, *sumus*. There commenced, and there ended, my knowledge of the ancients. I got on just as well without it."! Here endeth the first lesson. STUDENT

Some Views on XXth Century Problems

Self and Mind

THE case of Mr. Hanna has provoked and is still provoking much discussion and study, medical and lay; but no one seems to have noticed the essential thing it is calculated to teach.

He is a well-educated and intelligent clergyman, thoroughly capable of describing the curious experience that befel him. This experience followed upon an accident, a fall upon his head, after which he remained unconscious for two hours. When he recovered consciousness his mind was as blank as when he was born, contained nothing whatever. He had to begin life again, even had to learn again how to walk. The entire program of education had to be undertaken.

But since there was an adult brain already present and no growing of one necessary, his progress was very swift. In six weeks he had traversed the life of infant, child, and young man. But there was no memory of anything preceding the accident. He lived in a new personality.

Then, more or less suddenly, the old one with its memories awoke. A conflict lasting two hours, which he describes as "one of the most intense struggles he had ever experienced," ensued. The two personalities

arose simultaneously and confronted each other. . . . It was a struggle for life between two individualities formed in a single mind, each one endeavoring to gain ascendancy and to suppress, to crush, the other; and still neither could be suppressed, because each was part and parcel of the other. . . . I was willing to take either . . . I was trying to find which I might most easily forget. . . . Finally I decided to take both lives as mine. . . . I have now retained both memories, I am sure both are mine.

After this his recovery was complete.

Two of the best commentators upon this case, Drs. Boris Sidis and Goodhart, remark that

Although Mr. Hanna was mentally blind and had lost all knowledge formerly possessed, both in relation to the external and internal world; although he was mentally reduced to a state of infancy, strange to say, his intelligence remained intact. His curiosity for acquiring knowledge was keener than ever, and the use he made of his acquisitions was truly astonishing. His faculty of judgment, his power of reasoning were as sound and vigorous as ever. The content of knowledge seemed to have been lost, but the form of knowledge remained as active as before the accident.

In incarnation the soul-ego finds itself with an utterly immature brain instrument. There are years to be spent in the development of the instrument and in its training. Mr. Hanna's case only differs in that the instrument and training were already complete. The soul-ego, coming from a line of former incarnations, carries or is the man's character, is the man himself. This proceeds to learn things and to occupy itself with the world. It is finally surrounded with its mental acquisitions, reacting upon them in modes of thought and action in accordance with its innate character. The total *apparatus* of acquisition, action, habit, and memory, thus trained by the incarnate character-soul, constitute the personality. That this soul is *an entity apart from the apparatus* is

shown by Mr. Hanna's account. His apparatus had been *twice* filled up, making, in a sense, two personalities because there were two distinct masses of memory. But *he*, the soul-ego, stood consciously apart. "I was willing to take either." As a matter of fact they were both *his*, not *he* himself.

The problem faces all of us — to recognize ourselves as we are behind the personality, the acquisition and action *apparatus* which we have developed since infancy. It is this apparatus which begins, grows adult, grows old, dies. The man himself passes on, much or little the wiser for the experiences of that life according as they have been reflected on or not. We have to learn, at moments, to part self or soul from all that, to look in at self instead of out at self's mind, acquisition apparatus; and then, going still farther in, to find the wholly divine root of self, the meta-self, the god; and then, still farther, the root of all selves.

STUDENT

Ancient Knowledge

MR. SODDY, co-elaborator with Professor Rutherford of the theory of radio-activity, and of course a chemist of the very front rank, has been bringing a certain amount of learned displeasure upon his head. He may even have risked excommunication.

He recently went to Glasgow University and gave six lectures upon his special subject, now publishing them in abstract. He dwelt particularly upon the titanic amount of energy that would be at our disposal if we could unlock the atom quickly. He was all right so far. But at this point begins his crime. Says a reviewer, commenting upon his next step:

It is with a sensation of the gravest misgiving that we follow the writer, a man who has achieved distinction in the mastery of a difficult subject, when he suggests that the myths and legends of our unsophisticated ancestors are the traditions carried down to them from enormously more remote progenitors, who lived in a state of transcendent happiness and power due to a profound knowledge of radio-activity and the ability to explode atoms.

Mr. Soddy has evidently been reading the traditions of the glory of Atlantis in her highest days and believes that her people must have had a secret of atom-exploding subsequently lost — because misused, we should say; just as our civilization would misuse it. We no sooner discover a new trick with the forces we have, than we seek to apply it in guns and bombs. Mr. Soddy seems to think that the Atlanteans merely made some sort of technical mistake. He says:

One can see that such dominance (over intra-atomic forces) may well have been short-lived. By a single mistake, the relative positions of Nature and man as servant and master would, as now, become reversed, but with infinitely more disastrous consequences, so that even the whole world might be plunged back again under the undisputed sway of Nature, to begin once more its upward toilsome journey through the ages.

This beginning — though the case was not quite so bad as Mr. Soddy thinks — was the origination of our own Aryan race.

In somewhat the same key Mr. Buckland writes concerning old Maori knowledge. He says, in *Knowledge and Scientific News*:

Certain it is that the priesthood of the Maori race possessed powers which can be explained only by processes into which we are but now acquiring an insight, while others again were of such an extraordinary nature as to be at present wholly inexplicable.

After enumerating and describing some of these powers, he suggests that they

were the relics of a very ancient system of knowledge which the Polynesians brought with them from far-away India, and which probably they acquired from some of the Aryan races.

According to Theosophy, since the days of Atlantis there has never been a whole people which has had access to such inner secrets of nature. This knowledge was in the custody and use of Initiates only — save in the case of fragments, mostly devoted to purposes of sorcery — men who still retained it because they alone had never misused it and who handed and hand it to such pupils only as were or are worthy and well-qualified. That worthiness, whether of individuals or a whole civilization, remains the absolute condition of acquirement.

"New Thought" Among the Chinese

A RECENT book on Sir Robert Hart tells a story of the present Chinese ambassador to this country, Wu Ting-fang. It was in the days before he came here and he may know more now. His alert manner and youthful ways made him seem younger than he actually was, and when this was remarked to him he would reply that he meant to live to two hundred.

The prescription in part, the rest being dietetic, was this:

I have hung scrolls in my bedroom with these sentences written upon them: "I am young, I am healthy, I am cheerful." Immediately I enter the room my eye falls upon these precepts. I say to myself, "Why, of course I am," and therefore I am. Was ever simpler and saner method discovered for warding off old age?

It might ward it off. But it would hardly result in immortality. In due time the assertions as to youth and health would be manifestly untrue. How then? The "I" has firmly asserted and hypnotized itself into identity with that which *was* youthful and healthy and is no more so, and must manifestly die soon. It has more or less securely limited its consciousness of being to consciousness of *physiological* being, to something whose extreme endurance, even according to the sanguine assessor's extreme estimate, is two hundred years. How much better to have "asserted" the "I" into unity with something that is immortal. There is such an element in human nature, a *light*, a center of compassion and other kinds of divine feeling. The results of the other assertions would be just as full, while the cheerfulness would deepen from year to year. The other part of the prescription is merely dietetic. We are to be vegetarians, avoid salt, and take nuts and olive oil. C.

Science and Dogmatism

MUCH as science has done, and is doing, to loosen the bonds of superstitious ignorance, those bonds still cling tenaciously in not a few places. It is not easy to free the mind of a hypnotic impression graven upon our racial consciousness by ages of theological domination.

In commenting upon Lieutenant Shackleton's Antarctic expedition, a paper says that south of Magellan's Straits there is a great unknown continent which the veil-tearing hand of exploration has but little disturbed and about which prying man has known least. Scores of men had set out for the North Pole before ever man turned his attention to the fact that there was also a region at the southern extremity. Four centuries ago, soon after *Columbus had established the fact that the earth was round*, men began to explore the Arctics; but it was not until the latter half of the 19th century that man began systematic explorations for scientific purposes. It was not until about that time that science really reached its remarkable ascendancy, and not until then that the human race became vitally interested in knowing about things that could not be converted into the materia of trade.

Here it seems as if science were being misrepresented. For the great bulk of scientific men, being fair-minded and well-informed people, would of course admit that the roundness of the earth was known to ancient Greek astronomers, who even studied spherical mensuration in connexion therewith. They would also be aware that the ancient Hindû treatises give data concerning the diameter and the circumference of the earth, with formulae for ascertaining the circumference of a lesser circle of given latitude. Hence, to credit Columbus with having established that fact is, as said, a reversion to theological misrepresentations — unless indeed the writer is speaking only of comparatively recent times.

While the rise of modern science has indeed marked a recent emergence from darkness on the part of our own race, it should not be forgotten that the world is very old, and that great civilizations have arisen, flourished, and passed away time and again before ours. Past races have explored the earth, north and south; past science has been interested in things beyond the materia of trade. We can gage the attainments and capacity of some of these ancient civilizations by their vestiges; and we must concede them an intelligence and enterprise in proportion to their prowess in

building, craftsmanship and in artistic work.

Science, in fact, admits the former existence of a great southern continent, called by Sclater "Lemuria," and written about by Alfred Russel Wallace; and though perhaps not yet ready to admit the existence of man upon that ancient continent, yet it will undoubtedly do so later. For a great field lies before science if it can stand true to its unprejudiced love of the truth and avoid falling into dogmatism of any kind.

The Tower of Babel

NUMEROUS attempts have been made to identify the "Tower of Babel" spoken of in the Bible. According to a British Assyriologist, excavations have proved that the Tower was square, and not of the circular tapering form shown in fancy illustrations. It was about 309 feet each way, and of about the same height. The lowest stage was the largest, and the highest was the temple of Bel or Merodach. But the remains have been cleared away to make room for the dam of a canal. This tower is the one at Birs Nimrûd, a suburb of Babylon.

But the Tower of Babel is an ancient "mythos" to be found in many other places besides the Babylonian mythology. The Greeks said that the Titans tried to storm heaven by piling up three mountains. The lightning-struck tower is one of the symbols of the mystic Tarot cards. Historically this legend has one reference to the black magicians descended from ancient Atlantis, who, when the Fifth Race was establishing itself on

earth, attempted to found an empire of sorcery but were defeated by the Sons of Light. The event is pictured in the *Mahâbhârata* of India, in the account of the war between the Olympians and the Titans, in the Scandinavian mythology, and in short, in all the ancient systems. And a reminiscence of this piece of ancient history has filtered through into our own Bible, together with the Flood, the dispersion of races, and other related facts.

But the sacred allegories have more than one interpretation, and the symbol of the lightning-struck tower has also a reference to the drama of the human Soul. It means that whenever the selfish and ambitious try to erect a kingdom of power upon a basis of materialism and selfish force, it is struck down, sooner or later, by lightning from above, and confusion results.

E.

Dolmen de Crucuno

THIS dolmen, called locally "La Roche aux Fées," is the largest dolmen in the Morbihan, that Department of Brittany in most parts of which prehistoric remains are as frequent as are the buildings of today.

It was formerly used as a barn, but is now, like all the important megalithic monuments of the country, the property of the State. The ownership is shown by the stone pillar.

The part preserved is 24 feet in length, and 12 feet in breadth, with an interior height of 6 feet. The principal capstone measures 17 feet by 12 feet 6 inches, and is from 2 to 3 feet in thickness; it is supported by 10 large upright menhirs.

The Trend of Twentieth Century Science

The Breathing of the Globe

A CHEMIST has been attempting to estimate the breathing of the globe, considered as a home of living beings, in terms of carbonic acid gas. Taking a rough estimate of the human population, it appears that as a family whole we breathe 90,000 tons of this gas daily into the air. If the air contained none, and there were no other sources of contribution, it would take 71,000 years before the present amount was reached; that is to say, we are competent to double the present amount in 71,000 years.

But that leaves out two great factors. He calculates that in burning coal (and presumably wood and oil) we contribute 76 tons of the gas per second to the air; which, in a day comes to 6,566,400 tons; and this is about 73 times as much as the respiratory contribution. By this means we could therefore double the present amount in less than one thousand years. The respiration of animals would make the period still shorter. Now since we do breathe and the animals breathe and coal is burned, how is it that the carbonic acid in the air hardly increases?

Because of two factors, the work of the plants, and of the sea. To the plants the carbonic acid is a food.

When a tube, half full of water, contains also some gases, those gases diffuse themselves throughout the whole tube as if no water were there. The water is said to have dissolved that much of them which is diffused through it. Add more of any one gas to the tube and the water takes up more, or more enters the water.

The great oceans therefore contain immense quantities of carbonic acid gas in solution, and the more that is poured into the air the more they take. But they take a further lot into actual combination with their saline contents, giving rise to carbonates.

And the rest of the balance is effected by the plants. STUDENT

Variation and Mutation

THE view of de Vries that evolution takes place by mutation and not by variation is in some degree under trial at the hands of the Carnegie Desert Laboratory.

As, in the progress of geological time, the waters of any region gradually dried up and the rainfall sank to the desert measure, the plants had to accommodate themselves to the new conditions. Those which could not do so died out. The others made arrangements for living with a minimum of moisture, for checking evaporation, for storage, for collecting every drop that fell in their neighborhood, for condensing dew. In time their form became greatly changed.

What will they do when they are gradually brought back, experimentally, to the original conditions, to regions where there is plenty of water? Will they, little by little, resume their original form?

Variations are of two kinds: mutants, and those that arise as adaptations to new conditions. It is usually only possible to tell one from another by the permanency of the for-

mer and their absence of obvious relation to surroundings; and by the impermanency of the latter when the conditions that caused them are altered. The former are definite steps in evolution and correspond to deep changes in the life of the plant. The latter are not necessarily a step *upward*, a step in further complexity, a step in evolution.

All the time that these desert plants were varying to suit the new conditions, they were also producing mutants. When the old conditions have been reproduced for them, it may be presumed that all the variations of mere adaptation will disappear and that we shall be able to see what amount of mutation has appeared. The experiment is of great interest.

STUDENT

Fixation of Nitrogen

SOME recent experiments in Hungary have confirmed the discovery of an English botanist, Jamieson, that plants are not limited to the work of their roots for the fixation of nitrogen. They do it also by their leaves and stem. Perhaps all do so. Jamieson regards it as of very general occurrence and it was proved in Hungary for many species of trees.

The agent is minute hairs. They take the gas direct, subject it to various combinations and finally make albumen from it. They then wither and are absorbed along with their contents into the body of the plant. By suitable methods of staining and microscopic examination the transit of the albumen could be observed. Successive crops of hairs maintain the supply.

It remains now to ascertain whether the hairs are actually an integral part of the plant or an adventitious organism "symbiotically" working with it as the nitrogen-fixing bacteria work with the leguminosae at their roots. In "symbiosis" one living creature works in intimate association with another, each being profitable to the other and often seeming to be one organism with it. STUDENT

Reincarnation Among the Plants

AS everybody knows, plants reproduce themselves from one end or the other; from the top by seeds, from below by shoots from rhizomes. A rhizome is a stem growing sideways underground instead of upwards into the light, and it provides itself with its own roots. It is then capable of self-support and its junction with the parent may be cut. Its length may be so great that the shoots it sends up may appear to be independent seedlings from seeds scattered to some distance. This latter mode of reproduction appears to require less energy than that by seeds. At any rate it occurs where seeds cannot be formed.

The Botanist and Director of the Pic du Midi Observatory in the Pyrenees have been studying the plants obtaining in that zone of the mountains which is always clothed with cloud, between about 4000 and 6000 feet of altitude. There are some plants that will not grow in this belt at all, existing above and below it. Others, with the usual plant liking

for sunlight, have here modified themselves so as to do without it.

The flora of these cloud covered pastures is poor in species; the flowers, owing to lack of sunlight, seldom appear. Here we have a very clear case of adaptation; the plants of the lower regions, and certain Alpine plants which, in their normal habitat, flower and reproduce by seeds, propagate, in the zone in question, by rhizomes, and the creeping forms assume an unusual development.

A seed is, or embodies, a separate plant individual often varying greatly from the parent or parents. The variation may be marked and permanent, the appearance in fact of a new species. But a shoot or sucker from a rhizome is only an extension of the old individual and does not vary from it. If it flowers, its flower is like that of the parent. And it is evidently produced with much less expenditure of force and with less absorption of sun force than seeds. The latter, though also coming from the substance of the parent, separate from it so completely as to allow of the reincarnation of a new plant monad with a past of its own, which in its subsequent development may definitely modify its outer form.

STUDENT

Tempered Copper

AN art "that was old when the Pyramids were building," says the *Technical World Magazine*, the art of tempering copper, has, it seems, actually been rediscovered. The fortunate man is a Denver jeweler, who, supposing he was adding borax to some copper, added something else and found his metal tempered. Then he analysed his something else and patented his process. On the large scale, the copper as wire is wound off one great wheel on to another. On its journey it is made red hot and in that state traverses a compartment in which the something else is present, which it absorbs as sugar does water. When cold on the second wheel it is found to be tempered, its life being tripled and its tensile strength greatly increased. Analysed microscopically at Cornell University, it was found that the set of the molecules and crystals had undergone a complete change.

The modern question of course is: Can bayonets be pointed with it, guns lined with it, or torpedoes nosed with it? STUDENT

The Top of our Ocean

AN international agreement, active since 1900, provides that the chief European meteorological stations shall send up an unmanned exploring balloon once a month. Comity has gone that far anyhow. These ambassadors carry the necessary instruments for the registration of pressure, height, temperature, and humidity. Towards the end of last year one of them managed eighteen miles, the highest point yet. At eight miles the minimum temperature was 94° F. below zero. For the remaining ten miles the temperature slowly rose, finally becoming 80° below zero, the barometric pressure being but two-fifths of an inch and the humidity a quarter of that at the earth's surface. The wind was very swift, the balloon making 50 miles in 113 minutes. The rise is certainly a mystery. STUDENT

Studies

Aden and the Suez Canal

THE peninsula of Aden is a mass of barren volcanic rocks, and the site of the town is probably the crater of an extinct volcano. The opening of the Suez Canal revived the commercial prosperity of Aden, after it had fallen to a low ebb in consequence of the Cape of Good Hope route to the East.

Lesseps' great achievement continues to play a rôle of ever-increasing importance in the history of the world. Since the Canal was first opened, operations for maintaining and deepening it have been in progress, and in many other ways it is being improved. Port Said is now the terminus of a railroad running to Cairo, which gives it increased importance as a port in connexion with the Canal.

The widening of the Suez Canal is described by the English correspondent of the *Scientific American*. Operations have to be continually carried on to accommodate the increasing size of vessels. When opened in 1869 the canal was from 150 to 300 feet wide at the water level, 72 feet at the bottom, and 26 feet deep. In 1901 an appropriation for doubling the size in its entire length was made, and it is anticipated that the work will be completed within the next four or five years.

The danger of silting up by sand from the Arabian Desert is great; the amount of material excavated from the canal in 1906 was nearly two million cubic yards, exclusive of about a million and a half dredged from Port Said in the same year. In 1904 a minimum depth of 28 feet for the whole distance was maintained, and twelve new gares or places where vessels may pass each other were made. Arrangements were also completed for deepening the canal to 34½ feet, which will be accomplished within the next five years.

The material above water level is removed by manual labor, terraces being cut in the banks along which temporary railroads are laid. Beneath the water the soil is removed by dredgers which discharge their loads either upon the banks or into lighters.

The canal is not infrequently blocked by the stranding of vessels. In 1905 such accidents averaged 1.7 per cent of the vessels passing through, and in 1885 it was 4.3 per cent. In 1905 the *Chatham* foundered by collision with another vessel and sank in the

Lomaland Photo. and Engraving Dept.

RESTING-PLACE FOR CARAVANS AND TRAVELERS, ADEN

center of the channel, tying up all navigation for several days. Within four days the authorities had to handle 109 vessels which had been delayed. The wreck was blown up and the debris salvaged.

Besides the deepening of the canal, many other improvements have been made, especially docking facilities in connexion with the Cairo and Port Said railway; and modern sanitary and hygienic improvements have been introduced for the benefit of the native workmen.

Value of Radium

RADIUM bromide costs about £7 a milligram, which would be over £200,000 for an ounce avoirdupois. Another account gives \$100 a milligram as the price of the metal, but there is no real market value.

The late Professor Curie, while lecturing one day, dropped a tube containing a few grains of radium. The room was instantly cleared and every particle of dust collected with the utmost care; this was taken to the laboratory and recrystallized, the precious substance being recovered with only an infinitesimal loss. The supply of pitchblende, from which radium is obtained, is practically limited to Austria, where the government has an embargo against its exportation. The center of the industry is on the southern slopes of the Erzgebirge in Bohemia. In 1906 the production of uranium ore from here was 16 metric tons, representing a value of about \$55,000; about 14

tons of uranium salts were extracted from this. The geological formation is mica schist enclosed in masses of granitic rock; and other ores, such as silver and bismuth, are found. The operations which are to be begun in Cornwall will probably reduce the price.

Half a century ago the miners of Cornwall, England, found quantities of uranium ore, which they sent to the smelters as "black copper." It was returned to them as rubbish, and now some 40,000 tons of ore, containing perhaps 10 per cent of pitchblende worth about \$2.50 a pound, has been found dumped at the head of a mine near St. Ives.

Tamed Raven Killed by Wild Ravens

THE following account appears in *The Scotsman* of the way wild birds sometimes treat their domesticated brethren. A man owned a raven which had been captured from a craggy ledge in its infancy. At first it was wild and would kill birds and even rabbits which ventured into its pen. But eventually it became tame and mild and would allow robins to pick crumbs near it. One day it was terrorized by the approach of three wild ravens, which sailed round its pen crying angrily. The reason of its fear was explained by a neighbor who had also kept a tame raven. This second bird was allowed to wander at large; but one day five wild ravens appeared. They circled round their degenerate brother, then suddenly swooped down and killed him, after which they sailed away home. H.

Scientific Theosophy

(A Lecture delivered at Isis Theater—I)

ONE may sometimes hear it said, by people who call themselves Theosophists but do not belong to the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY, that the latter is a purely philanthropic movement and has no teachings that appeal to the intellect. These people seek to make out that they themselves, or the body to which they belong, are the custodians of all the scientific and intellectual teachings in Theosophy. Their policy is to bestow on the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY a friendly pat on the back, to say that it is all very well in its way, but anybody who is interested in the science of Theosophy must come to them.

This is an ingenious perversion of the facts, as will be shown.

The UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY is just publishing a new edition of *The Secret Doctrine*, as Madame Blavatsky wrote it, two large volumes of some 1500 pages, an exhaustless mine of information on all branches of Occult Science. The last third of each volume is given specially to a consideration of the relation between modern science and Occult Science, and the views of physicists, chemists, biologists, anthropologists, astronomers, etc., etc., are elaborately considered and compared with those of Occultism. These, together with other teachings of H. P. Blavatsky, both public and private, are studied by students at Point Loma, and H. P. Blavatsky's public writings are published and accessible to anybody. Those who read the columns of our weekly magazine, the CENTURY PATH, must know that scientific questions form a very large part of its contents. Not only is there ample opportunity for inquirers to study this aspect of Theosophy, but they are urged to do so.

H. P. Blavatsky's teachings, however, were not given with a view to satisfy mere curiosity or to confer personal powers on individuals for the gratification of their pride. They were given to help humanity along the path of real progress, to promote man's real interests and happiness, to save him from the consequences of materialism and selfishness.

But of true Occult teachings, appealing in the highest degree to the intellect, there is, as said, a boundless ocean. Those of H. P. Blavatsky's pupils who appealed to her for fuller instruction in Occultism were invited by her to join an inner body, and from the members of this inner body was exacted a pledge of unselfish devotion to the Theosophical Cause as a prime and indispensable condition of their acceptance as pupils. Those who remained faithful to this pledge, and have devoted themselves unceasingly to the interests of the Theosophical Cause, have been able to profit by the

instructions; but those who failed to fulfil their obligations have wandered off into by-paths of astralism, spiritism, or some other unprofitable pursuit.

Some people would perhaps like that the lecturers from Point Loma should stand on this platform and deliver interesting disquisitions on the human aura and its various layers and colors; on thought-forms and how to develop the astral senses so as to be able to see them; how to climb out in your astral body and pay astral visits to other people; how to fix up your vibrations so as to secure good health and a sense of well-being; and so on.

But it is evident that the work at Point Loma does not proceed on that plan. Otherwise nothing would be easier than to write and deliver such lectures and to charge money for them; and doubtless Mrs. Tingley and her students could make a very good business out of it. But this would not be Theosophy. Mrs. Tingley is the successor to Madame Blavatsky, bound to carry out the Founder's objects, and indeed being identified whole-heartedly therewith, and her students are many of them pledged disciples of Madame Blavatsky or the two other Leaders, William Q. Judge, and Katherine Tingley, and all identified with the same purposes. Those purposes are sufficiently well understood to be the regeneration of human society and the spreading of true wisdom and self-knowledge.

If a plain answer is to be given to a plain question, it is no use mincing matters and beating about the bush, and it may as well be stated flat-footedly at once that Theosophy has no message for people who propose to use its services and teachings as means to their own private ends; no message for them, except to tell them that they will live to find out their mistake.

But for all who are really interested in human nature and in the many great and interesting problems connected therewith, Theosophy has a message. Those who are in touch with current thought know that it is a pretty general opinion that the world today does not need any more teachings that only gratify idle curiosity and pride, but that what it wants is self-knowledge and self-discipline. The great problems that interest the Theosophist are how to restore the balance of human life and stop the alarming growth of inebriety, drug-taking, insanity, etc.; how to cope with the numerous social evils; how to make humanity truly happy and prosperous. No one with a really social temperament can be satisfied with feathering his own nest, but must have at heart the welfare of the community whose joys and sorrows he shares.

Scientific Theosophy includes a study of the nature of Man and his various principles, information as to which must be sought in the Manuals. We have the physical body, composed of innumerable living atoms, each of which is a separate life; yet the atoms are organized into groups forming larger functions, and these again into larger groups forming the bodily organs, and so on until we get to the master-life of the whole body. The physical body is molded on the astral body, composed of a finer kind of matter, wherein are located the senses; it separates partially from the body during sleep and can be projected to a distance by an adept. There is the Kâma or desire principle, the Manas or mind, dual in

its nature, the Buddhi or Spiritual Soul, and so on.

All of these things are studied by the Theosophists at Point Loma; but, instead of being studied out of a book in a dry categorical sort of way, they are studied practically, as in a laboratory, in connexion with human life; thus they do not remain a curious bypath of study, but become of practical service in life—a circumstance that must surely commend itself to all people interested in the great questions of life and not content with merely accumulating curious information.

There are good reasons why we do not stand upon this platform and give out information about occult matters. One is that the purpose of the Theosophists at Point Loma does not consist in attracting a lot of dabblers in so-called magic or a lot of people interested in their own personal concerns; what the Theosophists want is *workers*. Another reason is, that if such knowledge is to be useful and not harmful to people, it must be given under test; wherefore people are first offered the opportunity to prove their willingness to make the cause of human progress their first aim.

Many of the Theosophists are old pupils of H. P. Blavatsky and the other two Leaders of the Theosophical Society, William Q. Judge, and Katherine Tingley; and they have discovered that mere dabbling in such research is not worth while. They have found something much better than that. They have learned a good deal, and it has been by devoting themselves unselfishly to the work; they can only invite other people to tread the same path and warn them from treading the wrong.

The attempt to represent the members of the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY as a set of unintelligent amiable philanthropists, while the self-styled Theosophists of various cults are the intelligent and intellectual ones, is supremely absurd. The members of the U. B. and T. S. are not wanting in brains and many of them are keenly intellectual. But this is all the more reason why they should not care to remain *dabbling* in dreary twaddle about auras and astral bodies and spooks. They prefer to apply their brains to some purpose.

Still we must not forget that such subjects often serve as the first introduction which people have to the idea that there is such a thing as occultism, that there are inner planes in nature, and higher powers in man. But then Theosophy can tell people far more about those subjects than the psychic cults can; for the psychic cults are limited to a certain range by the fact that their aims are so narrow. Instead of seeking to develop the spiritual powers of man's nature, which can only be done by broad-minded unselfish work, they are interested only in the lower psychic faculties.

It is not this kind of knowledge that can stop poverty and crime, inebriety and insanity, famine and war and disease. And when people get a notion of psychic powers, what do they do? Do we not find that they frequently fall victims to their lusts and passions, thus bringing occultism, Theosophy, or any name they may use, into disrepute? Do you think it would be a desirable thing to turn hypnotism, astral vision, and other such things loose in the world? Would it not initiate a veritable reign of terror, against which the law would be powerless?

H. T. EDGE

THE BLACKBIRD (Y Fwyalchen)

THERE'S a spirit that's haunting the Welsh land,
There's a glamor aglow in the trees;
It's the Blackbird of Cinwc-y-dinta',
In the woods within sound of the seas.
He's a bard, and he's chanting his story,
And it's wild with the Breath and the Flame;
And he sings for the world and its glory,
With no desire on him for fame.

'Deed, I've heard the lone nightingale mourning
Sad songs down her passionate vales;
But I'd rather the music of dawning
From the little black ouzel of Wales.
He never made mention of passion,
He has no word for sorrow at all;
But he sings out God's joy in his fashion,
And I'll hail him, best bard of them all.

He never took gold for his singing,
Nor crown nor reward for his song;
Yet the halls of the greenwood are ringing
With his wild, woodland Welsh all day long.
O voice from the morning and childhood,
O poet of the green leaves and dew,
The Gorsedd of Wings in the wildwood
Had never an equal for you!

As for creed of him, lo, there's the sea-wind!
As for church, there's the blue, gleaming air;
'Tis not he would be vexing his wee mind
With sin, and forgiveness, and prayer.
But the glamorous soul of our Welsh land,
And its laughter borne down from above—
You shall hear them in Cinwc-y-dinta',
From the yellow-billed bard that I love.

Welsh Song, translated by K. M.

THEOSOPHICAL FORUM

Conducted by J. H. Fussell

Question I should be glad to learn in what essential points the Theosophical teachings concerning the Sun differ or supplement the theories of modern science, especially in regard to its heat.

Answer Until lately there were only two hypotheses put forward by science to explain the continuance of the solar heat. One was the contraction theory of Helmholtz: this assumes that the sun is shrinking, and thereby, upon the analogy of well-known laws of *terrestrial* physics, producing enough heat to supply the solar system for several million years. The other was the theory of impact, i. e., that a continuous rain of meteorites falling upon the sun produces the required heat by friction. Neither hypothesis has any foundation in facts yet observed, and the latter is becoming discredited because of the growing opinion that most of the meteorites travel in regular orbits around the sun—are part of the solar system—and are not distributed indiscriminately in space to any considerable degree.

The difficulty in settling the question may be inferred from the extraordinary disagreements between the results of careful experiments in testing the actual temperature of the sun, from the days of Newton until now. They range from 1440° to 9,000,000° Cent.! The most recent is 3500°, derived from the study of the vaporizing of titanium, an element common in the sun; but as so little is actually known of the amount of atmospheric pressure on the sun's surface—a vital factor—it is generally admitted that we must await further information before accepting any solution of the problem.

According to Theosophy the sun resembles—in fact it is—the heart and lungs of an organism, circulating vital energy throughout its limbs, the planets, and receiving it back to be purified and again sent forth. The recent scientific discovery that the sun rhythmically contracts and expands several hundred miles in its polar and equatorial diameters synchronously with the sunspot period is a confirmatory fact of great interest to students of Theosophy. In an early number of one of H. P. Blavatsky's Theosophical magazines there is a long article upon the sun by one of her Teachers, in which the following occurs:

The sun is not a cooling mass. He is quite as self-dependent as he is self-luminous; and for the maintenance of his heat requires no help, no foreign accession of vital energy; for he is the heart of his system, a heart that will not cease throbbing until its hour of rest shall come.

The same authority also says that the sun is not in combustion in the ordinary sense, though it is *glowing*, and is the seat of intense vital, electric and magnetic activities. In the filament of an incandescent electric lamp we see an example of glow without oxidation or combustion, and the most recent spectroscopic observations prove that the sunspots are the localities of terrific electro-magnetic vortices.

The discovery of radium and its transmutation into helium has given unsuspected support to the Theosophical teaching that the sun's active life will be far longer than materialistic science has hitherto been inclined to admit. Radium is supposed to exist in the sun by reason of the presence of helium. It gives off heat without undergoing combustion or oxidation, and this entirely unsuspected and anomalous factor in the problem has greatly modified scientific opinion as to the duration of the sun's effective life, indefinitely increasing it without calling in the aid of the hypothetical meteors. In fact astro-physics now practically grants as much time in the past and future as any possible theory could desire.

All the most recent discoveries of science are tending to prove that blind chance does not reign and that intelligent spiritual laws are behind the visible forms of nature. Theosophy has always taught, from time immemorial, that high Intelligences, spiritual Beings, guide the action of the physical forces and preserve the universe from chaos. In the words of Patanjali, the ancient Indian philosopher, "The Universe, including the visible and the invisible . . . exists for the soul's experience and emancipation." The sun will not freeze, nor the earth melt with fervent heat, nor the heavens roll up like a scroll until the time has come for their life to pass on into other states of existence in the endless chain of progress.

STUDENT

Question How can Theosophy be made practical?

Answer II. When this question is asked, as it often is, in all sincerity, "How can Theosophy be made practical?" one is surprised at first, and tempted to reply merely: By making it so. Here is the Path; walk in it. How can I walk in it? some one asks; and one can only say, By walking therein, by ceasing to walk in other paths.

But after all this does not satisfy, and we

can look at the question in another light, though in the end we shall, I think, find ourselves coming back to the same laconic answer as the only one; for if there is any knowledge of Theosophy, surely the only thing needed to make it practical is, first, some recognition of its truth—and that indeed may be taken for granted in this case, as we assume that the question is asked in sincerity—and then the *Will* to act according to that knowledge.

It is a sad comment however on our human nature, that the human mind is so constituted, or has acquired such habits, that it rarely likes to go straight ahead to the object of its search along the lines of least resistance, but prefers wandering along winding and devious ways.

What is Theosophy? Divine Wisdom, knowledge about man and Nature, their origin, nature and destiny. But is it not a mistake to consider Theosophy a body of doctrine only? Theosophy is a life. "Theosophist is who Theosophy does."

But as a body of doctrine, what are the main teachings? Let us enumerate some of them: Brotherhood, Karma, Reincarnation, the essential Divinity of man, the Duality of human nature. This enumeration is sufficient for the purpose of illustration.

How can we make Brotherhood practical? Surely by being brotherly, by doing unto others as we would have them do unto us. You have the knowledge: then act upon it. Can that be Brotherhood which is not practical?

How can we make our knowledge (or belief if you will, if it be merely so for you) in Karma and Reincarnation, practical? Is it not by reliance on the Law; by the cheerful performance of whatever duty lies before us; by doing our best in the circumstances in which we find ourselves; by accepting the lessons and the trials of life with an even mind—knowing, yes, *knowing* that these lessons and trials are our due and also our opportunity; knowing also that whatever seed we plant now, will bear its harvest in the future, either in this or some other incarnation here on earth, and by seeing to it that the seed we plant of thought and act shall be good seed?

How can we make our knowledge of the Divinity and the Duality of our nature, practical? Surely by holding to the Divine, the higher side of our nature, by cultivating all the nobler impulses of compassion, purity, rectitude, and refusing to give way to the lower impulses which are the contrary of these.

How then can we make Theosophy practical? Katherine Tingley has said: "The knowledge that we are Divine gives the power to overcome all obstacles and to dare to do right." We need but to make a beginning to know that it is possible to make Theosophy practical and a living power in our daily life; and once we make a beginning, once we make the first effort, we know that it depends upon ourselves to decide whether we will thereafter be men or puppets.

To begin to make Theosophy practical needs but a little knowledge of its teachings and the *Will* to put them in operation.

It is a call to work for the race and not for self, a request to bring to the west and the east the doctrines that have most effect on human conduct, on the relations of man to man, and hence the greatest possibility of forming at last a true Universal Brotherhood.

STUDENT

THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY

FOUNDED AT NEW YORK CITY IN 1875 BY H. P. BLAVATSKY, WILLIAM Q. JUDGE AND OTHERS
REORGANIZED IN 1898 BY KATHERINE TINGLEY

C e n t r a l O f f i c e P o i n t L o m a C a l i f o r n i a

The Headquarters of the Society at Point Loma with the buildings and grounds, are no "Community" "Settlement" or "Colony." They form no experiment in Socialism, Communism, or anything of similar nature, but are the Central Executive Office of an international organization where the business of the same is carried on, and where the teachings of Theosophy are being demonstrated. Midway 'twixt East and West, where the rising Sun of Progress and Enlightenment shall one day stand at full meridian, the Headquarters of the Society unite the philosophic Orient with the practical West

True Mysticism

WHAT is mysticism? It may perhaps be described as belief resting on other than reasoned grounds; the dictionary defines it as "obscurity of doctrine." Religious convictions rest largely on such grounds; and with some temperaments they rest almost entirely thereon. It is useless to approach such natures through reasoning and argument; any logical difficulties in the way of belief only give greater scope for the exercise of their faith.

But are they deluded? Not necessarily; for the work-a-day mind is not the sole channel through which we may become convinced of truth. A nature which has more of this native perception than of reasoning power will believe without being able to give grounds for its belief; and to shake that belief you must use something other than argument.

But these natures can be deluded; and they often are deluded. Look around you and you will find that large numbers are counted among the staunch adherents of powerful dogmatic religious establishments. Their peculiar quality of devotion and simple faith are recognized by the ecclesiastical powers, who well know how to appeal to such people. This explains why such systems, in spite of their illogicality, have so many adherents.

How can we reach these people and rescue them from their infatuation for a false mysticism? The answer is, by showing them the true mysticism. Why cannot other influences in the world affect these devotees? Because these other influences do not know how to appeal to them—have nothing to give them in return. A mystical adherent of the Latin church will not go into Protestantism, because that lacks the element he requires; it is not devotional or sentimental enough; nor does a freedom-loving Protestant often enter the Latin church. Modern science cannot attract a mystical nature; it ignores, when it does not deny, the things that form his chief food.

The Latin church has a whole machinery of mysticism—its Virgin, its saints, its purgatory, and a great deal more. It has its ceremonies and devotional exercises. It makes a certain appeal to faith, devotion, and piety. Consequently it attracts into its fold and keeps there a number of devout enthusiastic natures, and the world is the poorer for their loss. People who live in a dark world may be ex-

MEMBERSHIP

In the Universal Brotherhood and Theosophical Society may be either "at large" or in a local Branch. Adhesion to the principle of Universal Brotherhood is the only prerequisite to membership. The Organization represents no particular creed; it is entirely unsectarian, and includes professors of all faiths, only exacting from each member that large toleration of the beliefs of others which he desires them to exhibit towards his own.

Applications for membership in a Branch should be addressed to the local Director; for membership "at large" to G. de Purucker, Membership Secretary, International Theosophical Headquarters, Point Loma, California.

cused for falling in love with the moon; for the moon does give a glow and has its beauty. But what of the sun? Could these devotees know that their devotion is misplaced and that they are being fed on shadows, in grasping at which they drop the substance, they would free themselves.

It is long since the light of true Wisdom faded out from the western world and was replaced by superficial religions which have acted like the deceiving moonlight during the night of ignorance. But that true light is beginning to dawn again. Indeed, within that very church we see ardent souls, weary with following illusions, and insisting on infusing truth and freedom into their religion. May their aspirations be rewarded! They are beginning to realize that every man is Divine, and that the Divine Ray from within can be evoked to shine through the clouds and illuminate the understanding; and that it does not require the interference of a whole hierarchy of prelates to do this. They are waking up to the fact that the religion they follow is managed by rules and conditions that are more in the interests of temporal expediency than of spiritual benefits. And they are protesting. More power to their protests!

Theosophy has for these people the message that religions need regenerating and that they can be regenerated. It is not necessary to pull down religion and rush into scepticism; but it is necessary to rescue religion and make it our own. The faith and devotion which inspire us are the gifts of the All-Father to man; and no power on earth has the right to take advantage of these noble instincts and use the devotion as a means of drawing power to itself. Such influences have been compared by sacred writers to a beautiful but unprincipled woman who attracts the devotion of her lovers and who uses it to her own glorification and to their ruin.

The many noble people in the churches are not the object of these remarks; nor indeed

is any individual; but it cannot be denied that there is such an influence as that suggested, whoever may be responsible for it. This influence, whether it be enshrined in a church or in any other guise, is hostile to humanity's interests; and it should be eradicated from religion or from whatever else it may have associated itself with.

Theosophy would show religious people the truth about their religion, and help them to discover the errors they have fallen into. It would assure them that there is scope for faith and devotion outside of ecclesiastical dogmas. It would reveal to them the true mysticism, of which ecclesiastical systems are the unhealthy counterfeits, like a fungus that is a spurious form of vegetation. That which has been lost is so much greater and holier than that which has followed it. May the Sun dawn again!

A mystic is one who believes in the reality of a world beyond the senses, who feels the touch of an inner life that is better than his outer living. Theosophy teaches man to seek the light within his own Soul, and the church has often shown itself bitterly hostile to Theosophy.

E. T.

"Manvantaric impulse commences with the re-awakening of Cosmic Ideation concurrently with . . . the primary emergence of Cosmic Substance . . . from its undifferentiated *pralaya* state. Then, absolute wisdom mirrors itself in its Ideation; which, by a transcendental process . . . results in Cosmic Energy (*Fohat*). Thrilling through the bosom of inert Substance, *Fohat* impels it to activity, and guides its primary differentiations on all the Seven planes of Cosmic Consciousness. There are thus *Seven Protyles* (as they are now called), while Aryan antiquity called them the Seven *Prakriti*, or Natures, serving, severally, as the *relatively* homogeneous basis, which in the course of the increasing heterogeneity . . . differentiate into the marvelous complexity presented by phenomena on the planes of perception. The term "relatively" is used designedly, because the very existence of such a process, resulting in the primary segregations of undifferentiated Cosmic Substance into its septenary bases of evolution, compels us to regard the *protyle* of each plane as only a *mediate* phase assumed by Substance in its passage from abstract, into full objectivity."

THE THEOSOPHICAL ADDRESS AT ISIS THEATER

LAST evening Dr. Herbert Coryn, one of the members of the literary staff of the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY, gave a most instructive and uplifting address on "The Place of Literature in Life," at the Isis Theater.

The speaker commenced by drawing a clear distinction between feeling and intellect, and illustrated it by putting into dry prose the literal meaning of Tennyson's *Ring out Wild Bells*, and comparing the effect with the glow of feeling aroused by the actual words of the poem. He showed that the form of literature which alone deserves the name occupies a place somewhere between the two extremes of music, which is pure feeling, and geometry, which is pure intellect. To quote from the address:

"Poetry is literature which lies nearer the feeling end than the intellectual end. In order to convey the weight of feeling the words are specially chosen and arranged. Some words, even standing alone, carry a great weight of feeling; for example, moan, empurpled, immemorial. Others get their weight from their combination.

"Literature, then, is writing that places us in relation not only with the thoughts or conceptions of the writer, but with his feeling, with the very quality of his inner life. It is thought made to vibrate with the music of feeling. Our own life has been made richer by some of his; yet his is the richer for the expression. Literature is a substitute for something better and quicker that may some day come. Imagine a time when the souls of all humanity are open, when every thrill in response to beauty felt by anyone, when every height of feeling reached by anyone is at once felt and reached by the rest; when one luminous ether of feeling bathes us all, all of us contributing to it, all of us receiving from it. What need then of writing literature?

"Most of us look quite unseeingly at our commonplace neighbors. But now Dickens and Chaucer and William de Morgan look at them and enter into their feelings and so write what they see that those lives of commonplace feeling communicate into our feeling, and we smile and understand and sympathize and are eternally the richer. A great novelist has something of the all-understanding quality of that eternal consciousness which looks on at and sustains the universe. If we could press the grand conceptions of the chemist far enough, feeling ever expanding with the expanding framework, and if we could press the understanding sympathy of the great novelist far enough, we should find that we had two paths to that Eternal Consciousness. Any piece of great literature is a gate to some one of the many paths to the Eternal. . . .

"Through it all we grow into fuller and fuller touch with the greatest, noblest, most perfect feeling of those who have felt most and greatest and noblest. Through it all we approach the time when all human feeling will be such as now we touch only in our highest and rarest moments; when no unworthy feeling shall stain the soul of any man, and when literature itself will become needless because all men's feelings will pulse out into that general ether of light by which we shall each touch the souls and share the life of all the rest."—San Diego Union

Some Misapplications of Science

TO collect a few instances of misapplications of science does not of course amount to a condemnation; but, all the same, the cases given below are largely typical, and indicate how the pursuit of knowledge, unless sufficiently controlled by a sound philosophy, may lead elsewhere than to the advancement of the human race. Too much machinery means the externalizing of human powers, so that what used to be accomplished by the man himself is now largely accomplished by machinery and chemicals. But science is beginning to realize that it has gone far enough that way and must now turn its attention to the study of man himself, and how to develop the moral muscles and the machinery of the character.

A Cambridge professor is reported to have declared in a lecture in London that human flesh is the best food there is for human beings; and to have reached this conclusion by experiments in which dogs were fed on dog-meat, and reached the maximum of endurance on that diet.

This statement has been reduced by a commentator to the aphorism, "science justifies cannibalism"; and it certainly shows that a certain kind of reasoning may lead to conclusions against which we rebel. The question arises as to how far we are justified in rebelling; ought we to suppress our rebellious feelings in deference to the voice of this "science," or ought we to suspect the science of being at fault? The great majority of people will take the position that cannibalism is wrong, and therefore any reasoning which justifies it must be wrong. And in support of their position they will be able plausibly to allege that scientists have not yet proved themselves sufficiently infallible to be accepted as absolute authorities in such a case. They will have a sneaking suspicion that some other professor (from Oxford, perhaps) will say tomorrow that human flesh is the most deadly poison, basing his conclusions on the results of feeding cows on beef; and they will reserve their judgment accordingly.

In fact the above reasoning will not bear examination. It assumes a significant analogy between the dog and the man, to which we can give but a limited assent. In order for the analogy between man and dog to be significant for the purpose in view, it would be necessary to suppose that the man aspires to canine ideals in the matter of habits. Granted that our professor is looking forward to a life of running about in search of strong and nauseous smells, burying bones, chasing cats, and so on, we may allow his analogy of the dog to be in point; for any other kind of man it is apt to be misleading. Some, perhaps, would prefer to model their lives after the pig or the ox. It may well be that a dog acquires the maximum of athletic ability after a diet of dog, but is that any reason why a man, desiring to become athletic, should eat man? It might as well be inferred that he should eat dog's flesh. The best we can make of the argument is this: a dog which eats dog's flesh becomes a strong dog; therefore a man who eats dog's flesh will also become a strong dog. But even that argument seems weak.

But, leaving aside the argument from dogs,

let us suppose that a man has actually eaten human flesh himself and found that he gained a certain kind of strength therefrom. Is cannibalism therefore justified? We cannot tell until we have tried the effect on a whole race for a considerable period of time. And who can doubt but that a race fed on human flesh would degenerate rapidly and horribly in many ways, even though it might gain a certain kind of strength comparable to that of the tiger? The same line of argument would lead to drinking human blood and other practices better imagined than described.

There are foods which stimulate the animal nature and foods which nourish the whole nature. There is no sharp line between the two, but there is a vast gulf between the two extremes. We must choose whether we will advance along the line of purity and healthfulness in diet, or of grossness and animalism; whether we mean to feed ourselves on injections and stimulants or eat the fruits of nature; whether we want to copy the animals, and, if so, which animals. And we must distrust arguments so ill-founded as some of those put forward.

A secret invention is described as enabling a warship to train and fire a whole broadside by electric control from the conning-tower and without the aid of a single gunner.

Here is a case where science, by inventing new means both of offense and defense, complicates matters greatly and adds huge burdens to the shoulders of nations. But a man will be needed to press that button; and what follows, together with similar things that all have read about, indicates that the man may not be forthcoming.

During the war in South Africa it was found necessary to send back 3000 British soldiers who were unable to bear the rigors of the campaign, solely on account of the condition of their teeth, which were unable to chew the "bully" beef and hardtack.

The functions of the mouth are largely replaced by the machinery of the mill and the kitchen, so that we place in our mouths food that is already fit for swallowing; hence the teeth go out of business. The predigestion fad is even worse in its auguries for the future; for may it not in the same way eliminate the stomach from the number of organs essential for the assimilation of food? Shall we not, perhaps, have soldiers unable to digest ordinary food and requiring machine-made chyle for their sustenance?

We may well pay attention to improving physique, since we do so much to undermine it by our luxurious inventions. Take the following as an instance:

An electric stove for the breakfast table is a recent invention, by which one can cook one's muffins, toast, etc., without getting up, and transfer them direct from the griddle to the stomach.

After all, why get up in the morning at all? Why not press a button and turn over and go to sleep again, leaving the machinery to live your life for you?

If we taught ourselves how to do without hot buttered muffins, we should be more independent, and need not go to the expense of carrying electric cooking stoves into battle for our toothless soldiers.

STUDENT

Drake's Drum

A WRITER in the London *Globe*, whose whose naval sketches are always interesting, relates the story of Drake's Drum. This old relic still exists, and to the Westcountryman is one of those things held sacred in silence, as are so many ancient landmarks among those who avail themselves of modern veneer to hide the more effectually their heart of hearts.

The legend runs that when England is in peril of invasion, one tap on Drake's drum will bring back the soul of her great Admiral to be "reincarnated once again to vanquish England's enemies." And they add that twice has the drum been sounded. The first time was when Blake avenged the daring of the Dutch, and the second was the signal for Nelson to lead to victory the ships of the Royal Navy, "upon which, under the good Providence of God, the wealth, strength, and safety of the Kingdom do chiefly depend," as (if memory serves) the quaint wording of the Articles of War declare.

This conviction of the truth of reincarnation is one of those instances of the persistence of a root-idea through minor transitory periods, like the last two thousand years of the world's history. Brittany, which is closely connected with the West Country in many ways, and also Wales, could tell many a story of similar unkilld truths that would make the Christian world open its eyes in astonishment. For the film of Christianity, which in its turn is a film on the surface of other religions, is very thin, and beneath its varnish lies deeply buried the glorious paganism of a past compared to which the last two millenniums are no more than a "dog's watch," as the sailor says—a mere two hours' interlude. Paganism it is, for the cities have none of it.

Only in the Latin "country settlements" do we find it, as the word "paganism" declares, and among the "people of the moors," as the good old German word "heathen" asserts. It is only city "urbanity" which has overlaid and killed the hardy old doctrines of the beginnings.

Even the public knows of cases, but the child takes real interest in them, and only the poor who find heaven's gate easier to pass can comprehend them. King Arthur shall indeed come and we believe it, else why has the tale, if it be a tale, persisted? Drake shall come, and shall he not anew form one of the brilliants of the diadem of heroes that Elizabeth drew around her? There are yet new worlds waiting for their Columbus, worlds as old as this America; and there are spiritual Eldorados waiting for their discoverer who comes armed with the passwords to lull the guardian dragons of the King's Treasure House. The golden apples of the Hesperides still await their daring hero, and the Atlanteans repeat their magic of making two ears of wheat grow where one grew before; of clothing the contents of Nature's picture gallery with flesh, and making new fruits where only weeds were seen; of conquering the realms of the air.

But as before, and as always, for those who do not and will not understand the truth unveiled, there are substitutes galore, stories in substituted words to suit the degree of the one who desires to see the truth from that standpoint of that degree, since he knows no

better and does not believe that a better exists. The selfish Atlantean magician need see no more than the oranges of California, at so many dollars a carload, in the golden apples of the Daughters of the Evening. An it so please him the twentieth-century Pizarro is perfectly welcome to behold his Eldorado of the West in the fever-haunted and mosquito-infested gold mines of the Orinoco. The Martin Pinzon of the hour may see personal honors and prospective wealth in mining claims at the South Pole, while his Columbus is showing him a new world to conquer in peace, in the name of human solidarity and brotherhood. The latter-day chauvinist may see in King Arthur's return the extension of the British Empire from North Greenland to Mount Erebus if he so wills. He may see in Drake's drum the Spirit of Elizabeth saving the trade supremacy of the British Islands, and none shall say him nay. But these are all substituted words in the drama-poem of life for the profane *polloi*.

"Which things are an allegory,"—illustrated by symbols, if you will have it so. It is their way of seeing the matter. Some see the golden apples of the Hesperides and are content if they may but grasp one of them. They may see their spiritual Eldorado in the West, and they may gather their gold without money and without price, as little children who have found the other end of the seven-hued rainbow of human promise. Columbus has already come again and discovered his new world, for all we can tell. The Sleeping Beauty of the Ancient Wisdom, Divine Knowledge, is awake once more, and maybe some of her attendants are still rubbing their eyes and wondering if *this* is a dream or if *that* was a dream.

And perhaps these too are substituted truths fitted for their proper degree. But they will serve. Those wise old ancients were right when they committed the truths of Divine Wisdom in parables to the very children in the cradles, so that the mother was telling them to her babe while the father was out obliterating monuments, or coursing "heretics," or persecuting Galileos in the vain endeavor to stop the world going round by destroying these memories from the earth. The despised peasants of a feudal system passed the word along one to another while church and state stalked hand in hand through the earth—but the low valleys where the peasants dwelt were overlooked. And so we have even in twentieth-century Brittany, in Ireland, in England, and Wales, in the heart of modern progress, signs that the old truths are lying very close to the surface under the new veneer and not infrequently protected by it, as the Egyptian inscriptions ironically were by the Christian plaster applied to hide them by fourth-century fanatics.

Drake's drum shall surely beat again. And for those who so wish to read it, it may mean the protecting hand of their hero. For others it may be the tocsin for the age of Elizabeth to come forth again in its glory—and the Spirit of King Arthur to live again. R. N.

Cap and Gown

THE custom of wearing a special cap and gown for academic purposes reminds us that the pursuit and teaching of knowledge was once regarded as sacred. When the ancient Wisdom-Religion and its

sacred Schools of the Mysteries departed, the churches, copying as usual the pagans, assumed the function of teaching; they failed to discharge their duty adequately, and the secular authorities took it from them. But we still retain a memorial of the old symbolic garb.

The churches would fain get the office of teaching back within ecclesiastical jurisdiction and the unfortunate shortcomings of our colleges give them a handle for their arguments. But, speaking generally, the churches are too well known to be the opponents of purely secular enlightenment to succeed.

No one can teach unless he is himself qualified. The most important thing to teach just now is self-control, and nobody seems qualified to teach this. The church aims at controlling by ecclesiastical authority, which is an enslavement of the mind; but true self-control springs from enlightenment—enlightenment as to the true laws of life. A college professor ought to be one who is thoroughly competent and certain on this head, and who shows by the example of his life that he understands life.

The acquisition of knowledge ought to be considered as inseparable from the idea of duty. The training of character should be the basis of all teaching. This is sufficiently well understood, but how to apply it puzzles everybody. The prime necessity is teachers who are men of understanding and character. T.

TELEPHONE conversations have just been held between Stockholm and Paris, and Sundsvall and Paris via Copenhagen, a distance of 2270 miles, with the aid of a microphone invented by two Swedish engineers.

ACCORDING to a French scientist who has made a special study of earthquakes, they can be predicted with more certainty than the weather. He arrives at this result by a comparison of the sun's and moon's positions and their influence on the earth's surface, as well as by considering the dates of periodic earthquakes in the past. But as yet he is unable to locate the spot or country where the earthquake will occur.

SIR Hiram Maxim narrated recently some of his experiences when he began experiments on flying machines sixteen years ago. One French mathematician proved conclusively that a goose, when flying, consumed 12 horse-power! Another, however, brought it down to one horse-power, and, ultimately, a third concluded that one-twelfth horse-power was the figure! These are indeed bad days for dogma!

THE interesting announcement is made, according to the *English Mechanic*, that gyroscopic compasses will replace magnetic ones on German battleships. The new compass has a 9 lb. wheel rotating 350 times per second, driven by an electric motor. The vertical plane through its axis is set in that of the meridian, which position it keeps unchanged, remaining unaffected of course by neighboring iron, or by the motion of the sea. It is said that on the *Deutschland*, while cruising, this compass, though left untouched, maintained its true direction for a month. Professor John Perry in 1890 drew attention to the principles underlying this use of the gyroscope. STUDENT

Walt Whitman: Reminiscences of a Visit to his Home in Camden, New Jersey

It was a hot and weary afternoon, but the dust was blown this way and that by an errant breeze that seemed to have slipped inland from the sea-shore by mistake, and the brain was busy with reflection and reminiscence. Down Mickle Street we went, a commonplace grassy thoroughfare and stopped before an even more commonplace house. It was the home of Walt Whitman.

A young man who seemed like a physician, but who later told us that he had been for many months Walt Whitman's nurse, invited us to enter and escorted us into the plain little bedroom where the poet had passed his last illness. Simple to the point of rudeness was the whole environment. There was the bed, here the armchair of the poet, in one corner, on the floor, a vast heap—bushels in bulk one would say—of manuscripts and other papers; near the window a rough, coarse, but withal generous and large table. It had been made, the nurse told us, many years before by Whitman himself. On a nail driven into the door-panel hung an overcoat, slovenly and faded as were wont to be the garments of Whitman's using, and on another nail hung the old gray broad-brimmed hat that is shown in one of the poet's best known pictures. It was on a June afternoon in 1892. Whitman had passed away in that bare little room in March of the same year.

Nearly forty years before, Ralph Waldo Emerson wrote to Walt Whitman, on receipt of a copy of one of the latter's books:

I give you joy of your free and brave thought. I have great joy in it. I find incomparable things said incomparably well, as they must be. I find the courage of treatment that so delights us and which large perception only can inspire.

I greet you at the beginning of a great career, which yet must have had a long foreground somewhere, for such a start. I rubbed my eyes a little to see if this sunbeam were no illusion; but the solid sense of the book is a sober certainty. It has the best merits, namely, of fortifying and encouraging.

This from Emerson, the born patrician, the very soul of refinement; from Emerson, who never could quite enter into the spirit of occasions when Whitman would carry him to some rendezvous frequented by ferrymen and teamsters; from Emerson, who once described *Leaves of Grass* as "a mixture of the *Bhagavad Gita* and the *New York Herald*!"

Walt Whitman had the soul of a mystic, the understanding of a mystic, and the heart of a seer. But his life, on some lines far from blameless, betrayed a lack of co-ordination between his acts and his ideal—on some lines only, be it said. For the nobility of his heart life was not blighted, only obscured and marred by a lack of understanding along cer-

tain finer lines of feeling, act, and thought that serve to differentiate the true mystic from one who oscillates raggedly between the two poles of matter and spirit. A marvelous and deep understanding of life and life's problems, of a true philosophy, yes—but lacking the feeling of heroic responsibility in this task of *living* the life and working out to the very last item the problems in its keeping.

Yet on lines of compassion and service Whitman stood so high, so very high, that he towers above his fellow-men as some tall peak lifts a snow-capped head above its fellows. When the war broke out and horror was

where shot and shell carried off one, and the dressing—though the term as used today has scant relation to what had to go by the name then—of gangrened wounds was a task with death standing on either side of him who did it. Nor was there then any adequate or even humane provision for nursing the wounded and the sick. It was mostly done by orderlies—young boys, as careless and ignorant in many cases as red tape, officialdom, and the selfishness of thoughtless youth could make them. Their almost wanton ignorance of the most elementary principles of nursing or of surgical care, their callous indifference to suffering, wrung from Whitman's heart the cry of a strong soul in bitter agony.

Whitman, who had suffered deeply, as strong natures must and ever will, felt the sufferings of others more poignantly than his own. In those hospital wards he was "the angel," "the savior," "the mother." He was nurse, physician, secretary, comrade, friend, and confidante, to the sick and dying. Day after day he poured out the blood of a great compassion, agonizing with the agony of the wounded, feeling every throb of their hearts, every longing of their minds, wounded to almost bitterness of expression by the selfishness and inexperience of their hired attendants. In some of his finest poems the agonies of that time later found voice and expression, and we look in vain for a trace in them all of selfishness or indifference. They are pure utterances of compassion, not as Emerson would have uttered them, or you or I perhaps, but as Whitman would, and did.

The critics have done Whitman as much harm as good. Some have seen in his writings "a heap of balderdash," "shocking grossness," "lists of trivialities," and no poetry at all. Others, with some conception of that message of life which Whitman did so boldly deliver in so far as he understood it, and this was very far compared with average humanity, have all but deified the man, seeing even in his irregular life and slouchy ways, in the very holes of his overcoat and the spots upon his hat the signs unfailing of genius.

Both are foolish extremes. The Theosophist sees in his writings the heart of the true mystic, a great, over-masteringly great soul, striving to utter itself but unable to translate into every single act of the life its own pure idiom because of the man's misunderstanding of his own powerful nature. The Theosophist sees here and there in his writings a coarse mistakenness of expression and of ideal. Yet Whitman's more inspired words ring out their message above the uninspired and over all the din of his personal failings and mistakes, for in his writings unbrotherliness has no part. H.

WALT WHITMAN

EVER the discouraged, resolute, struggling soul of man (have former armies failed? Then we send fresh armies—and fresh again). Ever the grappled mystery of all earth's ages, old or new; ever the eager eyes: hurrahs: the welcome-clapping hands: the loud applause: ever the soul dissatisfied, curious, unconvinced at last; struggling to-day the same—battling the same.—*Whitman*

added to horror, wrong to wrong, Whitman threw himself, soul and body, into the very hell and bitterness of the conflict. Not in the ranks, however, but in the small-pox and surgical wards of the army hospitals, did he give all the best of his rich life and very nearly life itself.

For in those days medical science had many gaps in its learning, and surgery was practically helpless before the demon of infection. Hospital gangrene was carrying off dozens

Hast thou attuned thy being to Humanity's great pain, O candidate for light? --- *Voice of the Silence*

IF the mothers of the world had a knowledge of Theosophy and the wisdom to use it, in no long time the race would receive such an impetus upward as would break the fetters of all past creeds and forestall the need of future reforms.

Before and after birth, in the formative and growing periods of the child's body, mind, and character, the intimate relation between child and mother makes her the most vital of all influences. The children of today make the world of tomorrow. Considering what life is at present, and historically reviewing what it has been, who can claim that human motherhood has held the key for developing the best in the wonderful child nature? Can the most sanguine advocate of modern progress show any evidence that at last the fresh, incoming souls are being taught to grow more and not less conscious of their divinity? In demanding a vote wherewith to right legal wrongs, the ardent suffragist may well consider seriously how far woman has proven her fitness for this new duty by her ability in governing the child so as to rule out his evil tendencies.

Think what life might mean today if the best in each generation had been progressively called forth and nurtured. There would be no comparison with the diseased, unsatisfied, selfish existence to which we are continually trying to readjust ourselves. Maternal devotion is as old as the race; indeed even the animals show instinctive love and protection for their offspring. Evidently blind mother-love—like blind faith in theologic creeds—is not enough. There must be the guiding light which comes from a definite knowledge of the true philosophy of life.

The Theosophic mother would recognize the child's right to be well born, and would begin by attending to the quality of parentage which should be the newcomer's first birthday gift. She would know that the condition of her own body and mind and morals must play a large part in deciding the character of

Theosophy for Mothers

the incoming entity which would be attracted to its own in seeking suitable conditions for the desired earthly experience. She would know that contrary to certain current theories,

THE GRASS-WORLD

OH, life is rife in the heart of the year,
When midsummer suns sail high;
And under the shadow of spike and spear,
In the depth of the daisy sky,
There's a life unknown to the careless glance;
And under the stillness and airy prance,
And slender, jointed things astir,
And gossamer wings in a sunny whirl—
And a world of work and dance.

Soft in its throbbing, the conscious green
Demurely answers the breeze;
While down in its tangle, in riotous sheen,
The hoppers are bending their knees;
And only a beetle, or lumbering ant,
As he pushes a feathery spray aslant—
Or the sudden dip of a foraging bird,
With its vibrant trail of the clover stirred,
Discovers the secret haunt.

Ah, the grass world dies in the autumn days,
When, studded with sheaf and stack,
The fields lie browning in sullen haze,
And creak in the farmer's track.
Hushed is the tumult the daisies knew,
The hidden sport of the supple crew;
And lonely and dazed in the glare of the day
The stiff-kneed hoppers refuse to play
In the stubble that mocks the blue,
For all things feel that the time is drear
When life runs low in the heart of the year.

Mary Mapes Dodge (Selected)

the mother does not make her child a musician or an artist or what not by prenatal cultivation of music or of painting, etc.; but in striking a certain keynote of harmony and beauty, or otherwise, she would thereby attract re-

sponse from the like type of entity which was related to her under the Karmic law.

She would begin the foundation for the ideal body by strengthening and purifying her own, for it has to contribute largely in upbuilding the child's. She would begin his education by training and disciplining her own mind and will, perhaps thereby avoiding the sorrow of seeing her beloved child as well as herself overcome by the same weakness and failing to teach him this lesson which she had evaded. She would know that indulgence in whims, tempers, and appetites, would be reflected in her body and brain cells and would leave her ill prepared to control the child whom she thus invites to come home to her handicapped with her own faults.

The Theosophic mother would regard the advent of the child as the arrival of a soul, wearing the little body as a garment, and would take on a new and enlarged sense of the motherhood which could wisely meet the wants of this dual nature. From the first she would aim to make the child the center of simple, natural conditions so that his early impressions in the material world would be of the kind which strengthen the permanent, individual sense. She would not enervate him with the customary intense, continual personal attention which is often a sublimated sort of self-indulgence in mothers. She would remember that at the center of this little creature is the great soul, and would challenge it to come forth and find a right knowledge of itself in the puzzling maze of matter in which it was involved.

She would believe in the evolution of the physical, mental, and moral natures—the working outward from a conscious spiritual center—and would not be deceived by the prevailing educational methods which aim to cram so much *into* the child while evoking—drawing out—so little. She would not lead him by her own blind devotion to expect things and persons always to relate themselves

to him; but she would try to cultivate in him the flexible strength and the sense of unity with all life which is born of relating oneself to surroundings. She would know that the delicate little body had latent tendencies of unknown power and would early begin to direct them along lines leading to the development of a valued servant out of the physical force instead of allowing it to become a tyrannous master over the higher nature.

The Theosophic mother would remember that the present life is but one stage in a journey to perfection and she would not sacrifice the ultimate good of this Comrade-soul for some creature comfort or present indulgence. L. R.

Another Harsh Lesson at the Hands of the Law

EXPONENTS of the traditional missionary methods are seemingly on the eve of waking up and of vigorously protesting against, if not absolutely eliminating, certain features of their system. As seems to be most often the case in the present state of human blindness, a frightful tragedy has appeared, to voice its "open sesame" before this one hitherto fast-locked portal of the missionary structure, and the results promise to be far-reaching, a great step in the right direction. The pitiable feature is that such tragedies are necessary, but they seemingly are and will be until those who stand forth as teachers of the people gain a knowledge beyond that of their systems, and a moral poise that cannot be disturbed by any waves of emotionalism and sentimentality. Until that time sacrifice will be heaped upon sacrifice, for the evil forces in human life will never be conquered by those who do not understand them.

In today's paper a number of clergymen, well known in the city of New York for their advocacy of Christian mission work among the Chinese, are open in their denunciation of the whole system as at present carried on. The occasion for their long-delayed expressions of horror and dismay is the murder of a beautiful girl, a granddaughter of General Sigel, by a Christianized Chinaman who had become infatuated with her and insanely jealous of a fellow-countryman who had also been converted to Christianity.

This girl had been for many years, in company with her mother, an enthusiastic mission worker among the Chinese of New York City. Her zeal for the Church may have been colored by slightly sentimental motives or it may have been flatly misunderstood by her alleged converts. Whatever the cause, no word imputing base motives has been uttered against her, and her connexion with a prominent and honored family no less than the fact that in her mission activities she worked side by side with her mother, all go to show that something in connexion with the system itself must be inherently wrong. This is what

one clergyman has to say upon the subject:

Any mission plan that calls for a white girl for every Chinese is atrocious. We do not give a girl instructor to every Italian who comes among us, and we ought not to hold out that inducement to Chinese. All the same, it is done and it will be done. A way should be found to stop it. A list of the mission girls who have come to grief through Chinese whom they were teaching would fill an entire page in a newspaper. That list would be read everywhere as an awful object lesson in depravity. Nothing short of some such exposure will stop it. The people need to be horrified. I shall be in sympathy with any measure, however shocking, to save our young women from a continuance

results and in many cases was eliminated because it threatened evil.

And still another states that

The present feeling of the body of the clergy is very strong for the complete elimination of the system to which Elsie Sigel was sacrificed.

Just why a system of individual teaching was ever inaugurated among any set of possible converts, from any nation whatever, or any grade of society, must stand as one of the unanswered questions of today. Those who founded it surely knew little of human nature and less of the *actual* philosophy of Jesus the

Christ. This latest catastrophe in the ranks of young women mission workers should not be considered unique or merely a sporadic coming to the surface of some limited evil, for it is nothing of the kind. It is merely the highest peak of a long range of vast extent, whose lesser peaks would each look gigantic and unique if on some plain, alone. The measure must include all that category of awful happenings stopping just short of murder which the clergyman first quoted alluded to so plainly.

In this light it is easy to imagine the feelings of those who foresaw these calamities a generation ago and who were persecuted not because they opposed openly, but merely because they did things differently themselves and offered to the world proofs of their wisdom in Theosophy itself. The present seems to be a time of focussing, of culmination, both in the realm of evil and that of good.

The missionary system is not the only one that has arrived at the flat necessity of being either bettered or eliminated, through the gateway of some frightful tragedy. H.

Signs of the Times

THE following paragraph is clipped from the Los Angeles Examiner of July 4:

PASADENA, July 3.—Resolutions were adopted at the meeting of the Lincoln Avenue City and County Improvement Association, numbering among its members the select of the North side, asking the Board of Education to investigate charges against the high school and to accomplish the segregation of the sexes in the city schools.

Within the last year two schools not a thousand miles from California, were closed at the instance of teachers and principals, as a *dernière ressource*, those in charge plainly stating that they found themselves totally unable to cope with certain ruinous habits which were rife among the students. Within the month news has come of a serious condition of affairs in one of our State universities, in the form of so-called "secret marriages" among the students.

These questions too vitally affect the welfare of the home to be passed over unconsidered by parents, and so the Pasadena community seems to think, for parents constitute the majority of members in the Association now taking active measures to the end of purging the city school system. STUDENT

MARGHERITA KRONBERG
A YOUNG SWEDISH ARTIST

FOR with a gentle courage she doth strive
In thought and word and feeling so to live
As to make earth next heaven; and her heart
Herein doth show its most exceeding worth,
That, bearing in our frailty her just part,
She hath not shrunk from evils of this life,
But hath gone calmly forth into the strife,
And all its sins and sorrows hath withstood
With lofty strength of patient womanhood.

Fragment from *Irene* by Lowell

of this infamy, and with what feeble force I have I will speak for it.

Another clergyman reminds the public that "this fad" (fancy a clergyman calling mission work a fad!):

which twenty-five years ago enlisted nearly all the prominent churches in individual work bore no good

OUR YOUNG FOLK

Maria Felicia Malibran

MARIA FELICIA MALIBRAN, one of the brightest stars who ever shone on the operatic stage, was illustrious for the versatility of her genius and her noble character.

She belonged to a distinguished family of Spanish musicians. Her father, Manuel Garcia, was a noted singer, actor, composer, and conductor, and unrivaled as a vocal teacher; her brother, Manuel Garcia, who lived to be over a hundred years old, was one of the greatest singing teachers who ever lived and the inventor of the laryngoscope, which instrument is of great value to the medical profession; while her sister, Pauline Viardot, was unsurpassed as an operatic singer and was a very remarkable woman of varied talents and accomplishments.

Maria was born in Paris in 1808. At a very early age she spoke fluently Spanish, Italian, French, English, and later she learned German. Although her voice naturally had many defects they were transformed into beautiful powers of expression through her father's very severe training and her own indomitable will and perseverance. The rare charm and power of her singing was equally great in every style of music and she enraptured and inspired everyone by the grandeur and depth of her expression. She also possessed remarkable creative ability and had a deep understanding of the science of composition. She composed both the words and music to many beautiful songs, and her free improvisations on the stage fairly electrified her audiences.

Malibran was an excellent pianist and although she was never instructed in dramatic art, her acting showed the sympathy and fire of genius and she was equally successful in all rôles, whether comic or tragic.

This gifted woman acquired without lessons great proficiency in drawing and sketching, while in dressmaking, embroidering, etc., she was as accomplished as in singing; for athletic sports she had a special fondness, and she spent much time riding, swimming, skating, and fencing. Her love for children was very great and she took much delight in teaching them, playing with them, and making them happy. In the social world Malibran was the delight and inspiration of her friends and charmed all by her brilliant conversation as well as her sweet and amiable disposition.

In this superb artiste the Soul found expression in many ways, and greater even than all her other gifts were her generosity and kindness of heart. It was as natural for her to give as it was to sing or breathe, and many beautiful anecdotes are told of her rare tact and delicacy in bestowing kindnesses which made them doubly acceptable. Many notable careers were made possible through her assistance and many lives were saved from ruin,

SHEPHERDESSES RESTING ON STILTS,
LANDES, FRANCE

MUSIC, in thee we float,
And lose the lonely note
Of self in thy celestial-ordered strain,
Until at last we find
The life to love resigned
In harmony of joy restored again;
And songs that cheered our mortal days
Break on the coast of light in endless hymns
of praise.

Henry Van Dyke

yet she was ever modest and did not wish her benefactions known.

With her second husband, M. de Bériot, the famous violinist and composer, she gave wonderful concerts.

Malibran had such remarkable courage and strength of will that she triumphed over every difficulty and was so faithful to any duty that not even severe illness prevented her from fulfilling her obligations. It is a great pity that she had not learned to conserve her energy, for her death when only twenty-eight years old, was caused by over-exertion.

The keynote of the life of Maria Felicia Malibran was *unselfishness*, and that is why she gave so much happiness to others and was so deeply loved and honored by all the world.

A RÂJA YOGA MUSIC TEACHER

The Landes

THE Landes, a region in the southwestern part of France, takes its name from the sandy plains or *landes*, of which it is chiefly composed. These plains were once covered by the sea. Now they are the haunt of flocks of sheep, which are tended by shepherds and shepherdesses who traverse the sandy plains perched on stilts, as the picture shows. The condition of the soil, now sandy, now marshy, renders this mode of locomotion less wearisome than going on foot. What young folk do as a sport in some countries, these sheep tenders of the Landes thus find a useful expedient. G.

A Legend of the Indian Rock at Squantum

THERE are many interesting legends connected with the settlement and explorations of our New England forefathers, and many spots where tradition still lingers. One of these stories which is not generally known and which is said to be authentic is told of how the high bluff at the end of a long promontory in a part of Quincy, Mass., now known as Squantum, received its name.

The story tells that the bluff was first seen by an exploring party of which Myles Standish, William Bradford, and Josiah Winslow, all of colonial fame, were members in 1621. They entered Boston harbor at twilight and decided to spend the night on an island, now called Thompson's Island where there was an abundance of lobsters and clams. The following morning they set out in their boat towards the mainland, their old Indian guide and friend, Squanto, steering them. As they neared the shore they beheld a gigantic Indian's face gazing over the water in stony calmness, the rocks of the bluff forming a decided outline of the Indian features. The amazed Standish gave orders to land at that point, saying that he took it as a good omen for a settlement. They landed, and then Squanto, who seems to have had a premonition, reverently knelt before the face and asked the Great Spirit to protect his people from the dangers which seemed to be coming from over the great sea water. Squanto had been a kind friend to the colonists, being their interpreter when the first treaty between the Indians and themselves was made in New England. So the exploring party named this point "Squanto's Chappell" because of their regard for him. H. M.

THE CHILDREN'S HOUR

The Story of a Gold Fish

BUDDIE was a little gold fish and he lived in a great glass bowl, with six or eight brothers and sisters. He was the largest one of all and he thought he was even larger, so important did this little fish feel himself to be.

He liked to swim to the side of the bowl where the water magnified him, and look at people with his big eyes, and open and shut his funny oval mouth; and he liked to swim round and round to show off his long tail for he knew that none of his brothers had such a fine tail as he.

One day, Buddie discovered a curious thing. It was the fresh water as it slowly dropped into the bowl from a little pipe. "Now see me catch it," said he. So he made a jump at it and *plunk!* he went against the glass and bumped his nose; but that did not discourage him. "Now once more," said he, and *plunk!* he went against the side of the globe again and bumped it so hard that he made his little nose ache. But he soon forgot about his bump when he saw his big friend, the man, coming through the door with food for all the fish. So they swam to the top of the water, Buddie first, and took the food from his fingers as he held it out to them.

Then Buddie showed his brothers how far he could put his head out of the water to take the food, for he was not a bit afraid of the man. But the man said "Be careful, little fish, or you may jump out of the water, and then you will be sorry." But Buddie paid no attention to what the man said and kept jumping and sticking his head farther and farther out of the water; "for," said he, "I wonder how it would be to see the world. I am tired of this little bowl, anyway." So he kept trying and trying, and one day, *flop!* he went on to the table, and *flop!* he went again on to the floor.

"Oh dear me!" he cried, "What is the matter? I cannot breathe, I cannot swim, I can only flop and it hurts me to flop on this hard floor. Oh, what shall I do? I did not know the world was like this." And there on the floor the man found the poor little fish, almost dead for being out of water so long.

"Poor little silly fish!" said he as he tenderly picked up his almost lifeless pet and put him back into the bowl, "I don't know whether you will revive but we will give you a chance. I hope if you do, you will have learned a lesson and be content to see just as much of the world as it is intended for you to see and no more."

Buddie did revive, but he is a sorry looking sight, for his little fins are bent and torn, his back fin twisted and broken, while his long beautiful filmy tail is in tatters from flopping

THE ELEPHANT'S VISIT TO THE RAJA YOGA DAY SCHOOL IN SAN DIEGO

THE QUEER SCHOLARS

THE sun was shining softly,
The day was calm and cool,
When forty-five frog scholars met
Down by a shady pool—
For little frogs, like little folk,
Are always sent to school.

Their lessons seemed the strangest things,
They learned that grapes were sour;
They said that four and twenty days
Exactly made an hour;
That bricks were made of houses,
And corn was made of flour,
That six times one was ninety-five,
And "yes" meant "no" or "nay."
They always spent "to-morrow"
Before they spent "to-day,"
Whilst each commenced the alphabet
With "z" instead of "a"!

As soon as school was over
The master said, "No noise!
Now go play at leap-frog
(The game a frog enjoys),
And mind that you behave yourselves,
And don't throw stones at boys!"

Selected

so long on the hard floor as he lay helpless.

No! I do not think he will ever try to "see the world" again. He is a sadder and a wiser fish; he is now content to stay at home in the bowl with his brothers and behave himself.

EUGENIA

A Propagandist

LITTLE Frankie was slowly and earnestly stamping round the veranda.

"What are you doing Frankie?" asked his uncle who was lying in the hammock.

"I'm marching in step and in time."

"What for?"

"I'm making harmony," answered the little

boy. "It makes harmony when people work together. You can only see me, but I'm pretending there are other children too, so I must be careful or the line will be spoiled," and on he went again.

His aunt laid down her sewing as he returned.

"Frankie," she said, "do you like the new school?"

"I love it," he answered. "Didn't you know it was a Râja Yoga School, Auntie?"

"Yes dear," she said.

"I'm learning to be a Râja Yoga," Frankie went on, "and that is why I mustn't cry for things, or bother for them when you say no, or tease the pussy, or destroy things."

His uncle laid down his paper.

"I used to break up all my toys once, when I was silly; now I'm learning to make things," said Frankie, confidentially, "and it is nicer to make than to

break, isn't it, Auntie?"

"Yes dear," she said again.

"I guess Matilda was wiser than we were, eh Mother," said Uncle Jack, as Frankie, catching sight of his mother in the distance, ran to meet her.

"There must be something in Theosophy, if they teach the children those ideas."

"Matilda was always practical and had common-sense," Auntie Alice returned, "and undoubtedly she has chosen well for the child; the world has moved along since our day."

"Suppose," said Uncle Jack, "we move along with it," and Auntie smiled. E. I. W.

In the Garden

ONE day, after oh, so much work, the new lily-pond in the wild-flower garden in Lomaland was finished.

There was a place for the birds to bathe, and a place for them to drink, with little steps nicely arranged for them to stand on, and such fine plants all around the margin of the pond—a banquet place indeed. And the moment it was finished the birds began to come, dozens and dozens of them. They kept coming all day, and since then they do the same every day from sunrise to sunset. How do you think they heard about it? Who gave them the message that this Birds' Brotherhood Headquarters had been prepared for them? E. W.

A Learned Terrier

MASCOTTE is the name of a terrier who knows three languages. She shows that she understands them by doing tricks ordered in any of the three tongues. When Mascotte's puppies grew up and left her, she made a companion of a beautiful Maltese cat whom she herself had adopted as a kitten and had brought up with her own little ones. G.

Dogmatism in Science

"THE Tyranny of Scientific Dogma" is not the title of an article by a Theosophist, but that of an article in *Engineering* (London), reprinted in the *Scientific American*. It has, however frequently been maintained by Theosophists, and notably by H. P. Blavatsky herself in *The Secret Doctrine*, that there can be and often is such a thing as a scientific dogmatism; and the writer of the above article echoes that opinion. It should be pointed out, though, that it is unjust to lay the blame for dogmatism on the shoulders of the leaders, whether in science or in religion; the followers are responsible for at least an equal share thereof. As is shown in the article, the scientific dogmas are for the most part beliefs or prejudices in the mind of the lay public, which they cling to through mental idleness and lack of independence and of originality. Let them not, therefore, turn around and blame the leaders of science, even though these be culpable, until they have set their own house in order.

The writer begins by saying that anyone who sets about inquiring into the reasons for his own belief in certain articles of his scientific faith will be met by surprises. He will discover that he has been living under a tyranny, to resist which means the risk of perdition. Examples may be cited by the dozen.

The great mass of students accept a value for the thermal unit of energy fixed by one man, Joule; Joule said it was 774 foot-pounds, and 774 foot-pounds it is. This may be perfectly true, or perfectly untrue; the point is that anyone who accepts it on such grounds is a dogmatist. People have often held such dogmas tenaciously, on grounds whose weakness has been subsequently revealed by independent inquiry.

The writer refers to Judge Stallo's remarkable book, *Concepts of Modern Physics* (note—not *conceptions* of modern physics), written about 25 years ago, to show that much which science held to be true was simply the result of the utter confusion of thought. Other writers followed Stallo's line. H. P.

Blavatsky quotes from him in *The Secret Doctrine*, in illustration of her own arguments. This author, whose book should be well studied, shows that many of the terms which science uses as denoting actual things in Nature, really stand for nothing but "concepts"—that is, mental abstractions. For instance, science has sought to resolve the universe into a duality of force and mass, and to regard it as made up of these two. But neither one

of these two, as an independent entity, is known to science. Force is known only as a property exhibited by Nature, but cannot be isolated, either in actuality or in thought; and mass, when analysed, similarly vanishes into a metaphysical conception. The word "matter" has been loosely and confusedly used to denote, now the coefficient of force (mass), and now the product of the supposed interaction of force and mass. And so with "energy," "heat," and other terms.

The writer speaks of energy (about which a note recently appeared in the *CENTURY PATH*, vol. xii, no. 34), as a thing about which it is practically impossible to get any two persons to arrive at a common definition. As shown in the note just referred to, the only

rational idea we can form of energy, except as an abstraction, is that of an emotion or condition of consciousness, existing in a mind; yet even this again is an abstraction, and we must speak of energy as a being.

The next point made is that many things dogmatically held to be impossible are subsequently achieved by actual experimenters; of which it is superfluous to quote instances. He comments on the way in which we accept things on authority, without the least inquiry, as absolutely true: another proof that the dogmatism is quite as much ours as that of our teachers. For instance, Maxwell formulated the "molecular bombardment" theory to account for the pressure of a gas on its containing vessel; and students are still taught that the pressure of a gas is due to the impact of molecules against the walls of the vessel. But this theory only holds good on two assumptions: that the molecules are perfectly elastic, and that the walls are either perfectly elastic or perfectly rigid; and the latter condition is not true. Failing these conditions the pressure of the gas would gradually fall off, because the molecules would lose energy. So an experimenter kept some gas under pressure for a long time, to see whether the pressure would fall off; and found that it did not. Hence the theory is inadequate.

In many ways our progress is cramped by our inconsiderate acceptance of statements; the writer instances the case of steam-pressure, in which we are bound down by the pronouncements of Regnault. But men of light and leading ignore these dogmas, of which they are very likely ignorant, and hence make discoveries.

In commenting on the above, one may begin by freeing oneself from a certain dogma—

The Lost Science of Logic

the dogma that it is necessary to think in the accepted categories and to speak of science as one thing, religion as another, and so on.

Wanted —
a few
"Why"s

Let us speak of dogmatism in general. The point, then, is that we all cramp ourselves by undue respect for the spoken or written word.

Often some great authority makes a pronouncement which is forever after accepted on his authority without further question and copied from book to book until it becomes almost an axiom. Then some day an unread individual, who has not heard of this gospel, unwittingly transgresses it—like the man who forgot that his prison-door was supposed to be locked and absent-mindedly walked through it.

There are accepted dogmas in science, in religion, in daily life, which rest on very shakable authority; their validity may depend only on the fact that no one has yet thought of questioning them or dared to question them. But the man of independence and originality may arise any day and prove that there is no lion in the path after all.

"You mustn't do that, it's impossible!" is a frequent cry; and if you do it, you are a magician or an impostor.

Unverified
"Authorities"

"Laws," whether of Nature or of some other recognized authority, are sometimes quoted for the purpose of overawing people or making them subscribe to certain desired opinions. But perhaps the authority has never said anything of the kind. The "child" is a great disturber of established conventions. He has no respect for the possibilities and is apt to be too literal. He steps on the grass, not seeing the notice-boards, pokes his fingers through the specters, and stretches the laws of Nature.

This line of thought is profoundly suggestive. If we set ourselves to think strenuously how much of our conception of things is made up of dogmas, we shall probably realize that a vigorous sorting of all this lumber would result in a much altered view of life. Our notion of our own personality is a terrible dogma; we believe ourselves to be possessed of certain virtues and certain vices, and sundry abilities and sundry disabilities, and so on; and we limit our actions accordingly. Whereas, if we could but wake up some morning entirely free from all prejudice regarding ourselves, we might astonish the world with our deeds. There is a story of a fish that had a sheet of glass put across his swimming tank, and he bumped his nose against it for a whole year. When he finally realized the presence of the obstacle and shortened his daily swim, the glass was removed; and then the fish ever after kept up the shortened swim. But men are subject to similar infatuation, similar self-imposed limitations.

The spirit of free inquiry is always to be commended, as that of dogmatism is to be condemned; and science must incur praise or censure according as it manifests the one or the other. When the name of science is used to shelter mischievous dogmas about the nature and possibilities of man, it is time to protest; but no fair critic will accuse the protester of belittling genuine science. STUDENT

Fatal
Weaknesses
of Thought

as, if we could but wake up some morning entirely free from all prejudice regarding ourselves, we might astonish the world with our deeds. There is a story of a fish that had a sheet of glass put across his swimming tank, and he bumped his nose against it for a whole year. When he finally realized the presence of the obstacle and shortened his daily swim, the glass was removed; and then the fish ever after kept up the shortened swim. But men are subject to similar infatuation, similar self-imposed limitations.

The spirit of free inquiry is always to be commended, as that of dogmatism is to be condemned; and science must incur praise or censure according as it manifests the one or the other. When the name of science is used to shelter mischievous dogmas about the nature and possibilities of man, it is time to protest; but no fair critic will accuse the protester of belittling genuine science. STUDENT

The Age of the Earth

IF men of science always adhered to their own professed way of reasoning, they would never venture upon any pronouncement respecting the age of the earth. For, recognizing that the data for such a calculation are extremely vague and incomplete, they would know that any such pronouncements could be no better than guesses. But they do not always adhere to their own principles, nor can we blame them—at least, so long as they are willing to admit their transgression and do not claim the same authority for their speculations as if they were securely founded. The wish to arrive at a conclusion is natural, and so is the impatience which scorns to wait.

When Darwin wrote his *Origin of Species*, says a paragraph, many geologists thought the earth must have been in existence at least 230,000,000 years. But then, alas! came the calculations of the physicists, who showed conclusively that even the sun himself could not have existed for more than half that period. Their calculations were based on the assumption that the earth was once white-hot and had been cooling by radiation ever since. Obviously such a theory was liable to overthrow; the earth may not have been white-hot, or it may not have been cooling regularly by radiation. And, in fact, the chemists have now come forward, armed with radium, to show that, as radium has been heating the earth all the time, it must have taken very much longer to cool.

The latest on this point is that the Hon. R. J. Strutt writes to *Nature* to say that a sample of a mineral (printed as "thorianite") was found to contain nine cubic centimeters of helium gas per gram, which must have taken at least 240,000,000 years to accumulate. So now it is geology and chemistry versus physics. Clearly, so far as this kind of evidence goes, the earth may be any age at all, for there is not enough to reason from; and this is leaving out of account all those other discoveries that are bound to be made as time goes on and each of which will lend new factors to the problem.

The age assigned to the earth by the chronology of the sacred books of ancient India runs into strings of figures that would stagger a modern scientist. Yet, with radium to back us up, we can afford it. And periods of time are vast only by comparison. Use larger units and the imagination, and there you are.

STUDENT

Latin Proposed as Universal Language

SOMEONE has proposed to supply the alleged need for a universal language by using Latin, as it is a real language, not an artificial one, and exists all ready-formed. Critics have made the objection that it is a written language and not a spoken one; it is not adapted to modern inflexional requirements, and each nationality would adapt it to its own ideas of inflexion and pronunciation. It seems obvious, indeed, that any language that might be formally adopted as a universal language would be subject to such local modifications; if Latin were forced upon the children in the schools, would not each nation soon acquire a local Latin, and the divergences go on until the original uniformity was barely recognizable?—as has, in fact, actually hap-

pened in the history of that very language.

Yet this is only half the truth and does not constitute a valid objection. For, though different nationalities might continue to use their own languages, there still might be a recognized language for international use, and this is doubtless the idea in the minds of advocates of a universal language. Such language, however, would be rather of the nature of a code or system of shorthand.

It seems as if the advocates of a universal language had overlooked some of the essential features of language. Language is not merely a code of arbitrary symbols. It is related to thought and feeling in some mysterious way. The baffling way in which slang, argot, and dialect are evolved indicates the operation of these mysterious laws. Language seems to grow out of the racial consciousness of a whole people, and it is as impossible for one man to sit down and write a new language as it is for a composer to make a new folk-song.

But this argument tells in favor of the possibility of a universal language; for, if the world becomes united into one people, will not that one people evolve its own language? The very binding together of the world (effected by science) which has provoked the aspiration for a universal language will tend to bring about the realization of that aspiration.

In short, the state of affairs as regards languages is always adapted to the needs of the times; and if the world has diversity of tongues, it is because it has diversity of races, customs, and tastes. The more it gets unified, the more its tongues will get unified. The attempt to force on the language-conditions, to a point ahead of that which the conditions demand, is futile; but, again, such attempts may be regarded as effects rather than causes, and as actual steps in the process by which race-union is bringing about language-union.

The best that can be done, probably, is to watch tendencies and help them on; thus we may avoid artificiality. When we get so unified that it will be positively inconvenient to be without a common language, we shall soon evolve it. Tendencies this way have already been noted; technical terms are nearly all common; in some parts where races exist side by side, blends of idiom are observed, as in the pidgin English of the treaty ports; or in some German districts of America "gespokene sprache."

STUDENT

The Panama Canal

THE provisions contemplated for the safety of vessels are unprecedented. Vessels will not be permitted to approach or to pass through the locks under their own power. They will be handled by powerful electric towing locomotives running on tracks; some of them ahead for towing, and some of them astern for checking the vessel's way. The vessel will thus be in absolute control of the canal officials. Moreover, the gates will be in duplicate, with a considerable space of water between. And further, on the lake side will be a reserve skeleton-gate full of raised sluices, ready to be swung across, if any accident should happen to the other gates, the sluices being then closed, so preventing the escape of the lake waters, and at the same time leaving the lock ready to be dried out for the necessary repairs.

Some Views on XXth Century Problems

What of the Rest?

THE well-known English religious writer, signing himself "J. B.", in an article on "Proportion in Religion," raises a point which the Christian world would do well to face more frankly and completely than ever heretofore.

The enormous enlargement of the horizon in our times has put the religious picture out of perspective. We need a new drawing on a new scale. . . . Today we have to do . . . with an immeasurable opening behind. Christian people, from the beginning right up to our own day, have been contemplating religious history as an affair of at most 6000 years. It is a period covered by the Bible and limited by it. But this encircling wall has now been broken down. Science is revealing to us a world of human beings, of people with bodies and souls, living and dying, practising their arts and their religions over periods so vast that the Bible story compared with them is a mere episode.

If the world is asked to believe that God so loved it that he sent his Son, it will in return ask, "When did that love begin? Two thousand years ago?"

But if it began with the world's beginning, how did it show itself during the countless civilizations and countless thousands of years before that event that took place only two thousand years ago? Why should it not have shown itself to them as to us? Some of these civilizations seem to have been morally higher than ours; some to have been intellectually as high or higher; some perhaps mechanically as high or higher. Were they not as worthy as we of the same effort? Were not their thinkers as worthy of light, their people as worthy of guidance and of *the same light and the same guidance*? If not, wherein not? If they were *not* given this same light and guidance, we must stop crediting God with *love of the world* and speak — if we can — of his *partiality to us*.

The Christians must face this. If they say that we alone, for the first time, had the real light — their case is lost. The thinking world and the "heathen" world will not listen further now to them. If they admit that those other peoples had the same light, then its records have the same claim as our own to consideration and study and reverence; the words of their avatars and the persons of their avatars the same claim as the words and person of ours.

STUDENT

The Mind of the Heart

A RELIGIOUS review once asked its readers to send in, as many as chose, some definition of their conception of God. The writer of one reply quoted Arnold's "stream of tendency" and invited the editor to alter his request into one for a definition of this stream.

There is an Indian legend of a youth who desired to see in dream the World-Maker. By fastings and the like he had succeeded in seeing the World within and without, and its beings. Now he would see the Maker. But instead a spirit came to him, telling him that the Maker must be found and felt in what he had made, having no form.

During the progress of the Boer War a retired English officer asserted in a letter that

he could feel the feelings of the troops from day to day, especially when in the early days they were depressed and anxious from reverses. "If I could only have sent back to them," he said, "a corresponding encouragement!" Perhaps he could and unknowingly did.

We are almost entirely absorbed in our own little affairs, taking the color of feeling from our success or failure or danger in them; not noticing that fainter and larger background of feeling which nevertheless contributes always something to our local mood. If throughout an orchestral piece the double-bass continuously sounded the deep keynote only, we should ultimately cease to notice it despite the fundamental import of its contribution.

If we were asked to define a greatening character, the set of the "stream of tendency" in a character to become great, we should all finally agree that it was the mergence of self-interest, of the sense of personality, in the larger field of interest in the welfare of others. It would be the loss of personality, the loss of *I*, in the instant reaction to the needs of others, especially to their pain. "He never thinks of himself" is the ready expression. The sense of personality is gradually developed from the individual experiences of the unit. There must have been a period far back in its evolution when it had no such consciousness. Then comes the long progress; consciousness is intensified in the experiences of personality. Then with that gained intensity and perfection, losing nothing save its limits, it takes on again the greatness of the whole, entering into unity of feeling with all the rest that live.

So we can understand Arnold's "stream of tendency" as a divine force for unity. It is the essence of which man's heart consciousness is formed, and it can only be understood by its own light. The first understanding of it is the awareness of the feeling of compassion. The fuller understanding only comes when the fabric of a higher mind has been woven from the infinite complexities of that feeling. Compassion leads to understanding, the *with-feeling*, and finally leads to the growth of a transcendental mind of its own nature.

STUDENT

Stone and Concrete

THE Egyptian obelisk now standing in New York's Central Park is gradually losing its inscriptions. Clear and sharp for thousands of years while the column stood on the sands of dry-aired Egypt, they are being dissolved away by the acid rains and mists of our eastern climate. Twenty-eight years have done irreparable damage.

There is something of an archaeological lesson in this. The great rough columns of Carnac in France, of Stonehenge in England, may once have had inscriptions, like the obelisk from Egypt. Science gives them but three or four thousand years of age. If, as science will soon, we multiply that by ten and more, we can begin to imagine what the rains and frosts may have stolen from us.

The technical magazine *Stone* argues for

the material from which it takes its name, as against the modern concrete. Of the latter we do not really know the durability; we seem inclined to assume that it is eternal, and severe lessons may be in store for us. Of stone we know what is necessary, and if simple precautions are taken, we can rely on a sufficient eternity.

It must have proven its suitability to the climatic conditions of the place where it will stand. Stone that grew, as it were, in Egypt, must not be expected to stay blooming in North America.

It must not have been quarried by blasting, for that "stuns" it — that is, jars the matrix in which the crystals are packed. It must be sawn or got from the quarry with the new channeling machine.

It must be seasoned; that is, the native water must be allowed to dry out. Buried, it was safe from frost. After exposure and before the moisture has gone, the frost may crack or splinter it. So it must not be built with before that has happened or the danger of it gone by.

And lastly, it must not be laid with its laminae or layers upright. If it is, they will begin to scale off. Laid with these on the flat, they have no such tendency or possibility.

We were warned once not to build on the sand. Perhaps now-a-days we should be warned not to build *with* it even when mixing it with cement — at any rate not to build very high nor to expect eternity. STUDENT

Creation by Sacrifice

A GERMAN, writing to *The Spectator* on the rivalry between his own country and England, applies the law of the survival of the fittest. In the struggle for survival of the fittest, which he thinks must always obtain between nations, that nation will prove the fittest and have the reward of pre-eminent survival whose largest proportion of units *sacrifice* to it, recognize duty to it.

Patriotism is not shouting "My Country," but service of the country or readiness to serve, *at a personal sacrifice*. The amount of this sacrifice and service is the measure of the surviving-strength of the nation. The amount of effort to get something from the state, to get return of honor or cash from service, is the measure of the nation's tendency to go down and decay. If *all* the service is rendered on this basis, nothing can stay the downfall.

The same law applies to any group or society. Its creators, sustainers, and energizers are those who do some or any work for it at a personal cost. Its weakeners, often destroyers, are those who try to get honor or cash from their membership. It has only the amount of life that is given to it, and no perfection of organization can save it if no life is given. But one, two, or three individual lives, thoroughly given, may be effecting the unseen magic of its salvation and energization against the weight of the important-looking figures on the platform. When the days of real aristocracy return there will be some very different assignments of honor. C.

Dolmen de Kerran

THE name *dolmen* is compounded of two Breton words: *dol*, a table; and *men*, a stone. A dolmen consists essentially of several big stones set on end, forming supports or walls; with one or more capstones, usually larger than the uprights, forming a table or roof. The chamber or chambers thus formed are usually entered through a gallery or passage built in similar fashion. When such a covered passage is found separately, not leading to a chamber, it is called an *allée couverte*; in other words, an *allée couverte* is an elongated form of dolmen.

According to archaeologists, all dolmens and *allées couvertes* were formerly covered by tumuli or *galgals*, i. e., artificial mounds, sometimes of huge dimensions, composed respectively of stones, earth, and mud or of stones alone. The denuding action of the elements and the depredations of farmers requiring soil to spread on their fields are the causes to which is ascribed the discovery of most of these monuments.

Some of the larger of the tumuli which still exist enclose several dolmens. Such is the tumulus known as Mont Saint Michel, near Carnac, in which four large dolmens have been discovered; and others are thought to exist. The height of this tumulus is now 65 feet, but must at one time have been considerably greater, as the summit has suffered repeated levelings.

Is Tempered Copper a Myth?

ACCORDING to a professor of chemistry, the idea that copper was tempered in ancient times arises from a thirteenth century misunderstanding of the Greek word *baphé*—a word used by the Graeco-Egyptian alchemist writers of the third century. And he quotes Berthelot to the effect that this word may mean coloring glass, metals, or cloth. Egyptian alchemy busied itself in producing brilliant bronzes on copper. "It would thus appear that copper may never have been tempered after all." This is a more probable conclusion, says an engineering paper, than that the way to do it has been lost.

One was under the impression that the idea of tempered copper rested on the fact that some ancient peoples used copper tools for doing engraving work on very hard stone. It must be presumed now that the authorities quoted above are willing to allow that these ancients used steel. In either case the work was done and still exists, whether wrought

with steel or tempered copper. The belief in tempered copper rests on other grounds than the mistranslation of a Greek word and can not be so easily shattered. Also there are people, of quite good judgment, who will think it more probable that the art has been lost than that it never existed. History presents such stories of havoc that it is easy to believe there must be many lost arts; and our own science makes fresh discoveries every day.

[Since the above was written, a rediscovery of the art has been reported!] STUDENT

Virgin and Child in Ancient Babylon

TERRA-COTTA statuettes representing the goddess Ishtar in various forms, among others with a child at her breast, have been found in the ruins of Babylon by the German Orient Society.

Isis is frequently represented with the infant Horus.

This trinity of Father-Mother-Son is found in all the old theogonies; the Christian theogony (if the Christians can be said to have a theogony at all) is a modification of this trinity. Among Protestants the All-Mother does not seem to be recognized in their religion; but, outside of religion, they have her as "Nature." This secondary religion, with its separate presiding deity, is a very singular phenomenon. The Latin Church has its "Virgin"—a very earthly and degenerated form of Isis or Ishtar.

Our second-rate and second-hand Bible story of the Virgin and Child compares unfavorably with some of these ancient myths;

it is so very crude. If we take it symbolically, it is simply a chapter from the universal book of symbolism, representing the supreme creative Trinity: the Supreme under its twofold form as Father and Mother, and the Son who symbolizes the created universe and also the God in man—the Christos. STUDENT

"Preservation of American Antiquities"

THE Uniform Rules and Regulations prescribed by the act of June 8, 1906, for this purpose, by the Secretaries of the Interior, Agriculture, and War, define the jurisdiction of the United States Government over ruins, archaeological sites, historic and prehistoric monuments and structures, objects of antiquity, historic landmarks, and other objects of historic or scientific interest, and lay down rules concerning their preservation and use. The Secretary of Agriculture has jurisdiction over lands within the exterior limits of forest reserves; the Secretary of War over those within military reservations, and the Secretary of the Interior over other lands owned or controlled by the Government. Permits for examination or excavation of sites and the gathering of objects are issued under certain restrictions to responsible bodies or museums, and these permits are issued through the Smithsonian Institution, to which all reports have to be made. The field officers in charge of United States land must inquire from time to time into relics situated on their areas; and there are provisions for the arrest of vandals, the seizing of relics taken from Government land without a permit, etc. STUDENT

✻ The Trend of Twentieth Century Science ✻

Thought and Movement

MANY people find thought gently stimulated or freed by gentle bodily movement. They get their best thoughts when walking or performing some mechanical duty. Others, whose minds are less under control, rather dread mechanical duty. The thoughts which are liberated or stimulated, are wearisome or undesirable or even noxious. Drudgery is drudgery for this reason; it might be opportunity.

What is the connexion between thought and muscular movement? In one of its parts mind is animal; that is, our animal or sensational part has its mind. It is swifter and fuller and complexer than the corresponding mind of the actual animal because of its close constant association in man with what is altogether higher and other than animal. In the animal there is nothing else at work, so far as its consciousness is concerned.

This mind has been built up in the animal kingdom entirely to correspond with the external world. Each of its changes essentially goes with a muscular movement. The amoeba—a speck of living jelly—is conscious of a touch, and immediately responds with an attempt to enfold the touching object. Becoming conscious that that is not food, it withdraws: that it is food, it goes on enfold-ing. All the way up the animal kingdom, roughly speaking, each change in mental consciousness is due to a sensation, either from within, such as hunger, or from without, such as the sight of prey or the coming forth of the sun; and tends at once to provoke a movement more or less elaborate.

In ourselves, though the case is greatly complicated by other elements, we can see the same thing. Says Dr. Boris Sidis:

The great majority of mankind still leads a life closely allied to animal sensori-motor states. Instance the delight of children in their plays, and the all-absorbing interest of college students in their baseball and football games.

But he goes too far, finally saying in the materialistic vein of the day: "Without motor elements ideational life is arrested." There is, on the contrary, a depth of ideational life that could not be reached except by the entire suspension of the activity of voluntary motor elements. In doing so, man becomes certainly cognizant that he is an incarnated soul. Immediately below this threshold ideation begins to take form in words, first unspoken. But every word in thought is a preparation for a word in muscular action, that is, speech.

The paths run side by side. As every change in the more superficial department of consciousness tends to run out into a muscular action, so muscular action tends to excite this part of mind. And those who are engaged in physical drudgery of any kind know it. Their first course should be to use, not to be used by, the mental stimulus afforded by muscular action, even the turning of the handle of a sewing machine. No small part of the exhaustion, and all the boredom, is due to the freedom given to the mind to wander and rattle all over the field, into memories, antici-

pations, personalities, worries, empty hopes and fears. A little practice in holding it *still* upon something higher than personality, great and tiring though the effort to do so may at first be, will at last make mind an instrument of service, an instrument through which the actuality of the divine soul may be known. That watching soul knows all about the drudgery and knows how to transform it into light. But it can only work in a mind that has been, so to speak, withdrawn from over-close gearing with the muscles. STUDENT

Philosophic Zoology

EARLY in the year Professor Morgan, of Columbia University, thus outlined the zoological situation:

Whether definite variations are by chance useful, or whether they are purposeful, are the contrasting views of modern speculation. The philosophic zoologist of today has made his choice. He has chosen *undirected* variations as furnishing the materials for natural selection. It gives him a working hypothesis that calls in no unknown agencies; it accords with what he observes in nature; it promises the largest rewards.

If the man who regards variations as casual is the philosophic biologist, then it is certainly true that the philosophic biologist regards variations as casual. But, Professor Osborn thus comments upon the dictum of his "friend and colleague":

If the word "undirected" implies fortuity, as I presume it does, it is an interesting future possibility that the theory of the building up of adaptations out of the natural selection of undirected variations, to use my colleague's language, may prove to be a dogma quite as unsupported by facts as the Lamarckian dogma of the inheritance of acquired characters. I long ago pointed out that a very large number of new characters in the hard parts of mammals are adaptive in direction from the beginning; I am very far from saying that *all* new characters are adaptive in direction; I only make this statement as to those characters I have had the opportunity of repeatedly observing.

I now challenge the zoologists to produce a single instance of a series of animals in which adaptive characters are being accumulated through the *selection* of undirected variations, i.e., of variations which are thoroughly mixed up, in which there is *no law evident*. Such a series has never been produced by anyone.

The philosophic palaeontologist, says Professor Osborn,

does not find direction in the old teleologic sense, but quite as certainly he finds no evidence of such fortuity as will justify the use of the word *undirected* as furnishing materials for natural selection. . . . Consequently he assumes the agnostic position that there is some principle, or principles of direction, or better—to use Professor Morgan's own words—"unknown agencies," still to be discovered other than the principle of order coming out of fortuity.

The new position in its fuller form is that permanent variations, "mutations," are definite steps in evolution; the only requirement that nature makes of them being that they shall at any rate not make the possessor of them *less* adapted to its surroundings. And there is no evidence that any of such variations ever do. Their cause is unknown. Their appearance, unlike that of the other sort of variation, is not traceable to changes in food supply or

environment. They come cyclically, a species sometimes remaining fixed for ages and then suddenly liberating them in great numbers, this productive period being again followed by quiescence. The modern view is that they are the external manifestations of an advance step taken by the inner life of the creature, and that such steps are not blindly taken nor undirected. But of course they are exceedingly small. STUDENT

Life and Fermentation

BIOLOGISTS are in some difficulty as to a definition of life in terms of its functions. To try to define its *essence* is of course as difficult as in the case of time, motion, consciousness, or any other ultimate. The would-be definer is himself what he would define. *The subjective in action* would be as near to a definition as we could get.

But the physiological functions of living units are often so similarly performed, or so closely imitated, by such inorganic units as crystals or specks of colloid that it is convenient to find one neither performed nor imitated.

May not this be the production of ferments or enzymes? These are chemical bodies of so-far unknown constitution which, remaining themselves unchanged, excite fermentation—a very comprehensive word—in other substances. The yeast cell, for instance, secretes a ferment which changes sugar into alcohol, carbonic acid, and other bodies. The stomach cell secretes pepsin, which changes insoluble albumens into soluble peptones, itself remaining unchanged. How the ferments manage this is not known.

But cells secrete ferments which act not only on substances outside them, but on those within. It seems more and more probable that every cell or unit organism consists of two parts or elements: the part essentially living, which produces the ferments; and the adventitious part that comes and goes, that is woven temporarily into the strands of the living stuff, made to do work, wears out, and is got rid of. The intermediaries appear to be the ferments, which are of many kinds. The assimilation of the adventitious part, all its activities whilst it is a part (the activities that are regarded as constituting the life of the cell), and its final excretion—are done under the direction of the ferments, themselves produced by the truly living part. And this living part may be ultra-physical.

It was thought that ferments always caused retrogression of the substances upon which they acted, into simpler ones. It is now known that those same destructive ones under certain circumstances will reverse their action and build up again what they have picked to pieces. The same being doubtless the case with those that act entirely within the cell, they are agents both of the life and death process.

So a temporary definition of life from the side of its physiological functions would be: That unit entity in a cell under whose supervision ferments are produced, the ferments being the intermediaries through whose work the physiological functions are carried on. C.

Nature

Studies

Weasels and Rats

OFTEN we find instances of the short-sighted killing of destructive creatures resulting in worse destruction owing to the fact that these creatures have done more good in keeping down some other pest worse than themselves. Now it is the weasel for whom a plea is made. He keeps down the rats which are such a serious plague. He may make inroads on the poultry yard, but that is only his payment for the good he does in slaughtering the rat. One is always glad to hear of some reason for avoiding slaughter, for slaughter is a violent inharmonious method. With the morals of the weasel we need not concern ourselves. T.

Ice on the Mersey

SELDOM is ice to be seen on the Mersey at the port of Liverpool, but during a very severe winter the river changed its usual aspect, and masses of ice partly covered its surface. While not enough to interfere seriously with the great traffic of the port, salt-water ice was so unusual a sight that thousands of people flocked to see it. Under the temperate climate of England the unusual condition did not last long, and soon the river resumed its normal appearance under the still gray sky of winter.

Destruction of the Earth

INEVITABLE destruction, by one of four possible fates, awaits this earth and all its inhabitants, according to a well known astronomer. A tramp star may strike us and grind us to powder, or we may ride full tilt into the sun and be turned into a puff of incandescent vapor, thenceforth playing no more important rôle in the universe than that of an absorption spectrum for the Martians to look at and speculate about. Again, tidal friction may strangle the spinning of our terrestrial top and cause it to be overdone by solar heat on one side and underdone on the other, like a joint on a run-down roaster. This, we are told, has already happened to Mercury and Venus; but, in the case of

Lomaland Photo. and Engraving Dept.

SALT-WATER ICE AT THE MOUTH OF THE MERSEY, LIVERPOOL, ENGLAND

THE MONARCH OF THE SOIL

I MIND me of an old Corycian swain,
Who from a plot of disregarded plain
That neither corn, nor vine, nor olive grew,
Yet such a store of garden produce drew
That made him rich in heart as kings with all
Their wealth, when he returned at even-fall.
And from the conquest of the barren ground
His table with unpurchased plenty crowned.
For him the rose first open'd; his, somehow,
The first ripe apple redden'd on the bough;
Nay, even when melancholy Winter still
Congeal'd the glebe, and checked the wandering rill,
The sturdy veteran might abroad be seen,
With some first slip of unexpected green.

Edward Fitzgerald

which Occultism can not share. For Occultism teaches that intelligent Law rules throughout the universe. And this view is gaining ground so rapidly, even in science itself, that it will not be much longer that we shall have to combat the older view. The notion that the universe is abandoned to the mercies of blind dynamic laws not only offends our sense of consistency and fitness but is being shown to have no basis in experimental science. For science is unable to discover anywhere the alleged blind forces or the supposed dead matter. That mysterious power which binds the revolving orbs to the centers of their orbits is utterly unknown to science except by its effects. Because it causes bodies to draw together, it is called "attraction," but what it

is, is not explained. Nor can it be explained by any mechanical symbolism. The movements of the heavenly bodies, time to exactitude, are governed even now by intelligent Law, and there are no tramp stars destined to strike us by "accident."

Yet it is a teaching of Occultism that there will be a *Pralaya*, or period of universal rest, which will be preceded by a gradual withdrawal of the life-forces of the world and a gradual running-down of its activities. For the law of ebb and flow is universal, nor are worlds exempt from it. But this is very far ahead and man will not then be what he is now. There are many more data for Science to collect, before it can have enough basis on which to found conclusions about the final fate of the earth. E.

Scientific Theosophy

(A Lecture delivered at Isis Theater—II)

IS it unreasonable, then, that any teacher able to impart instruction should first require of his prospective pupil certain safeguards, certain preliminary tests, such as are required of people entering the army or the medical profession? It is most eminently reasonable and necessary; and so, when an aspirant approaches a Theosophical teacher or organization with such a request, he naturally meets with the answer: "You cannot be accepted as a pupil until you have complied with the conditions the Law compels us to require of you. We received our knowledge under such conditions, and under such conditions alone can we impart it. To accept you under any other conditions would be a grave injustice to yourself, to whom we owe protection from the evil consequences that would ensue. If you wish to take the higher courses, you must begin with the lower; after that, if you prove successful and competent, we will see about the further instructions."

Ordinary physical science does not require any very special preparation for its pursuit, because the powers dealt with are such as ordinary men can control. But the higher science of which we are speaking involves the use of subtler and more potent forces, such as would overpower any weak nature; and, from this point of view, all ordinary people are weak. The magician has to arouse certain forces within himself, forces which ordinarily sleep. If these were aroused in the ordinary individual, he would find himself confronted by new and powerful temptations which he would be unable to resist, and he would succumb, as so many have done. Suppose, for the purpose of argument, that I could teach you occult powers and were willing to do so, what could I do if you deliberately refused to follow my instructions? If you said: "I do not want to do it in that way; it is too hard; show me an easier way," what could I do? Or if a chemistry pupil insisted on being given the most dangerous chemicals and going off and mixing them up on his own account without stopping to learn, what could his instructor do?

Not only is it inadvisable to attempt to teach people more psychic mysteries until they have first acquired a better understanding of their own nature and a better control over it, but humanity has already some arrears to make up in the way of learning self-control. Hence the Science and Art of Right Living is the

first and most important thing to learn. To him that hath this, shall be given; but from him that hath it not shall be taken away even that which he hath. Seek ye first the kingdom of God and his righteousness and all these things shall be added unto you. But without this prime requisite we cannot retain any powers which we might prematurely acquire.

H. P. Blavatsky said that Chemistry and Physiology were the two magicians of the future, destined to open the eyes of scientific men to the truths of Occultism. The main thing which these two sciences would reveal was that the whole universe, the so-called inorganic as well as the so-called organic, was made up of minute "lives," and that there was no dead matter, no blind force, anywhere. And since she wrote this, many discoveries have tended to fulfil the prophecy.

Theosophy has always maintained that life and consciousness were the fundamental factors in the universe, and that the study of Mind is therefore the first step. To begin with the study of matter is to begin at the wrong end. By that method of observation we can only discover in matter a collection of properties and qualities, but cannot find the reality that underlies them. Our physical senses, by which we observe matter, are themselves very limited in their scope.

So Occultism begins with the study of mind. Its material is human nature itself; its laboratory is humanity. The first step is self-study, self-culture. And the first requisite is health and balance of the faculties. Without these the study would be like a scientist using dirty instruments and impure chemicals. But we find that people are rushing blindly into this study without attempting to go through any such preliminaries, a course which can only result in an increase of nervous diseases, subtle vices, and insanity; and instead of bringing the desired knowledge, it will only bring deeper delusion. If we desire to penetrate beyond the veil of matter, we must have the strength to resist the terrible powers that guard the portal.

In ancient allegory the way to the treasure chamber is always guarded by a dragon which has to be overcome. That dragon is man's own passions. The force that binds us down on the plane of materiality and shuts us out from knowledge and freedom is the force of our own passions. The attempt to force one's way into the inner regions without having gained the strength to master this dragon results in a quickening of the passions and in our falling a victim to their intensified power. That this is no idle threat, but a serious reality, rests not only on the evidence of students who have been intimately connected with Theosophy for more than twenty years, but on the testimony of facts that are daily coming to notice.

The science of self-knowledge and self-control is the great practical fundamental science that interests the members of the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY. And, strange paradox, to acquire self-control, one has to learn to forget oneself. For the personal self is the great obstacle in Occultism. The student is trying to bring out in himself a higher Self than the personal self—he is trying to find the Master, the Christ. Hence he devotes himself to impersonal work in the interests of the great cause of humanity; and in proportion as he succeeds in that does

true knowledge come to him without seeking.

It may be an unwelcome truth for some, but it is a truth, that knowledge is not a personal possession. As well might one attempt to isolate for one's exclusive use a portion of the free air of heaven, or the golden sunlight. Like these bounties of nature, any knowledge that one might attempt to isolate would go bad and turn to poison. Knowledge is free to all; it must be shared. The purpose of Theosophy is to aid men in setting themselves free from the trammels of their selfishness and passions. To attempt to teach occult powers without the preliminary of self-purification would only be fastening those chains tighter upon them. And this, Theosophy will never do.

The voices of those who try to persuade you that you can find any knowledge by an easier road are the voices of the hucksters in Vanity Fair; they will lead you to your own destruction. Theosophy proclaims that the only true road to knowledge is the old old one—the road of Duty and Self-forgetfulness.

The UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY cannot be otherwise than friendly to all science, so long as that science is true to its name and follows the Truth. Theosophy has naught to fear from the facts, is not afraid that any scientific discoveries will contradict it, has no interest in discouraging true scientific research. It is only dogmatism, selfishness, and other abuses of knowledge that Theosophy combats; and in doing this it is aiding the cause of Science and championing its honest devotees.

H. T. E.

Balance

THERE is no nation in the world that stands complete within itself, not requiring what others can give it. While each must develop its own keynote and particular excellence, all should remember that no good quality can shine in perfection, while any other good quality remains in abeyance.

Practical ability to do things on the physical plane is an acquisition without which there can be no national greatness; yet what dangers threaten the practical people who neglect idealism and imagination. They stand, like the man in the parable, to have taken away from them even that which they have. Their eyes are turned on material things, and these assume an undue importance, filling their whole vision. Among races so afflicted, the materialism is likely to give place to sensuality and luxury, by which at last all practical ability is rotted away.

It is not that a materialist is therefore a sensualist; but that thought which maketh a man is ever on the move, in whatever direction it may be given; changing itself in the course of years beyond recognition. Materialistic thought fixes attention on the physical nature of man, sets like a tide towards that and populates it with the mind; and the physical man has a demon within itself, apt to make its demands heard. The Romans were the great practical people of their time; yet they came to lose command of all material things through a certain neglect of imagination and idealism, which led them by easy stages into splendor, corruption and ruin.

On the other hand, the world slips away from the mere dreamer, his dreams become of less and less import, and squalor grows up around him.

Humanity is of all sorts and conditions, all

necessary and admirable in their pure state. The perfect man has every part of his nature balanced and evolved: he does not depend on nor imitate others, but draws every shining quality out of his own soul. All good seed is in the soul of man, waiting to be brought to perfection. Those who only dreamed shall *do* gloriously; and those who, without illumination, *did*—their doings shall be made splendid with the most exalted dreams in the world.

STUDENT

THEOSOPHICAL FORUM

Conducted by J. H. Fussell

Question Theosophy teaches that man is destined to lift the rest of creation to the highest planes of consciousness. How is this possible? How can man affect for good the animal world?

Answer One has to understand the unity of things. You could take no phase of existence from this universe, and leave the rest intact; in reality there is only one being, and that contains all. A man is a pattern of the whole cosmos; he is a world in himself, and from the study of him you can come to realize a little the nature of universal being.

There is his body, for instance, with a population of living beings as great as that of a world. Every cell of it is a sept, every organ, perhaps, represents a race or nation of multitudinous and ever active atomies with their own consciousness and work to do. Of these myriad consciousnesses the unit consciousness of the body is composed, and we find it affected by them, and broadly ruling them in its turn. Science knows of these nations, with their warfares, their liability to invasion, their activity and even heroism in defense.

Then, as in nature, there is an animal world in man; there is nothing bestial but is represented in him; dormant in its worst aspects for the most part; but here and there showing a head to outdo the fox, the weasel, the tiger, or the pig. And whatever there is in any man, there is also latent in all of us; if not, it is because we have sterilized the seeds of it by patient labor towards self-conquest. Man is in touch with the animal kingdom through passion; desire is the soul of the animal; and desire is a very active principle in man.

Above the body and above the desires stands the mind; and above that again, that which protests when the mind leans towards evil, and seeks to attract it towards noble and spiritual courses. Here we come to that old question, what is the nature and meaning of evil? Theosophy supplies the true definition; it is the downward tendency of the mind towards desire, selfishness, and the animal kingdom in man.

Now here within us is the soul, that star out of heaven, the fountain of all inspiration and nobility, the unassailed warrior and pilgrim of evolution; camped in one dwelling with a brute, the animal man. They cannot come into direct contact, as one can very easily see for oneself; the noblest aspirations and the basest lusts cannot hold you at one and the same moment. Between them is the mind that we know so well, our everyday thinking selves for a buffer; which mind is the son of the soul; a ray shot out from the serene soul,

and incarnate among the desires and limitations of the body. By aspiration the mind may re-become one with the soul. It has all the potentialities of soulhood and godhood within it; so we see occasional godlike men walking the earth, the Jesuses and Buddhas of history. Or by alliance with the desires it may create a state of things worse than any in the animal kingdom.

Animals live naturally their life of desire, and seem to exercise no wilful choice towards evil. A cat playing with a mouse differs from a Torquemada playing with his victims; the first is animal, and the second devilish; the first irresponsible, the second the exercise of a mind made one with hell. The cat enjoys her fierce pleasure, and offers no excuses; the vivisector and the inquisitor pour the stuff of thought into their doings, and prate of religion and the interests of science. There we have the difference; though there is also a strange similarity in the *methods* of all three.

We cannot dwell apart mentally, any more than physically. Health and ill-health are infectious; we are always throwing one or the other of them off from our bodies. Not a thought passes through our minds, but prints itself on every atom of our physical being. Glutinous pictures form in your imagination, and all the cells of the stomach and palate start an agitation after food. The thing is awakened in every molecule of them, and leaves it grosser, more animal, baser than it was before. As when a man rises up to broach some new idea, and proclaims a doctrine, say of national greed or corruption; inveighs against a neighboring country, and starts his countrymen clamoring for war, the whole nation takes up the furor; we have seen it done more than once in our own time; every man's thoughts for the time being are grossened and debased. We send currents down through the cell-life of our bodies, and have their evolution and morality in our own hands.

And they are always coming to and going from us; our bodies are no more than ideal forms to which populations of atoms incessantly gather, to take the place of other populations incessantly retiring. By our thoughts we determine the character of our immigrant and emigrant atoms. Spiritual thought draws to us hosts of that nature, and spiritualizes hosts at the point of their departure. Spiritualized atoms so drawn to us, are again an assistance to our own evolution; they affect the general consciousness of the whole body, which affects the consciousness of the mind; there is a constant action and reaction between all the parts of our being. From this fact comes the whole importance of environment. In pure surroundings we have less to fight; or greater opportunity of meeting and quelling once for all the whole of the evil we may have gathered in all our lives.

Now where do the atoms go when they leave us? Nature is made of one stuff; all substance is composed of the same atoms in different rates of vibration. They go to like places with the nature we have imposed upon them. They are our missionaries and ambassadors to the lower kingdoms of nature. No doubt we have planted cruelty and all other vile features in the animal world. No doubt we are the only responsible ones. Nature, as you may say, invented the urge of desire that

is in them; we, mixing mind with the desire currents, invented whatever partakes of the demoniacal or debased. No doubt we ought not to say that a man is hoggish, or apelike, or tigerish; but that the tiger and the ape and the hog are very human in their qualities, and nearly influenced by man.

So of course we have the burden of the world on our shoulders; we are Atlas, and carry creation. At least, it is our destiny to do so; we do not carry it yet; we blunder and stagger; fool and loiter by the wayside; leave our charge to its own devices, roll it pitifully in the mire. We must not wonder then, if it is all botched and foul; we must not complain if it breeds fever and venomous things. As we purify our lives, and come to be human, we shall see a change in the animal world. Isaiah was not so far wrong when he wrote that about the lion and the lamb.

STUDENT

Question May it not be true after all that what we often take for intuitive knowledge (for instance, the sense of certainty of an after-death life—or lives—and reunion with those we love) is indeed but an echo of our hopes and desires?

Answer An answer was given to this question in the *CENTURY PATH* for June 27th, and in reading it one or two other points have occurred to me that may be helpful to others. Putting the question in other words, does it not mean that we doubt our deeper feelings, our intuitions, our real knowledge, our inmost and most sacred aspirations? Why should this be so? When we look closely at the matter does it not mean that we have given an altogether false and exaggerated value to what we are pleased to call knowledge, and what we regard as certainty?

What are the tests, limitations, boundaries, which we presume to apply to knowledge, and by means of which we separate knowledge from conjecture? Are they not in the last analysis the physical senses, physical consciousness? Because we see, touch, taste, smell; because we can weigh, measure, analyse, by physical and chemical means, we say, therefore, we know! And yet on the other hand, in the realms of matter, with all our apparatus, we continually find ourselves deceived, and more than anything else do our senses deceive us.

But we cannot apply these tests to our "intuitive knowledge," our feeling of certainty of an "after-death state." In heaven's name, if we have the feeling of certainty, rooted in the depths of our being, why do we need to apply tests to it? And why should we wish to do so? A loved one passes, after a long period of intense suffering, and the first thought is for our friend, one of rejoicing, that he is now free from pain. We don't stop to argue, we *know*, but afterwards, fools that we are, we begin to *reason* and to doubt, because we cannot apply our *tests*. Oh, how we cling to those deceivers, the physical senses, but knowledge does not reside with them.

What does Theosophy say? Hold your love to yourself and you will lose it; let it flow out in the loving service of others, and you will find at last that which you are truly searching for. "Self-knowledge is of loving deeds the child," and self-knowledge includes all other knowledge.

THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY

FOUNDED AT NEW YORK CITY IN 1875 BY H. P. BLAVATSKY, WILLIAM Q. JUDGE AND OTHERS
REORGANIZED IN 1898 BY KATHERINE TINGLEY

C e n t r a l O f f i c e P o i n t L o m a C a l i f o r n i a

The Headquarters of the Society at Point Loma with the buildings and grounds, are no "Community" "Settlement" or "Colony." They form no experiment in Socialism, Communism, or anything of similar nature, but are the Central Executive Office of an international organization where the business of the same is carried on, and where the teachings of Theosophy are being demonstrated. Midway 'twixt East and West, where the rising Sun of Progress and Enlightenment shall one day stand at full meridian, the Headquarters of the Society unite the philosophic Orient with the practical West

Immortality

THE question of immortality is being considerably discussed; but the inquirers err in grasping too far and skipping preliminary details. It is obvious that before we can even frame the question intelligibly, we need to know much more about consciousness and other factors in man's make-up.

Most thinkers, too, seem to have ignored the important fact that we go to sleep every night. Would it not be as well to study the philosophy of sleep first, and postpone the attempt to reach a definite conclusion on the subject of death? What becomes of the personality during sleep? As far as we can make out, the personality is dissolved, without the continuity of *individual* life being annihilated. If this be so, it proves that *personality* is not an essential part of our life and that its perpetuation is not a necessary condition of immortality.

The whole question turns on the meaning of personality, identity, memory, and such things; and so little do we know about these, in our modern philosophy, that we cannot solve the problem of immortality in the terms of modern parlance. The Individuality, the essential man, has lived before; but the personality, an accretion built up since the last birth, has not; we are conscious of the mortality of the one and dimly prescient of the immortality of the other. The mysterious process of evolution by which the human mind is brought into rapport with its Divine counterpart, thereby becoming conscious of its immortality, constitutes the riddle of the Sphinx, the eternal problem of human life. It has to be solved practically by each Soul in the course of its evolution.

The ability to put the question, "Am I immortal?" seems equivalent to an affirmative answer; and it seems essential to all reasoning on the subject that we should first *predicate* the immortality of the Self. But equally must we infer the transience of all mere qualities of the Ego—including the personality. Does this mean complete "absorption" into the deity, or loss of individuality? No; but the import of the words "Ego" and "Individuality" can hardly be defined in the terms of ordinary thought.

May we not reasonably anticipate that as we progress in self-knowledge such problems will acquire a clearer meaning? STUDENT

MEMBERSHIP

in the Universal Brotherhood and Theosophical Society may be either "at large" or in a local Branch. Adhesion to the principle of Universal Brotherhood is the only prerequisite to membership. The Organization represents no particular creed; it is entirely unsectarian, and includes professors of all faiths, only exacting from each member that large toleration of the beliefs of others which he desires them to exhibit towards his own.

Applications for membership in a Branch should be addressed to the local Director; for membership "at large" to G. de Purucker, Membership Secretary, International Theosophical Headquarters, Point Loma, California.

Thoughts in a Library

ROW upon row, case upon case, of books; beautiful books. History of every race and clime; stories and legends of every age, all beautifully illustrated and told in fascinating language. The world's best literature, in sets of many vast volumes, luxurious editions. Biography, geography, all the sciences, art, music, poetry, travel, adventure. Each one of these multiplied innumerable so that the brain reels with the effort to select.

And how much better educated is the world with all these books than it was before? If it be better educated, there must be other reasons for it than this vast multiplication of books. They have been multiplied out of all proportion to the possibility of using them. A very few out of the lot would be all that could possibly be needed. The quantity produces an effect as of being overwhelmed. There is the desire to know all the contents of all the books, coupled with the sense of utter despair of ever being able to do so.

But there have been a few rare temperaments that have been able to absorb book after book with lightning acquisition and indelible memory; prodigies that one hears of. And what good has it usually been either to them or to anyone else? Are such numbered among the wise and great? What would it profit me if I should spend the remainder of life an omnivorous student, amassing information about every race and clime, every science and every literary masterpiece? What should I be like at the end? Should I have solved any of the problems of life?

What is education? In our schools we suffer from this same plethora of materials and machinery. Take up a school-book catalog—no, you cannot do it; catalogs do not go in ones, they go in bunches. Take up a bunch of school-book catalogs and try to select. There is the same sense of hopelessness and bewilderment. In a vast museum one is overwhelmed with the multitude of objects, case upon case, room upon room; and one wanders vaguely

about, with roaming eye, seeing nothing and going away soon with an attack of museum headache. Everything is multiplied in the same way; stores in a town, music in a concert, drugs in a drug-store. A hungry man, who has been doing hard work, wants one plate and one spoon and some good solid food right before him; he does not want an elaborate banquet with every eatable under the sun spread out.

These endless rows of sumptuous volumes are a faithful image of the condition of our culture; all externals and but little of the inner strength. The really able man is he who carries his apparatus about with him in his brain-box. He who has his body padded with sound flesh is surely better equipped than he who has to have every chair and bed he encounters padded. All our drugs should be in our own body, not on the apothecary's counter. Knowledge, as Browning says in *Paracelsus*, is rather a letting out of the imprisoned splendor from within than a shedding of light from some outside source.

The Western doctrine that knowledge is built up piecemeal by patient accumulation, is in marked and invidious contrast to the Oriental doctrine that knowledge is present in its entirety in the depths of the mind. The Western system has been compared by Marion Crawford in one of his novels to going up a series of ladders, each ladder representing some branch of study; the Eastern method consists in ascending a lofty mountain, from whose summit a comprehensive view of the whole field of knowledge can be obtained.

The real end of education, then, is so to train the faculties that they can command knowledge at will without the aid of all these external resources. And as a matter of fact, we recognize this; for is not the art of reading preliminary to the use of a library at all? Would any quantity of books be of any use to one who could not read? Arguing along this line, we see that books will be more or less useful to the reader according to his power of grasping what is in them. And where are we to stop in the argument? Perhaps some man may be able to take a book and get out of it all that he needs in a minute or two. Perhaps, even, there may be minds for which it is not necessary to read a book at all. Books contain the printed record of ideas; ideas

(CONCLUDED ON PAGE 12)

THE THEOSOPHICAL ADDRESS AT ISIS THEATER

LAST Sunday Mrs. Marjorie Tyberg read a very thoughtful paper on "The Lost Chord in Human Life," at the regular meeting conducted by students from Point Loma. A large and attentive audience listened to the address and the excellent music provided by the Râja Yoga quintet with evident pleasure and appreciation. The following extracts are from Mrs. Tyberg's address:

"Looking back over the centuries of the Christian era it seems unthinkable that human beings, possessed of the most remarkable faculties that make their humanity, should be content to know so little about the most vital questions concerning themselves and human life generally. . . . It was as if a certain chord had remained unstruck, and a certain part of the nature had remained dormant, waiting, waiting until the cycle of weariness and gloom should have rounded out its appointed years, and a time should come when, throughout the world, should sound once more the lost chord, ringing out the old, ignorant, cramped conceptions, and ringing in a time of dawn, of hope, of awakening of the slumbering spiritual faculties to which alone could the truth appeal. . . . H. P. Blavatsky struck it first when she brought Theosophy; William Q. Judge awakened many by the harmony of wisdom and work for brotherhood; and Katherine Tingley is teaching the students of Theosophy to make lives of compassionate service, chords of challenge to Souls everywhere, awakening in old and young the desire for and the love of ancient wisdom, the ancient wonder and sweetness and the beneficent power of the soul life on earth. . . .

"If Theosophy is the chord of human life lost during the Dark Ages, the teaching of Reincarnation is indeed the lost chord of Christianity. . . . It is over thirty years since H. P. Blavatsky began her bold revival of this teaching of rebirth, and many students of Theosophy have had the opportunity of testing the power and beneficent influence of the conviction of its truth. . . .

"There is in much of the human race an inherent desire to outwit and surpass others. This is at the root of much of the humor which people revel in, and much of the conflict in human affairs, petty and important. Most people have yet to discover that the greatest sense of satisfaction is obtained from the outwitting of the desires and schemes of their own lower natures. . . . It is time for each one who has felt the thrill of new interest, new enthusiasm, awakened by these teachings, boldly to face whatever in his or her nature is hindering a full response to the challenge. It is a very curious fact that what men and women have sometimes prayed for, they do not recognize when it presents itself. We bemoan certain conditions, we assert that we long for better things, that we have ideals so much higher and purer than our surroundings can be made to express; but though in such a movement as the Theosophical, we see the actual possibility of creating the highest conditions among mankind, some still hesitate to do anything more than talk about ideal conditions. . . . Why not ring true? Why not set to work to attune your nature to the teachings of the Soul and of Brotherhood and make of your life a challenge to others?" OBSERVER

Synthesis and Analysis

THIS world is a great warfare, and we are in the thick of tremendous fighting now: would to Heaven we always recognized friend from foe! One is often astounded, in following current events, at the poison that is being poured into the air we mentally breathe; at the lies that are being told in the name of Truth, to rob man of the vestiges of his glory and the best memories he has. What is Truth, after all? In which direction shall you seek to find her? There is the proverb about "the bottom of a well"; that is no excuse for scouring the sewers for her. Remember also "the Truth shall make you free." Truth is that which makes us free; seek her then, in whatever place is inspiring and rings with nobility. We need not search the well-bottom, except for the reflection of the stars. Man needs to gather into his mind the big and beautiful ideas, for they are the true ones, and the ones that tend towards freedom. Truth is not that meaningless sterility that one arrives at, too often, by analytical thought; but the inspiration that crowns and ensoles synthetical modes of thinking.

We have no right to give such a divine name to kinds of knowledge (so-called) that pauperize and deflower the universe for us. There is a rose; the truth about it is a certain synthesis of form and scent and color; which things together express a phase of consciousness, that is, a living soul. We could not tell so well, of what likeness is a certain part of our being, were there no roses to image it; for all the truth there is, is also within ourselves, and the summit of knowledge is self-knowledge, which leads to self-mastery and the advance of evolution. We have forgotten the purpose of knowledge; which is to be acquired not that we may *know*, but that we may *be*. That is the point: that we should go forward, that grand ideas should have entry into our minds; that our imaginations should embrace magnificence, and grow mighty upon the food of the gods.

The red rose of all beauty speaks quite simply of the flower and richness of humanity to which we may attain; that glowing forth and shining on the world, and perpetually giving out profuse, unmarketable compassion; wealth spiritual, unconfined, ruby-hearted, profuse. Analysis may attack, but cannot destroy such a conception. That crimson of infinite depth is not to be denied. Analysis must always find bottom somewhere; but where are you to find bottom here? Pluck the rose petal from petal, and label every torn fragment of her; lay bare the secret of her scent, seize upon her coloring matter; tell us all that can be told about her, the most complete analysis; and it remains that you have given us much about her, but not herself; of *that* we were in possession before. The truth of a thing is the being and significance and *human* value of it; nothing is worthy to be called true, unless it has some kind of trumpet-call for that long-slumberer, the soul.

True, analysis is not without purpose. It has its minor part to play; but Oh, how we have run it to death! You may analyse for the sake of synthesizing after. You may hot-anize on the rose, not to explain away her glory, nor to rid the earth of a prime treasure; but to learn a lesson from her methods, and to see her consciousness at work. In that

case you must bring a certain attitude to the doing of it. You must take your goal with you, so to say; for analysis will not, of itself, lead you to any decent or reasonable goal. It will show you the elements combining and commingling, but not that moment when the soul steps in to assume control. Indeed, its whole tendency will be, so to glue your eyes on those elements, and cajole you into thinking them dead and unintelligent, that you shall not only miss the one fact that counts, but be depolarized from it altogether, and conceive an antipathy for all beauty and soulhood. The goose will no longer lay you golden eggs, when greed or curiosity has impelled you to kill her.

History must be studied in the same way, synthetically; or it had better not be studied at all. It is not truth that tells me that Scaevola never held his arm in the flame, nor Curtius leaped into the pit in the forum. The *truth* is, that such things may have been done by men at any time, by virtue of man's latent heroism; and further, that they were believed in in old Rome, believed in and loved; and this shows what were the ideals of the people. They had their minds on fortitude, self-sacrifice, patriotism; and glowed over any Roman who manifested these qualities. If that glow had been preserved Rome would never have fallen; for you cannot love nobleness without being a little noble yourself. Grafters and corrupt politicians could never have imagined a Scaevola. The story shows that Rome was equal to such an imagining; and therefore, we may safely argue, to such a deed. And if Rome, then why not we ourselves? As we are human, we share in the heroism of all heroes.

STUDENT

The Churches

"The Church Must Lead"

In these days of democracy the people are, after all, the real rulers. The people are restless, the laws changing, and it remains for the church to take the lead. . . . If the natural and ordinary methods of church work fail, let's try unnatural and new methods.

FROM the reported speech of a bishop. He said that the church was not now a mere place for the saving of souls, but one where men and women were made to lead consistent Christian lives; the principles of Christ could alone solve social problems.

But if the church is what it is here claimed to be, why does it *not* lead? Or is the important point that it should lead in any case, if not by one means, then by another?

Canon Repudiates the Scriptures

Inspiration is not now allowed to certify to the truth of any statement in the Bible which cannot be substantiated at the bar of reason and evidence.

Reported utterance of a canon of the Church of England. It is a sad give-away and will be very inconvenient for other prelates. This man is a Canon of Westminster, so his statements have a weight as representing the voice of authority and authenticity. But the Church of England has been celebrating a great pageant of church history, with the object of familiarizing people therewith. Can it be giving up the Bible in favor of historical precedent, as its sheet anchor?

Is the Press Irreligious?

A well-known editor, writing on "Journalists and the Church," comments on the remarkable absence from journalism of any reference to the existence of a God or to belief in a

future life, and says that this estimate of the non-existence of Christianity in Christian institutions is largely endorsed by the Church itself.

Is it not evident that ecclesiasticism is not the real religion of the times, but an exotic? The people have religion, the press has religion, but it has little or nothing to do with the churches. After all, religion is the science of life, and the experiences of the human Soul go back of all creeds and churches. Ecclesiasticism is an organizing governing spirit that endeavors to formulate and control the spirit of the times.

The people are not irreligious; but they are changing their formulas. The stage of breaking with the old before the new is ready is painful. The sanctions of religion are always found in the heart and understanding. The voice of "God" speaks through the conscience—not so much the individual conscience as the collective conscience. But, while metaphysics may interest the comparatively few, the many must be addressed in a voice they can understand. They must be shown where their true interests lie. At present they are in confusion on this point. They recognize solidarity as being the basis of welfare, as being an essential condition of human life—a truth which has dawned upon them quite independently of ecclesiastical influences, for the churches have followed, not led, this movement. This is the beginning of a new religious life. But there is endless confusion as to the import and application of the new message. Political or social collectivism is one of the aims blindly striven for. The old teachings of the churches about a life of abnegation of the institutions of modern life, supposed to be the gospel of Jesus, are confounded with the new aspirations; and Tolstoyism represents brotherhood and quietism as inseparable.

If solidarity, therefore, is the new religious spirit, the question is how to render it practical, applicable to daily life, useful to the people. The actual basis of solidarity is the spiritual unity of mankind; and neither religion nor science afford any means of formulating this. Science has shown us a good deal about our unity and mutual dependence in lesser matters, such as health and disease; and its inventions have brought about an actual unification and interblending of humanity which has compelled us to give attention to the question of how to adapt ourselves to each other. But more than this is needed; the physical life of man is not the most important part of his life. Religion tells us of the common fatherhood of God; but then God is too faint a conception for his fatherhood to inspire us with a feeling of brotherhood to each other. *We need to find the God in our own hearts.*

What is required is teachings as to human nature that can make the inner life more of a reality—teachings both theoretical and applied. These Theosophy can give; it can rely on the verdict of experience.

Presbytery Ordains Heretics

THREE young men, says a report from New York, who frankly denied the old beliefs of the Presbyterian Church, were admitted and licensed as ministers of the faith at a meeting of the Presbytery. They had been rejected at the first meeting, at the second meeting their licenses were withheld, and it was not until

the third that they were accepted. The questions and answers included the following:

Do you believe that sin was transmitted to all mankind by the passage of the apple from Eve to Adam in the Garden of Eden?

No; we interpret that part of the Scriptures as entirely allegorical.

Then you do not believe literally the part of the Scripture relating to original sin?

No; we believe that man began with sin.

Do you believe in the divine birth of Christ?

We believe that Christ is the only Savior of mankind; we believe in His divinity; but we do not accept the literal Scriptural interpretation of his birth.

Do you believe in the Scriptural narrative of the resurrection of Christ?

No; we believe in His spiritual resurrection, but we cannot accept the belief that He rose in the body from the tomb.

The position of this church, after such a formal and unequivocal endorsement of heretical views, is most peculiar. The only figure of rhetoric adequate in describing it is aposiopesis.

The allegory of the apple symbolizes a certain stage in the progress of evolution, when man acquired the discriminative faculty spoken of as the "knowledge of good and evil." If some of the human race abused this sacred power and turned knowledge to sensual and materialistic uses, that transgression has impaired the character of their descendants and brought upon us the long reign of spiritual darkness which the pages of history record.

But the churches omit to point out, or do not themselves understand, that man still possesses that Divine gift and can retrieve his past mistakes. The real story of the "fall of man" includes the promise of his resurrection; for the very knowledge he misused must be his ultimate savior. It was a Divine gift that he received. To replace this denial of man's power to save himself by calling upon his own Divinity, ecclesiasticism has contrived the machinery of special intervention, grace, and intercession.

It is not stated to what extent the candidates believed in the "historical" Jesus; but, as they rejected the Biblical accounts of his birth and resurrection, they could not have much ground for accepting the other parts of the narrative. We have to bear in mind that the word "Christ" means two things: the Divinity in man, and an initiated Teacher. The doctrine of the Christ is common to all great religions; the crucifixion, resurrection, etc., in Christianity being allegorical of the drama of the Soul in the flesh. Whether or not there was an actual Jesus is a comparatively unimportant question; certainly, however, the man and his life were very much misrepresented after his departure. H. T. E.

Rustless Iron

CHEMISTS in the past have been contented to regard chemical action as taking place between atoms in obedience to "affinities," and to accept these affinities as essential properties of the atoms, without inquiring too closely into the nature or origin of the affinities. But more recently the aid of electro-chemical agencies has been called into requisition as a means of explaining chemical reactions. One instance of this is afforded by some recent announcements by an American physicist on the rusting of iron. This he finds to be due to electricity; moreover the attack

on the metal is begun—not by the oxygen, as the text-books tell us—but by the hydrogen in the water. According to a modern theory, recently noticed in the CENTURY PATH, many substances when dissolved in water are resolved into ions—minute particles carrying electric charges. These are much more active than the atoms; hence many reactions can take place in the presence of water which cannot take place with perfectly pure and dry materials. The purest water contains, it is said, some ions, and these attack the iron, the action involving an exchange of the electric relations between the hydrogen and the iron. By immersing the iron in a concentrated solution of chromic acid and then washing and wiping it, it is rendered inert, and capable of resisting electro-chemical action. M.

Was Milo a Vegetarian?

SOME writers represent Pythagoras as forbidding all animal food; but all the members cannot have been subjected to this prohibition, since we know that the celebrated athlete Milo was a Pythagorean, and it would not have been possible for him to have dispensed with animal food.—Dr. William Smith's *History of Greece*, 1881

So much for the value of some of the conclusions of learned writers. The above rests on the dogma that a man can not be, and could not ever have been, an athlete without eating meat. And it is a pure dogma; for nowadays it has been exploded into thin air, and many of our modern dietists would be disposed to argue that Milo *must* have been a vegetarian *because* he was so strong.

As ancient history cannot possibly conform to all of our changing views as to what is possible, it will have to be alternately true and false. Let us hope that one day we may know enough to make it permanently true.

The millions of Chinese and Japanese coolies; the millions of European peasants—who are all but vegetarians; and the Arabs who built the Suez Canal, are standing proofs that meat is not an *essential* factor to health. It is said that M. de Lesseps became a vegetarian from conviction, after seeing what his Arabs accomplished with dates and cereals as a food. S.

Thoughts in a Library

(CONCLUDED FROM PAGE 10)

pre-exist in the mind that conceives them. And, according to Occult Science, ideas are also engraved permanently on the thought-substance of the world, where they are accessible to him who knows how to read these invisible books.

The really able, fortunate man is he who is able to meet every emergency as it arises, can always secure what he needs for the moment, and bring out from within as much knowledge as is necessary for the occasion. The other kind of man is the one who has to carry everything about with him ready-made, whether money or books or provisions; he is dependent on supplies and baggage. Our ideal should be self-sufficiency, self-containment. Apparatus has its uses, and books included; but apparatus and books have been much overdone. A good teacher could do more with a single volume, handed around the class, than a poor teacher with a knapsackful of books for each child. To train the mind is the main point; and in this, such subjects as have no direct utilitarian bearing are invaluable. STUDENT

Art Music Literature and the Drama

The Welsh Language—Part III

WELSH is accused of overmuch polysyllabism, of rejoicing in sesquipedalia, of a plethora of unvoiced consonants. The little village of Llanfair, on the Menai, has attained a certain fame by reason of the many epithets that may be tacked on to its name, and which credulous visitors can be induced to thinking a part of the name itself, and even, it is said, to paying pennies to the village children for writing in one word, as "the name in full." "Llanfair pwll gwyn gyll, goger y chwyryn drobwll Llandysilio gogo goch, Llanfair of the white pool among the hazel-trees, by the fierce whirlpool at Llandysilio of the red cave; it certainly has an imposing appearance when written down without gaps or even hyphens between the words of it. But the facts are really all on the side of the defendant. There are less than thirty words of two letters in English, and some seventy of them in Welsh; and many of these are, strangely enough, most metaphysical and philosophic terms, not to be translated in the dictionaries without a sentence. *Om* will be, what surrounds, contains, extends on all sides; *hu*, what pervades all things; *on* has in it the ideas of superiority and continuous existence; and so on. *Huon* is an epithet for deity; *huan*, the all-pervading principle (*an* is a principle or element), is the sun.

In modern tongues we are, for the most part, most polysyllabic and difficult when most metaphysical, and exhaust our little words on the drudges of commonplace speech. But some of these elder languages were evolved and had their heyday when the spiritual worlds were not so foreign to our lips and minds; which fact may perhaps account for the character of so many two-lettered words in Welsh. Then too, there is the above-mentioned awkwardness of the Latin alphabet to be taken into account; and the fact that *w* and *y* are always vowels in Welsh (unless the latter follows a *g*, when it is a consonant). *Nghath* is a word of three letters, although six Roman symbols are taken to write it; *nghylllell* has but five letters, *ng*, *y*, *ll*, *e*, *ll*; not nine.

Welsh syntax and accident are alike surprising, and unakin to the usages of the modern world. You find strange echoes of the Hebrew and old Egyptian; French and Spanish and English and German seem but dialects of the same language in comparison. The verb is pre-eminently the key-stone of the sentence; it is *verbum*, the word, when you have mastered which, one might almost say that all other things shall be added to you. Latin, the language of the organizing intellect, and German, the language of the speculative intellect, agree in their tendency to place the verb at the end of the sentence: Welsh, a language not of intellect at all, but of surging, flaming imagination, normally sets it out first word of all, and dignifies it with the article, or with some particle more or less corresponding with the English "there" in "there is"; and leaves the pronoun out, or

puts it after the verb. You do not say "I find," but "there find (I)"; not "he hears," but "there hears"; not "I am," but "the am." To make a participle you must use a preposition with the verbal noun; you could translate *I see, I saw, I shall see*, by *the am in see, the am after see, the am for see*; or by such phrases as *there shall be a seeing to me*. There is a curious impersonal touch about the language arising out of this shifting the personal pronouns into the background; which we find, too, in such common usages as *it was in his mind, for he thought; the de-*

A COROT LANDSCAPE

sire was on him, for he desired. Then again, the verb *to have* is rarely used, except as an auxiliary denoting not the past but the future; as *caf gweled, I shall have or attain seeing*. In its place you use a preposition with the verb to be: an undesirable possession is *on* you, a desirable one is *with* you. What corresponds to the passive voice is a purely impersonal form: *I am seen, he is seen* would be *gwelir fi, gwelir ef*—*there is a seeing me, there is a seeing him*. We have been accustomed to seeing the present at the head of all the tenses; Welsh sets there the future, and can only come at a present periphrastically, as shown above. The verb *to be* alone has a true present tense; and that contains half a dozen different words for *is*, each with its own peculiar uses.

In any sentence the verb is in the singular, unless the subject is a plural pronoun, or unless for emphasis the noun is placed before the verb; for the rule is, the more emphatic a word is, the earlier you put it in the sentence. A noun, too, will go in the singular, if the presence of a numeral before it obviates the necessity of putting it in the plural. You say *y dynion*, the men; but *deg dyn*, ten men. You conjugate (!) a preposition thus: *ar* means *on* or *upon*; *arnaf, arnat, arno* (fem. *arni*); *arnom, arnoch, arnynt*; *on* me, *on thee, on him*, etc.

Welsh survived four centuries of Roman domination and Roman effort to set Latin in its place. It has now lived through six centuries of English rule. Wales is smaller than Massachusetts, and there is no natural frontier between it and England; indeed it is mainly a long strip of land bordering on the

latter country, into which Englishmen have been passing continuously for the last twelve hundred years, as invaders, magistrates, merchants, judges, churchmen, teachers and tourists. Since the fall of Llewelyn the guide-books and authorities generally have been busily announcing that Welsh is dying out; and yet the undoubted fact is, that it is more spoken, studied, written and printed today than it has ever been during historic times. The truth is, that the people are possessed with the love of it. Cut off by circumstances from the ordinary political aspirations of nationhood, one half their Celtic patriotism has run into a cult of the language. In those parts of Wales where it has become extinct, there has been an obvious lowering of ideals and mentality. For the rest, every aspiration, every ideal that has found its way into the hearts of the people, has come clothed in their own tongue; nothing garbed in English has ever reached them; although probably comparatively few, at any time in these last four centuries, have been without a certain knowledge of English. Matthew Arnold shows that natural magic has been the keynote of Celticism; and running all through the Welsh language is the echo of the magical and secret life of nature, with its impersonality, its ever-changing rich color and music, its frank apathy towards the merely utilitarian; with its bird-notes, its wind and water notes, its notes of the mountains and the sea.

Where no axe the trees is felling,
There the blackbird hath his dwelling.
Bard of all the woodland races,
In the Llan of leaves his place is.
In his proper Welsh he's singing,
With his Welsh the woods are ringing.

On the bosom of the mountain,
There the Cennen hath her fountain;
Dearest of the mountain's daughters,
Ah, what songs go down her waters!
In her mountain Welsh she's singing,
Till the upland wilds are ringing.

Through the empyrean regions,
Goes the Lord of starry legions;
Goes the Sun Bard world-beholden,
World-enriching, glorious, golden.
Yesternoon I heard him singing,
With his Welsh, seven worlds were ringing.

At least, so a Welsh poet has written!

KENNETH MORRIS

The Colossi of Memnon

Two great presiding beings whom you see from an enormous distance, the Colossi of Memnon. Amenhotep III put them where they are, so we are told. But in this early morning it is not possible to think of them as being brought to any place. Seated, the one beside the other, facing the Nile and the home of the rising sun, their immense aspect of patience suggests will, calmly, steadily exercised, suggests choice; that for some reason, as yet unknown, they chose to come to this plain, that they chose solemnly to remain there, waiting, while the harvests grow and are gathered about their feet, while the Nile rises and subsides, while the years and the generations come, like the harvests, and are stored away in the granaries of the past. Their calm broods over this plain, gives to it a personal atmosphere.—"The Spell of Egypt," Robt. Hichens

... So faith is strong
Only when we are strong, shrinks when we shrink.—George Eliot

AN educator has said that "a teacher should be thoroughly imbued with the seriousness and the joy of her calling." That is not only true of those who contact the young but it holds good in all other callings and conditions.

The butterfly type of woman ignores the serious side of life, but it is doubtful if her entire set of pleasures bring to her any of the real joy of living. On the other hand, there are women so tragic in make up or so sobered by experience that they forget the natural joyousness with which life expresses itself everywhere save in the unnatural human realm. Between these two extremes there are many gradations of both types, and many women who are merely empty-minded or preoccupied, but there are few so poised as to be unattached to the pleasure or to the pain of their lives. In a world of "conditioned existence," the pleasure and the pain are inevitable; but to anchor to either is to stay progress in that ocean of being where the soul feels the freedom of its immortality which antedates as it outlasts all conditions.

To lose oneself in a round of pleasures, or to live in the thought of a great sorrow, alike result in narrowing the individual, who should ever aim to develop that sense of largeness and proportion belonging to the real self, the divine student of matter and material conditions.

The woman who is imbued with the seriousness and the joy of living will be a holding-power to all those within the circle of her influence, immediate and remote. There is no measuring the extent to which the positive quality of such a character can and does influence the mass of negative minds. In these vacillating, restless, unhappy days there is great need of the examples of purposeful, active, satisfying lives.

Modern fathers are too often so absorbed in the whirl of money-getting as to be poor answers to that constant question in every

The Seriousness and Joy of Life

growing child's mind as to what life means. The mother can radiate a home influence which may hold the balance of power with both husband and children in the struggle of materialism to stamp out man's faith in ideals. She cannot prevent the many plausible, pessimistic theories from reaching her family; but the wise, active, loving wife and mother is a

SUMMER

THE idle day is rich with budding things
Whereon the bold sun glares.
Dance lightly, lest thou tread on folded wings,
Of flight still unawares.
Ah, delicate thy foot-fall be, while ever
The seed grows in the corn,
The bird in the egg, the deed in the endeavor,
The day in the morn.
Deep in the pool the spawning fishes play;
High in the air the bees buzz out their way.
Everywhere
The children of Summer come crowding in lustrous array—
The myriad children of Summer, beloved of the sun.
Through the long hot noons they are glad of the world they
have won.
Bright and fair
They throng in the meadows and shake out the dew from
their hair;
They sing in the tree-tops, they dip in the slow-flowing stream;
They nod from the hills, in the valleys their swift feet gleam;
They kneel in the moon-light, the bright stars hear their prayer.
Everywhere.

Harriet Monroe in May Fortnightly Review

daily, convincing argument that life is worth while and that making it so brings with it the joy of living.

No one who is alive enough to be really growing can hope to escape times of trial and perhaps keen suffering. It is a serious thought that we must suffer so long as we intentionally

or ignorantly break the law; but there is a compensating joy in the liberating truth which lies in every lesson for those who are wise and impersonal enough to take experience as the tuition which it is meant to be.

A woman who regards this life as but one scene in the soul's great drama of experience will not be psychologized with the passing frivolity, monotony, or tragedy. Imbued with the serious purpose of her life she will feel the noble joy of learning to play well her many parts. The harassed, perhaps desperate business man, facing financial and social ruin, could turn to such a wife and borrow hope and courage for a dark present and an unpromising future. The thought of her, even, might counteract the impulse to suicide in his mind and help him to win a new victory in the conflict with his own weaknesses. Her children would grow up with a faith in their mother's philosophy of life which would have a more vital and lasting influence upon their characters than all the threats and promises of the theological theories and guesses.

The mother needs to consider seriously her responsibility in guiding the souls who are invited to her sheltering care; but if she knows and trusts the Divine Law she can confidently and joyously watch the unfolding child nature and learn therefrom a lesson in the naturalness of the ideal sense which the babe brings with it.

The delight of normal children in the beauty of common things and in the joy of the passing hour, their natural fraternity with the earth and flowers and animals, are the mother's opportunity to teach and to learn a larger realization of the purpose and the brotherhood of all life. The little children about her knee will truly become the mother's wise teachers, and let her see that she does her part to the great end of planting their ideals, hopes and desires, firmly upon the rock of principle and dispassion and self-control. **STUDENT**

Examination for Mothers of the Future

SHORTLY before the act prohibiting the sale of tobacco to children went into force in England, a boy went into a tobacco-nist's shop and was told that he would not be able to buy any more cigarettes after April 1. "That's all right," said he; "I shall send father for them."

Was there not some ancient Greek who, on seeing a boy misbehave himself, struck the boy's teacher? He was wiser than this new law; he knew where to find the real culprit. Clearly the law should have been against the parents, not the children. Any parent whose child is found smoking shall be fined for the first offense and imprisoned for the second!

Is it not pitiable to see the law of the realm stepping in to try to do what the parents have failed to do?—and even finding itself opposed by the parents? How are these parents to be reached? Religion does not seem to have succeeded, nor yet science—in the teaching of common sense.

Theosophy alone can give the parents that sense of the value of life and of their privileges and responsibilities which will make them love their children in the proper way and give them power to control those children.

The advocates of woman suffrage in one American city propose that every woman who applies for a marriage license must take a civil service examination in the spiritual, moral, and physical rearing of a child, because "Mothers are chiefly to blame for children acquiring a perverse development ending in crime and degeneracy." A paper, commenting on this, says:

Character and conduct to a considerable extent depend on the maternal training. If mothers will begin to give to their children the old-fashioned moral training, the old-fashioned sense of moral responsibility soon will be restored in the United States.

This is the Theosophical program; Theosophical ideas are gaining ground. But there are difficulties. One is how to awaken in mothers the requisite sense of responsibility. One is glad to see the suffragists attending to this question, though it does not seem to have any necessary connexion with their usual program. How will the political franchise help them in this? Probably they rely on the passing of that law about the examination and think that women's votes will be needed to pass it. Yet there are more direct and effectual ways than the passing of a law.

Another difficulty is as to the examination and the examiners. If we had any definite science of spiritual, moral, and physical training, and a definite faculty of professors thereof, it would be another matter. As it is, we have neither the one nor the other. As to the physical training of children, we have pretty definite and useful ideas on that; but the other two—the spiritual and moral—are very vexed questions. Spiritual training involves the whole terrible question of religion. Moral training will be found to imply moral fitness on the part of aforesaid mothers. All these efforts are moves in the right direction, but Theosophy is needed to unite and direct them all, and when fathers and mothers realize this they will turn to Theosophy for help. A.

The Aunt of Emerson

WE read and talk much of Emerson but know almost nothing of one of the most helpful and genuine of the factors that worked to build his spiritual life—the influence of his aunt, Mary Moody Emerson. She was one of the most remarkable women of her day, almost wholly self-educated, as was perforce the case with the women of early New England. Emerson tells us that her reading and study embraced Plato, Plotinos, Marcus Aurelius, Milton, Jonathan Edwards, Mme. de Stael, Channing and Byron, a rather heterogeneous collection it would seem to the indiscriminating observer, yet considering the Theosophic light in the Emerson household and the Theosophic thread of purpose shining bright or dim in the works of these writers, not so strange, only natural.

THE CROWN PRINCESS OF SWEDEN

It should not be forgotten that Mary Emerson played the part of hostess in Emerson's house for many years, always, they tell us, scrupulous in her holding to the highest philosophical ideals and showing herself to be quite indomitable when aroused in their defense. Mr. Sanborn, a friend and neighbor of Emerson, gives the following humorous picture of this usually quiet and nearly always calm personage:

I was present at Emerson's house one evening in December 1858, at a conversation of Bronson Alcott's in Mrs. Emerson's parlor, Emerson himself being absent, I think, on one of his lecturing tours, but represented in his own house, as he often was, by Thoreau, when Mary Emerson distinguished herself. Henry James, father of the novelist, two of whose sons were pupils of mine, was present. Not understanding the law of an Alcottian conversation, he began and continued to show his own wit by perplexing the subject with some of his questions and witty paradoxes—much as if, at a parlor wedding, some lively damsel should thrust herself into the place of the blushing bride. Alcott fell into polite silence, and Thoreau, while contesting some of James' assumptions, could not check the flow of the semi-Hibernian rhetoric... charging

society with all the crime committed, and praising the criminal for committing it. Miss Emerson heard this with rising wrath; but when, finally, James spoke repeatedly and scornfully of the moral law, her patience gave way. Rising from her chair at the west side of the room, and turning her oddly garnished head toward the south side, where the offender smiling sat, she clasped her little wrinkled hands, raised them toward the black band over her left temple (a habit she had when deeply moved), and began her answer to these doctrines of Satan, as she thought them. She expressed her amazement that any man should denounce the moral law—the only tie of society, except religion, to which, she saw, the speaker made no claim. She referred him to his Bible and to Dr. Adam Clarke (one of her great authorities from childhood), and she denounced him personally in the most racy terms. She did not cross the room and shake him, as some author, not an eye-witness, has fancied—but she retained her position, sat down quietly when she had finished, and was complimented by the smiling James, who then perhaps for the first time had felt the force of her untaught rhetoric.

One of Mary Emerson's diary records (for November 15, 1805) is as follows:

What a rich day, so fully occupied in pursuing truth, that I did not touch a novel which for years I had wanted. Rose before light; read Butler's *Analogy*, commented on the Bible; read a few of Cicero's letters, washed, carded, cleaned house and baked.

At the head of her grave, in Concord's Sleepy Hollow, is a stone upon which Ralph Waldo Emerson had graven the line, "She gave high counsels," his own personal tribute to her. STUDENT

Jottings and Doings

(From a Student's Note Book)

LADY Violet Greville writes in *Black and White*, an English magazine:

In the sixteenth century we read of a famous female architect, Catherine de Medicis, who in the midst of all her cares of State, found time to initiate and control the plans for the beautiful Renaissance buildings she created for the admiration of her successors. Art and letters occupied the time of most great ladies when politics and religion did not absorb them. One lady, Mme. de Retz, was the mother of ten children and devoted herself to their education. She was a great scholar; but she led forth her troops in the service of the king, against her own son who had joined the Ligue. Princesses were as learned as their neighbors, translated the classics and wrote poetry and disputed about metaphysics. Spinners then found their vocation in presiding over convent schools, and in many families Latin was talked habitually. In one household, of a printer who had married the daughter of a scholar, the very servants understood and spoke the language. Women were philosophical, ardent in politics, great rulers like Louise of Savoie, Anne of Brittany, or Catherine of Medicis; they loved art and culture and poetry; but with all their knowledge, they remained women, governing their households assiduously, bringing up their children, and caring for the poor. Philanthropy was looked upon as the woman's sphere and duty. Organized charity was common then, though now it is looked upon as a modern invention. Marguerite of Angoulême, Queen of Navarre, purposely walked alone through the streets of Pau that the poor might approach her freely. "None," she said, "should go away sad or disappointed from the presence of a prince, for kings are the ministers of the poor and not their masters, and the poor are members of God."

A CONTEMPORARY states that women's clubs are under the ban in Russia. Recently a body of women in St. Petersburg desired to form a literary club, but the Government refused its permission, save on one condition that the club be devoted to philanthropic work.

OUR YOUNG FOLK

Jean Grolier

ABOUT the time when Columbus was engaged in his epochal work for the world, there lived in France a man whose influence gave a positive impetus toward human progress in another field—one whose name is not as familiar to our ears as it deserves to be. This was Jean Grolier, known as the great bibliophile of France.

Although the art of printing was in its infancy, the city of Lyons, where Grolier was born, already had several presses established and these printing offices were a favorite haunt of the growing boy. It is believed that the rare enthusiasm he cherished throughout his life for all that pertained to books and book-making was aroused at that time. His love for them amounted to a passion and although he won high place as a statesman and was a man of large and diversified interests, his devotion to books ran as an undercurrent through all his efforts.

It was this great bookman who started the movement towards artistic printing and binding for which France became famous. He believed a book should be a beautiful and harmonious thing, combining perfect workmanship, elegance, and simplicity, whereas he found the books of that period ponderous and unattractive. Some specimens of his binding and ornamentation are examples for our modern bookmakers to emulate, so remarkable are they for the delicacy of design, and rich, harmonious coloring.

Jean Grolier was one of the scholars of his century, and his home became a rendezvous for the thinkers of his time. His taste ran toward the classical literature of ancient Greece and Rome and his library of three thousand volumes, which was a very large one for those days, contained all the important works of the masters, in exquisitely-wrought folios. These are now scattered over Europe, in libraries and private collections, and are held as priceless treasures. He gave encouragement and pecuniary aid to numberless poor young authors and rescued from oblivion many valuable works which the less discerning did not then appreciate, often paying for the printing of an edition himself.

Aside from the far-reaching influence of his work as champion of beautiful books, which was actually the opening wedge for literature in France and then all Europe, Grolier was a great statesman. He served his country as

SHEPHERDS ON THEIR STILTS, THE LANDES, FRANCE

THE FAIRY FIDDLER

(FFARWEL NED PUW)

A SONG comes breathing on the breeze,
And down around the mountain:

It rose among the alder trees,

And died beside the fountain:—

*"I wander the hills through the long summer daytime
When the dog-roses bloom and the barvest 's a playtime,
And the tall foxgloves wave in their beauty."*

The dragon-fly that darted by,

A flame among the rushes,

He heard the phantom crwth, in truth,

Five bars above the bushes:—

*"And it's sweet in the moonlight, when fairies are roaming,
To dance the long nights where the waters are foaming,
With the deathless young Children of Beauty."*

A fiddler strayed away one day

To where the fays were dancing;

His fiddling makes the heather gay

And keeps the foam a-glancing.

*"By the long sands of Teifi in sunlight a-glimmer,
I pass like a dream through the June noonday shimmer—
Ah, the soul of this wild world is Beauty!"*

Welsh Song

head of the Council of Finance at a most critical period in her history. He was ever honorable, firm, and just, in his official dealings, and if the principles of taxation and regard for human rights he so fearlessly advocated had been lived up to, France would never have been plunged into such a nightmare of dissension as that which came two centuries later. Grolier held an important government position at Milan for several years, during the French occupation of Italy, and endeared himself to the people there. He gathered about him the scholars, artists, and musicians of that country as he did in his own France.

Both France and Italy honored him, and

the writers of his day were almost extravagant in their eulogies. The great Erasmus declared him to be the first scholar of his century, and it is said the Italian poet but voiced the sentiment of his countrymen when he wrote, in a dedication, "You are looked upon as a divinity through all Lombardy." A. P.

Linnéa

THE morning-wind comes rushing through the old wood, over the plains and fields. It dances over the tree-tops and in among the bushes, calling out: "Awaken to greet our Queen! Soon she is here in her

golden chariot." The leaves begin to rustle, the birds to sing, and soon the little flowers open their eyes, touched by the first rays of the sun. Out from the woods the morning breeze carries a sweet fragrance. It comes from the pink little bells that tinkle so softly under the large majestic pine trees. They whisper of the great, wonderful silence of the Northern woods, of the mighty forces slumbering there, and all the trees of the forest murmur: "Silence! Silence!" and stretch out their big branches to protect the little flowers. How dear they are, these tinkling little bells, to every Swedish heart! The "Flower-king of the North," Carl von Linné, loved them more than any other flowers, and after him have they been called *Linnéa Borealis*. BIRGIT

A Mountain Lion

A SURVEYOR, with his assistant, was, one bright moonlight summer's night, high up on a mountain in California. They lay down on the dead leaves preparing to sleep with one eye open, as they had been warned that the region was full of lions. Their weapons, a rifle and a shotgun, they laid beside them.

About midnight the surveyor was aroused by a rustling of leaves. Starting up on his elbow he saw a lion stealthily creeping upon them. The lion came to so sudden a halt when the man sat up that his fore-feet sank in the sand about ten feet away. The first impulse of the surveyor was to seize his rifle, but on second thought he decided to keep still and look the lion in the eyes. For a few minutes the lion gazed at him, motionless, then ran away as fast as he could go.

What, think you, did the lion see in the man's eyes to make him turn away? J. H.

THE CHILDREN'S HOUR

THE BIRDS' HOUR

THE world at noon belongs to the sun,
At eve to the home-coming herds;
But while the dew is pearly—very, very early,
The world belongs to the birds.

Ethelwyn Wetherald

A Dog Returns Good for Evil

THIS story is taken from a newspaper, which gives a full account of how one cruel little boy learned a much-needed lesson from a collie dog.

Broncho is a big brown collie with a white face, and belongs to a family living near Boston. He was the playmate and pet of all the children in the neighborhood—except one. This one was six-year-old George whose father was Broncho's master. George was a boy who enjoyed teasing animals. He seemed to have no love for any of them; he served cats and dogs alike, and it was not an uncommon sight to see his face and hands covered with scratches made by the cats' claws when they had to defend themselves against him. Broncho, however, never hurt the little boy though he was often pinched and beaten mercilessly by him. All he would do was to get away as quickly as he could whenever George appeared, showing his dread by his drooping tail and pleading eyes.

You must not think that no one tried to protect these poor pets, or to teach this cruel, naughty boy better ways. His father and mother did the best they could to show him the right way to treat animals, but, as he did not try to follow it, they decided that they would give away the animals rather than have them treated so cruelly. It was hard for them to do it for they loved them, especially Broncho, very much. They kept putting it off, and before they had finally decided to act, something happened which did for their little son what they had not been able to do themselves. It was Broncho himself who taught the boy the lesson he needed so sorely.

One summer afternoon George and his nurse joined a large group of nurses and children in the park. The children played on the grass and the nurses sat in a summer-house not far off. Broncho, as usual, was as merry as any of the children and joined in the games. George, seeing this, struck the dog and sent him away moaning, and every time the other children tried to comfort or play with the dog, George would strike him again, as if he could not bear to see any one show affection for poor Broncho. One little girl defended the dog bravely, making George so angry that he ran away. No one noticed where he went, not even the nurse.

He found his way to the edge of the lake, and began to play about a boat there. Some bigger boys were going out in the boat but George managed to climb in first, and the boat slipped away from the shore, taking him out with it.

The big boys thought it was fun at first, and laughed, but not for long. George got

Lomaland Photo. and Engraving Dept.

POLLY'S TURN TO HAVE A LESSON

frightened at being alone in the boat as it got farther from the shore and, making a sudden move, lost his hold. Over he went into the water. Then the big boys saw the danger. They shouted for help and soon all the nurses and children had run to the shore and were watching the child struggling in the water. They were all so frightened they could not do anything, even the big boys. George went down, once, twice.

Then a splashing sound was heard, and Broncho was seen swimming swiftly out to where the little boy was. As he rose the dog caught hold of him. Then he swam back to the shore even faster than before as if he realized that his haste might save the life of the child.

It did. There was prompt attention given to the almost drowned little boy and he was no worse for his wetting. Indeed, in a very wonderful way he was better for it. The dog whom he had given so many kicks and blows, and who had so often shrunk away from his cruelty was the one to come to the rescue. The noble act softened the little boy's heart. Ever since that day George and Broncho have been close friends; they play together in daytime and at night Broncho sleeps near George's bed. The dog, the faithful, brave, collie dog, taught the little boy a lesson which, it is to be hoped, will last him a lifetime and help him to learn mercy to animals.

GENTIAN

LET me be great enough to see truth on every side.—Victor Hugo

A TRUE home is as a Light upon the pathway of the world's life.—Katherine Tingley

The Divine in Everything

"MOTHER," said Alice, thoughtfully, as she sat before an open grate, gazing into the fire, "I have heard that Indians believe they can see the great Spirit in the flames. I have often thought about it, but never understood it before; but now I know it is true."

"And how do you know?" asked her mother, smiling.

"Well, it is just this, Mother," Alice answered. "Before I believed in Theosophy, although I was always taught that 'God is everywhere,' still I always thought of God as some wonderful creature living away off somewhere in Heaven; and when you read to me from the *Bhagavad Gîtâ*, 'I am the taste in water, the sweet smell in the earth, and the brightness in the fire,' it made me realize that God was not a personal man, but a wonderful spirit and force that *really is everywhere*, and it made me so happy."

"Yes, dear girl," answered her mother, "the divine force is in and about everything in the universe. When man overcomes his selfishness, it will shine through him, radiating all around, even as it does in the fire."

"Oh, yes!" exclaimed Alice. "Now I see! That is why great and good people are said to be shining lights, isn't it, Mother?"

A.

OBEDIENCE alone gives the right to command.

HE serves all who dares to be true.—Emerson

THE dutifulness of children is the foundation of all virtues.—Cicero

THE MYSTERIES OF THE HEART DOCTRINE

PREPARED BY
KATHERINE TINGLEY
AND HER PUPILS

The Theosophical Book *of the* Twentieth Century

Tells the story and the history of the Theosophical Movement.

The prices are \$2 in cloth and \$1 in paper, which barely cover the cost, for it is printed and bound, not gaudily, but with such carefulness and thoroughness of art and craft as to make it unique among modern edition books.

ISIS CONSERVATORY OF MUSIC, Point Loma, California

SOME OF THE ERRORS OF CHRISTIAN SCIENCE CRITICISM

BY H. P. BLAVATSKY AND WILLIAM Q. JUDGE

CONTENTS

"The Empty Vessel Makes the Greatest Sound"
A Note of Warning

—by H. P. Blavatsky

Of "Metaphysical Healing"

Affirmations and Denials

The Cure of Diseases

Replanting Diseases for Future Use

—by William Q. Judge

A MOST VALUABLE PAMPHLET. Outside of Theosophy there is given no adequate explanation of the healing that is at times accomplished, nor of its *rationale*, nor of the ultimate price that must be paid and the dangers connected with such practices.

This pamphlet is invaluable to all students.

PRICE - 15 CENTS

Burbank's Observations on Mutation of Species

THE attitude of Theosophists towards present-day theories is eminently reasonable, and has been stated by H. P. Blavatsky in her *Secret Doctrine*. So long as science holds true to its inductive method, observes the facts correctly, and reasons logically from its observations, it can arrive at nothing but the truth, and its conclusions must command respect. But when its representatives depart from this method and dogmatize on the basis of wrong observations or wrong inferences, then their conclusions, being necessarily false, cannot be accepted. And it is necessary, in defense of science itself, and in vindication of its worthy exponents, to make this distinction. For we often find the dogmatists pleading the scientific method, which they have failed to follow, as justification for their erroneous conclusions, and thereby demanding a respect to which they are not entitled.

Frequently we find savants reasoning deductively—reasoning from general principles instead of from facts. A few observations seem to them, perhaps, to lend color to some theory; and then, instead of extending the range of their observations they prematurely adopt the theory, which thus becomes a dogma, biasing their future observations and often clung to tenaciously in spite of facts to the contrary. Of course this method leads not to one truth but to many opinions; for different theorists fancy different theories.

This tendency to hasty generalization is often observed in the theories of biologists. One has a theory that animals and plants cannot transmit to their offspring acquired characteristics; another has a theory that they can; and so on. The actual truth of the matter is surely ascertainable by the infallible method of actual observation and experiment; yet we are confronted with these conflicting opinions.

As an example of what appears to be a true following of the scientific method, one may refer to some remarks upon Luther Burbank, which we find in the columns of a contemporary. They occur in a review (in the *Boston Transcript*) of a book on Burbank's work, by Dr. Kellogg and Dr. David Starr Jordan.

The Work of a Genuine Scientist

Mr. Burbank, we are told, has not formulated any new laws of species-change, although he has the right to do so. He is entirely clear in his mind as to the inheritance of acquired characters. "Acquired characters are inherited, or I know nothing of plant life." And he is convinced that the only unit

in organic nature is the individual, not the species. He is convinced that the so-called species are wholly mutable, and that their apparent fixity is due solely to the length of time during which their racial type has been transmitted by the individuals. He does not agree with De Vries that mutations in plants occur only at certain periodic times; but he thinks that they do so whenever the special nutrition or other influences are brought to bear on them. He does not think a sharp line can be drawn between small fluctuating variations and large occasional variations (or "sports"). In short, he has arrived at a number of separate conclusions as a result of his observations, but has formulated no new fundamental principles.

Observation—not Speculative Deduction

"And yet," say the writers, "none of us has done what Burbank has been able to do. . . . What is it that Burbank brings to his work . . . that others do not?"

That "and yet," which we have italicized, seems to indicate that the writers considered Burbank's failure to formulate fundamental principles as an obstacle to him, in spite of which, he has done what he has. Others might be disposed to substitute "therefore" for "and yet," and to say that Burbank succeeded because he did not rush to hasty generalization and so prejudice his observations.

It will be noticed that Burbank has, according to this account of him, been direct, practical, and truly scientific throughout. He has confined himself strictly to the facts, and resisted all temptation to draw sharp lines of demarcation, to adopt fixed theories, to regard particular cases as establishing general

Barriers formed of Ignorance Molded by Fancy

rules, or in any other way to limit and prescribe Nature in accordance with the limitations of fancy. Another most important point is that

this keen observer, this practical scientist, by means of his actual observations and experiments, has completely routed a certain favorite dogma—the dogma that species are fixed. He says they are "wholly mutable." Now what does this mean? Does it not mean that scientists have, in this case as in other cases, proceeded by the method of first formulating a wrong theory about Nature and then devising all sorts of difficult explanations to make the actual facts conform to their wrong theory? Did they not first assert that species were fixed and then set about to explain how species changed? This is a repetition of the plan of calling organic matter dead and then trying to explain, by means of a life-principle or something of the sort, why it exhibits life.

The fact is that it never was dead at all; and here Mr. Burbank assures us that there is no reason to scratch our heads over the question

**Nature is the
Universal
Fluid**

why fixed species vary, because, as a matter of fact, they are not fixed at all, and never have been, and we were mistaken to think they

were, as they are changing all the time. In brief, what after all is a species? It is like any other natural class or category—a thing without definite borders, always changing and fluctuating. It usually changes very slowly, so that it appears fixed for enormous periods of time—as far, perhaps, as our knowledge reaches. But vary the conditions, and Nature will quickly respond. Yet species tend to revert to a certain type which is their standard for the age or cycle. Even here Burbank is not dogmatic; he says that starvation will cause reversion; but, instead of exalting that into a theory, he adds that “so will overabundant nutrition.”

Then there is his insistence upon the idea that *the individual, and not the species*, is the unit in organic nature. Here, again, he is practical and of common-sense. Where the dogmatists see a lot of inert irresponsible matter, acted on (presumably)

**Will,
Life
and Action**

by some mysterious external “law” or force, Burbank sees—what he sees in the world of men, that is, individuals; individuals living their lives, following the laws of their nature, adapting themselves to their conditions. The “species” are largely the classes into which we have chosen to group these individuals; but Nature cannot be expected to abide by our classification. The “laws of Nature” are a code which we have drawn up, representing our own conjectures as to Nature’s laws, conjectures arrived at by watching her at work; but what can Nature know of our code? When she perpetrates a so-called exception, it means that we have made a mistake and must alter our code.

STUDENT

The “Fourth Dimension”

A PRIZE essay on the “fourth dimension,” in a late number of the *Scientific American*, says:

It is impossible to form a mental picture of the fourth dimension. . . . To gain a partial and symbolic idea of its meaning, resort must be had to analogy with dimensions of a lower order.

But where can we find dimensions of a lower order? Is it any easier to form a mental picture of a two-dimensional form? We cannot do it; the so-called two-dimensional forms which we imagine are in reality three-dimensional. A perfect two-dimensional plane would have only edges; it would have no surfaces; surfaces are the boundaries of solids; lines are the boundaries of surfaces. A two-dimensional figure has no surfaces; it is a surface; it has absolutely no thickness. Can we form a mental picture of such a form? No; we but deceive ourselves by imagining a *very thin* three-dimensional figure. The three dimensions of solid bodies are so inseparably interblended that they cannot exist apart from each other. Take away thickness, and length and breadth instantly vanish; the entire concept of physical extension vanishes. Therefore our essayist asks us to gain

an idea of an inconceivable thing by analogical reasoning from another inconceivable thing.

Next we come upon this:

Considering space as an aggregate of points . . .

But a point must, for the purpose in question, be defined as having *no* dimensions. Hence no quantity of points, however great, can have any dimensions. You cannot make up 1 by adding together a lot of noughts, neither can you make up a line by adding together a number of points. Old Euclid did not make his line so; but some modern geometers have thrown him overboard.

Added to the above is the confusion between space and that which occupies it. Space has no dimensions at all; we cannot form a mental picture of empty space. When we try, we delude ourselves again and imagine a large room with walls; we may imagine those walls as being very far off, but we conceive ourselves as traveling about, up and down, to and fro, in this empty space; whereas we could not travel in that which has no dimensions. The idea which we have thus confused with the idea of empty space is that of the *extension* of material substances; we have conceived space as a vast tenuous gas.

Thus there cannot be one-, two-, three-, or four-dimensional space; space being utterly devoid of and *unconnected with* dimensions. All we know is that material bodies have three dimensions, or have a threefold extension; and these three can no more be separated than a stick can be separated into two parts, each having only one end. That property of material substances (or of our perceptions) which is called “extension” is essentially threefold. Any two-fold or four-fold aggregate would not be extension at all; it would be something else. We may speak of forces as being two-dimensional—this is very noticeable in magnetism and electricity. There are probably orders of existence which might be described as four dimensional—so long as we carefully avoid connecting the idea of geometrical extension therewith. They would have four *somethings*—not four spatial directions.

STUDENT

The Colleges and the Church

IN the August *Cosmopolitan* is an article entitled “Christianity in the Crucible,” which is a strenuous attack on ecclesiastical dogmatism, and a defense of the colleges in their attitude of freedom of thought.

Unfortunately, however, the article expresses some views on the question of marriage, which will probably give the churches a handle of which they will not be slow to avail themselves in their reply.

It is a great pity that earnest protests against ecclesiasticism should so prejudice their case. It is this that gives ecclesiasticism its hold.

The article begins with a quotation containing the following words:

Modern science [belongs] to the transition . . . from Christendom to—who can say to what?

—and says that many of the college professors say that the dogmas and interpretations of the church not only should be disbelieved and repudiated, but denounced as harmful to mankind. The last slavery from

which mankind must be freed is slavery to sacred myth. The doctrines and traditions that deal with fear have tortured the spirit of man and hindered his development. The churches have set up a celestial czar, a conception which has given man a sense of weakness, inferiority, and fear, which has been the deadening element in his history. The church has always been an obstacle to progress. It has always been the last to come into possession of the truth, and has had to recede from its position in every field of science. It is still engaged in the effort to strangle thought. Bible texts have been arrayed against astronomy, geology, and almost every discovery and invention. The theological God is not big enough for this century. But the age does not need less God, but more God. The teaching that the soul of man is dependent on a spiritual tyrant is at variance with twentieth century thought.

And much more to similar effect. With regard to marriage, undoubtedly ecclesiasticism has abused its power in this respect as in others; but the views expressed in this article will possibly alienate a good deal of sympathy. It is stated that marriage is not sacred; that it is a civil contract. But if man is more than an animal, if he has the Divine Influx, if he is a potential God, then marriage becomes a sacred (not church) institution, and its physical relations assume a wholly subordinate part. It becomes a mutual undertaking to co-operate in living the pure and unselfish life; a vow to lay down selfish interest on the altar of sacrifice and to realize the blessedness of union. If people do not see their way to taking their pledges before an ecclesiastical God and in a church with priests, they should take their pledge *to the God within them*, and thus strive to make their marriage something more than an expression of mutual affection.

One cannot but sympathize in the main with this protest of the colleges against ecclesiastical domination; yet they have committed the usual mistake of going too far and thus inviting a reaction. They speak of throwing over “slavery to sacred myth.” Say rather, slavery to dead-letter interpretations of sacred myth, slavery to a dogmatic interpretation of a *single one* of the world’s collections of sacred myths. The Wisdom of the ages has been enshrined in sacred allegories and symbols; and if, instead of quarreling about the authenticity and meaning of a single collection of these, we were to study the question of sacred symbolism and religion generally, we might avoid mistakes and make a better case against medieval theology.

Religion needs rescuing from the hands of dogmatism. But this does not mean throwing over everything except a few moral and ethical principles and attempting to found an order of society on the basis of modern science and sundry vague aspirations about fraternity and civic duty. We need the *Gnosis*, the *Sacred Knowledge*, which ecclesiasticism took away from humanity, and for which it has substituted its dogmas.

We must have a knowledge of the Divinity of man, of Reincarnation, of Karma, and many other essential truths, ere we can have a secure basis for a new order of ages. Otherwise we shall but throw off one kind of dogmatism to fall into another. STUDENT

Some Views on XXth Century Problems

God as an "Each"

PROFESSOR JAMES' *A Pluralistic Universe*, charming as usual in style, will doubtless be taken by many as affording them the religious ground they want, safe from the earthquakes that are rocking everywhere else.

Pluralism makes of the universe a many, each related on all sides to the rest, but each an each to itself. It is to replace absolutism, which resolves all into one. God is one of the each's, however lofty; not the all; and therefore finite, "either in power or knowledge, or in both at once." Professor James is a pragmatist, and therefore does away with the absolute ground of being as a consideration not yielding practical results in feeling and conduct.

But it will not away. If God is only an each, as I am, I might reverence him for his lofty place in the whole. But am I not compelled to look beyond him for that which is beyond both him and me, the container and source of us both? God, in this pluralistic view, is but the highest of the personalities in the universe. Theology has done as well as that, and the Red Indian has done better. Says Natalie Curtis, in *The Indians' Book*:

The Supreme Being of the Dakotas is called Wakan-Tanka. In English this name is commonly rendered "The Great Spirit," but it would be translated more correctly as "The Great Holy Mystery." Wakan-Tanka is an omniscient force. This conception of an impersonal, spiritual and life-giving power is held by many Indian tribes as well as by the Dakotas, [and is] an intense and integral part of the Indian's nature.

They recognize lesser spiritual beings, such perhaps as Professor James' God; "but these, like all else, owe their existence and their power to the Supreme One." And the "Medicine Men," whose name is very badly translated, Men of the Holy Mystery, rather, owe their power and wisdom to having entered into a spiritual relation with this source of all powers.

If thinkers insist that the whole universe shall neatly render itself in terms of mind, then the endless confusion must continue and they will attain nothing and achieve nothing in their own consciousness. That which is to thought—nothing; but to the consciousness raised to its highest power, the one reality—it is through that *presence* that man comes by his own. "The knowledge of it is a divine silence and the rest of all the senses." STUDENT

A Delayed Incarnation

THE Fourth of July orations and sermons leave as usual a great deal to be desired. Not one that we have seen evinces much comprehension of what a nation is; few evince much awareness that there are other nations than our own, still less that those others also import something in the scheme of things.

We talk a great deal of evolution, yet never carry the conception beyond the individual man. He is to develop this or that faculty or lose this or that unnecessary power. But the individual physical man is a set of organs, closely co-operating for a general end; and each organ is a set of cells, closely co-operating

for a general end. In its way each organ thinks and each cell thinks. And in his way each man thinks; and even the nations, the organs of the body of humanity, are feebly beginning as wholes to think and feel.

The cells of a body are visibly stuck together, or visibly connected by some medium, and the organs are visibly united with nerves. Because the medium that unites the human individuals and the nerves that unite nations are so far invisible, the phrase "the body of humanity" appears to us but a metaphor and somewhat sentimental at that.

Nevertheless there are moments when we know better. If we would use our imaginations we might know better still. Who does not appreciate the "general atmosphere" of good feeling on a Christmas morning? But its generalness is possible precisely because of the invisible medium uniting us.

Go back to the original Fourth and recover in imagination the general pulse that suddenly thrilled the country into one high purpose, the purpose to be a new nation with a new national ideal. The thrill was possible because of the invisible uniting medium. We can only find the glorious possibilities of that medium when in our hearts we have an altar unselfishly erected to our country instead of to our individual selves and our interests. Then a new thrill would unite us to a new and richer harmony every morning. We could learn *what* organ we are of the body of humanity.

For the other nations are also organs, each an essential to the perfect health and perfect functioning of each of the rest, our own included. But so far, the nerves thrill too much with hostility to thrill with mutual help; disunite, instead of connecting the national hearts.

Not until, through the ages, the human body had been perfected, organically harmonized and related in all its parts and in every action, was it possible for a thinking soul to incarnate therein. Each of us can think out the analogy—rather, the *same process* in magnification—for himself in his own way. We are holding back an event to which many an ancient scripture obscurely refers. Individual egotism and national egotism must vanish in Brotherhood. STUDENT

"Environment" for Souls

WHY should we not give the word environment, in its application to man, a fuller and deeper meaning? If a man in a mixed dinner company ventures on a remark about the soul or death, he will not only get no response but will feel a chill in the atmosphere. His seed will have fallen on quite unresponsive ground and he will sow no more of that sort. His mental "mutation" will have died from the operation of a sort of natural selection. Had he been sensitive in advance to the mental environment he would not have permitted his mind to "mutate" in that direction. Had the environment been other, he might presently have produced a thought of the utmost value both to himself and the rest.

A child is born with a mind sensitive in advance to the mental atmosphere of the time.

The atmosphere presses in at every moment, day and night. Mutations which will not flourish therein are checked in the veriest germ.

The word atmosphere may be regarded as something of a metaphor, or as an actual fact. The tendency of the time is to think that there is a real atmosphere of mind, corresponding somewhat to thought as the air does to respiration. A thousand phenomena as imperatively require that hypothesis—for those to whom it is no more—as those of light and electricity require an ether.

But either way, that there is now no great literature, great drama, poetry, and the rest, may not be due to the non-arrival of the great writers. No attitude of the time spirit can positively call these forth so far as we know. The mutations of creative souls in these directions may be constant, as well at one time as at another. But the time spirit can make them feel from the very first moment of their stir that they are not wanted. It can chill them out as the dinner company chilled out the venturesome speculator's thought about soul and life and death.

The chill may strike deeper yet, even hindering altogether the birth of genius. We get, in fact, the amount of genius we are prepared to welcome. If none is in sight, it means that we are filling the environment with soft dreams of dollars and *Dreadnoughts*. STUDENT

The Senses

HOW many senses have we? The answer is not so obvious as it seems at first.

In addition to the five, various sixths are proposed; for instance the "homing" sense of ants, bees, birds, and other animals, but of which we really know nothing; the awareness of near objects, exhibited by the blind, which is probably a delicate touch and temperature sense; and the "muscular sense" which tells us how much our muscles are on strain; and is a feeling, not a sense at all.

Behind all these is the mental sense. After the purely sense consciousness has perceived something, that bare perception, which standing alone means nothing, has to be taken by the mind and instantaneously thought into place and meaning. It can only get real meaning from being mentally related to all the rest of our experience.

But again; behind this is a still deeper sense, if that word may still be used. The Ego, I, perceives all that passes in the mind, perceives the mind wandering from thought to thought, from wish to wish. It may permit this to go on; or it may stop it and place the mind upon whatever topic or into whatever state it chooses.

So we really come to seven, the ordinary five and two more. For the sixth we have the mind, receiving and arranging not only what it gets from the five but from the body's inner consciousness, running up from bare awareness of general being to definite awareness of each muscle and organ. And for the seventh, the soul's perception of what the mind is doing in respect of thought and feeling. Cultivating this, we begin the path of self-knowledge. C.

Archaeology

Palaeontology

Ethnology

Ancient Etruria: her Successive Civilizations

ETRUSCAN "DRAGON OF WISDOM"
(From an urn in the Museum of Volterra)

"Slowly the Bible of the race is writ,
Each Age, each Kindred, adds a verse to it."

UNTIL the modern science of Archaeology shall have grasped in some degree at least, the meaning of these two lines, shall pursue its course in closer union with an equally emancipated and sympathetic science of Linguistics, and (what is very far from least) shall give a due respect to national and universal tradition: until, in fine, it shall recognize something of the *meaning of life*—or perhaps only that life has a meaning, such problems as that of the Etruscans will remain by it unsolved. It is the meaning of life after all, that renders the science real, and living, and which gives the spur to all the output of energy and enthusiasm in research and the gathering of that growing great mass of details which will find their real appreciation when they become parts of a single great whole. For it is "The Meaning of Life" that is writ large across all these manifold bits—so large that he who only sees the bits misses the inscription.

A recent article in this Review noticed the report of some published discoveries by a professor in a leading university, who, working through certain Runic analogies in the hitherto untranslated Etruscan inscriptions, has arrived at the assurance of their Trojan descent, and thus "confirmed the story of the Aeneid" on the origin of the Romans. It is with no desire to derogate from the value of this re-discovery (which really confirms a good deal more than the Aeneid), that one is still obliged to say that the Etruscan problem is not yet solved, nor its depths even plumbed, by either our archaeology or linguistics.

It is possible within a short article to sketch but the barest hint of the breadth and the antiquity of the Etruscan civilizations. Skilled in road-making, aqueduct-building, architecture, in civil polity, and in all the thousand arts of civilization, only the dim record of their achievements has come down to us through the pages of Roman historians, and in their buried tombs and cities. Their literature has disappeared, though we are told by Varro, Livy and others, that it included histories, poems, tragedies, books of discipline and religion. Of their very language we have but isolated tomb inscriptions, mostly only proper names, and vase inscriptions, chiefly also names of deities or heroes. The alphabet is known,

1. H X 4.8. Y. 1. T. M. 2. 9. 9. 1. H. 1. W. 1. J. 1. 1. 0. 0. 3. 1. 2. A
A B K D E G I B O I K L M N O
A B C D E F G H I K L M N O P Q R S T U V W X Y Z
W N P A R Y * N I J H T B C Y A

so that transliteration is easy; but it is translation and the placing of the language itself in its proper place in the human family that has been the unsolved crux. Isolated affinities, some very striking or even weighty, have been found with many other tongues (Lanzi mentions among such the "Ethiopic, Egyptian, Arabic, Coptic, Chinese, Celtic, Basque, Anglo-Saxon, Teutonic, Runic, and what not," let alone Latin, Greek and Hebrew). Very ancient traces were found among the Rhaetian Alps, by Steub, in 1842. And a case which, while weak in many of its

single identifications, yet possesses very considerable cumulative weight, was in 1874 made out by Isaac Taylor for a Finno-Turkic affinity or origin.

A comparison of the forms of the letters affords much interest. In the first of the accompanying lines we see the actual Etruscan alphabet as given in full on a cup found in a tomb at Bomarzo, with alternate forms of some letters (z.th.k.m.n.p.s.t.x) added for comparison. It reads from right to left: a.e.z.th.i.k.l.m.n.p.r.s.t.u.ph.x.h.f (th, ph, x, h, f, standing in this transliteration for the Greek θ, φ, χ, aspirate and f). The second and third lines, from left to right, show two Pelasgic alphabets also found in Etruscan tombs; this is the archaic Greek found all around the Mediterranean basin. The fourth line, left to right, is an alphabet of Runes, and reads f.u.th.o.r.k.h.n.i.a.s.t.b.l.m.y.

The surroundings of the third of these alphabets are interesting in the highest degree. Near the hamlet of Cervetri, the ancient Agylla, or the Caere of the Etruscans, and not far from a little brook by whose banks Aeneas is said to have received from his divine mother his god-made arms and the prophetic shield of future Rome,

*clypei non enarrabile textum,
Illic res Italas, Romanorumque triumphos,
Fecerat Ignipotens,*

many marvelous tombs have been uncovered. Among these is the tomb of the Tarquins, where some fifty of that royal race were buried; and to others we will refer later. This city is held to have been one of the most ancient sites in Italy; Dionysius, together with Servius, Strabo, Pliny, and others make it far pre-Etruscan, built "by the Pelasgi, or by the aborigines." Solinus also says the same, and adds that the Pelasgi "introduced letters into Latium." The bearing of these traditions will become apparent in connexion with the accompanying sketches. In one of the tombs of Caere was found a little vase, bearing the above alphabet (our third line), around its base, and around its body a syllabary: ki, ka, ku, ke; ti, ta, tu, te; etc., the forms of the letters in the syllabary differing in several important respects from those in the alphabet. In this connexion should be mentioned another alphabet (our second line) found on the wall of a tomb near Volterra, among a number of mortuary inscriptions. This alphabet, the letters of which after the omikron are erased, is also accompanied by the fragment of a syllabary: ma, me, mi, mu.

At Caere, in 1836, was opened a thitherto virgin tomb, the bare recital of whose wonders would far exceed our space. In the outer room was a bier of bronze, a car of bronze, shields, darts, bell-vessels, tripods, of bronze and iron; in the inner chamber ornaments and vessels of gold, silver and bronze, all of exquisite workmanship, including an Egyptian-like breastplate. Everything was of most archaic design, and the entrance to the tomb, which lay beneath a large tumulus of covering earth, is shown in the above sketch. The marked resemblance to the Treasury of Mycenae, and the Cyclopean gallery at Tiryns, and other tombs of Asia Minor, is too striking to need comment. It is noteworthy that while bearing strong Egyptian similarities, the objects in the tomb were yet unmistakably Etruscan. And nevertheless they contained a symbolism of such a character as to serve as the basis for a work written, from the contents of this tomb, to prove the *Mithraic* character of Etruscan worship. The total depth of this tomb, known as the Regulini-Galassi, is 60 feet.

Two other styles of monumental remains, equally marked, and yet equally distinct both from each other and from those we are discussing, have to be touched upon.

Twenty miles in from the sea, occupying, with its circuit of walls intact, the summit of a truncated cone, in the midst of an amphitheater of lofty mountains, lies the hamlet of Saturnia—name of ancient omen. All around Saturnia lie monuments of a character unique to this location within Etruscan bounds, and yet too familiar in their likeness

to the dolmens, not alone of Cornwall and Tartary, but of the entire world, to escape recognition. Some of the cap-stones measure 16 feet; broken pottery abounds, and on the testimony of the peasantry, bones in these tombs were those of giants; some of the tombs are still found surrounded with the well-known circles of raised stones, that characteristic so at variance with the ultra-savage explanation usually given of their erection. And now at Saturnia is also found the absolute refutation of one of the stock arguments of that archaeology which defines these earliest periods as but little removed from animalism. The walls, two miles in extent, while in their present form only about 500 years old, yet include portions of former walls, Roman and other, clear back to the most ancient Cyclopean. Of the latter only portions remain, but the construction is the same as of the walls of the neighboring town of Cosa, 20 miles away, which are shown in the sketch below. Let first the marked

similarity to the most ancient Peruvian, and other, walls be noted; and then that these great stones, so dressed and fitted that a pen-knife will not pass between, smoothed on the surface so that it looks like one smooth great rock lined by surface scratches; and then (recalling the usual explanation that such walls as these were built of the naturally irregular masses of limestone, or other irregularly splitting rocks, by people not yet advanced to more perfect masonry)—the Cyclopean walls of Saturnia are of travertine, which splits longitudinally! The builders of these time-defying walls hewed the rocks to those polygonal shapes because they wanted them so, in spite of, not because of, the nature of the rock. And succeeding generations, on man's rise from savagery (?), having lost the art of their predecessors, added other layers, of plain square flat blocks of the same stone, but simply laid, not fitted, as is seen in the walls of Cosa, in our sketch.

And here now a problem. Etruria is covered with rock-hewn tombs innumerable, of a type to be considered in a succeeding article, and dating from a time which, in spite of Roman tradition and history, has become for us practically pre-historic. And throughout the same region are many "most ancient places," on the authority of that same tradition, where also we find such masonry as this, showing irrefutably the highest skill. And in this connexion we hear of "Pelasgi," a lettered race who must, to judge from their fame and the monuments fathered, by ancients and moderns, on them, have covered a great part of the earth. And manifestly back of all that, and especially at the traditionally most ancient sites, we find traces of those circle-builders whom our modern astronomers are only now beginning to understand—in small part.

How many waves of civilization have overspread the earth, and what lapses of time between so different cultures must be predicated? W. E. G.

✻ The Trend of Twentieth Century Science ✻

The Scientific "We"

IN a London contemporary Sir Ray Lankester discourses interestingly of protoplasm, life, and death. His description of the activities of some of the cells calls to mind the article by H. P. Blavatsky on "Kosmic Mind," but there is a good deal in that article that this particular scientist has not yet arrived at. For example, what of a life principle animating the organism and withdrawing when "the change that men call death" occurs? Sir Ray Lankester believes that "the activities, to which we give the name of life reside in protoplasm, and are chemical and physical activities." And death is "the chemical undoing or decomposition of protoplasm." May not that decomposition, however, be brought about by the withdrawal of a life principle? He sees no more necessity for "an essence or thing called life," than he sees a need for an "essence or thing called death" when that undoing takes place. There are still, he says, some who with happy and obstinate adherence to primitive conceptions think they can explain things by calling up vital essences and wandering spirits, but

we have given up the notion that life is an entity which enters into living things from without and escapes from them at death.

That "we," — is it not a little too ambitious? There are still scientists, eminent as Sir Ray Lankester, who cling to those "primitive conceptions" as he calls them. In the article on "Kosmic Mind" previously alluded to, the professor of physiology at the University of Basle is quoted as speaking in words which were surely meant to reach men of Sir Ray Lankester's turn of mind:

It would be folly in us to expect to be ever able to discover, *with the assistance only of our external senses*, in animate nature that something which we are unable to find in the inanimate.

And yet Sir Ray is evidently limiting himself to those external senses in his investigations. The Basle lecturer points out that man, being endowed "in addition to his physical senses with an inner sense," a perception which gives him the possibility of observing the states and phenomena of his own consciousness, he "has to use that inner sense in dealing with animate nature."

There is then a way of getting certain, definite information on the question of the existence or non-existence in organisms of a "life principle." Religion as popularly understood cannot afford any light, and a science limited by the five external senses, or even with the addition of the mind, can only deny or assume a necessity for it. H. P. Blavatsky hits off the situation exactly when she says that official science is surrounded on every side and hedged in by unapproachable, for ever impenetrable mysteries.

And why? Simply because physical science is self-doomed to a squirrel-like progress around a wheel of matter limited by our five senses.

And "if no way were of breaking from that" wheel, we should be surely in a sorry plight. How much was needed the revival of the teachings now known as Theosophy is

very evident. But things seem to be moving. When, years ago, Edison — as reported by Mr. G. Parsons Lathrop in *Harper's Magazine* — said that his personal belief was that the atoms were "possessed by a certain amount of intelligence," he was severely criticised for indulging his scientific imagination. Now, in the article by Sir Ray Lankester, we are told of the remarkable doings of the cells:

Some or other of them in fact do in their small microscopic way all that the complex, big animal or plant of which they are constituents are seen to do.

Are we to believe that these phenomena are merely chemical and physical activities?

Until the claim of Theosophy to throw light on nature visible and invisible, is accepted, its teachings might be found useful as working hypotheses. It seems to step in where science and religion fail. F. D. UDALL, M. J. I.

Medicine Past and Future

HOMOEOPATHS are beginning to point out that modern medicine is strictly following their lead. The homoeopathic principle is that a drug which in a full dose will produce a disease or set of symptoms, will in a smaller dose rouse the system to the cure of the same.

Volunteer experimentalists dose themselves with the medicine under consideration, until a set of symptoms results. This same set, when occurring as a disease, is treated with smaller doses of the same medicine. According to the theory, the small dose is enough to rouse the system to the production of an antagonistic state. If the theory absolutely holds, it is only necessary for the experimentalists to go on investigating more and more medicines until they have found the reply to all diseases. As there are a million or so of plants — to say nothing of inorganic nature — still to be studied, there is evidently a wide field of work.

Bacterial diseases are not due precisely to the bacteria themselves but to products which they secrete in the course of their lives. The cure results from the blood cells rousing themselves to destroy the bacteria or to produce for the time or henceforth a set of chemical bodies which neutralize the secretions. A method of modern medicine consists in administering a very dilute or altered solution of these same secretions. Clearly homoeopathy. Dr. Richard Cabot recently remarked:

It has been perfectly just to charge our school in the past with the absence of any law or principle in therapeutics and to contrast the order and system in homoeopathic treatment with the helter-skelter omnium gatherum of merely empirical methods. Homoeopathy has a well defined law which has been established (like all laws) empirically. . . . We also, after groping and long years of work, have a law of therapeutics, a principle of therapeutic effort, namely, the principle of immunity, natural and acquired, and of the means whereby it may be attained, augmented, protected.

This principle, in most of its applications, it is difficult to distinguish from homoeopathy. But there is, notwithstanding, a difference. You could neither cure a case of strychnine poisoning, nor render a patient immune against

future poisonous doses, by the administration of very minute doses. But some of the anti-toxins do that for their respective toxins. We may remark, however, that the cost to the system at which this is done has never yet been worked out nor even thought of.

Perhaps the newer medicine, just beginning, is really feeding; supplying to the system in the exact form needed, the subtle foods of light in color, magnetism, electricity, and the various rays, of which it has been starved or which it has become unable to take up in the usual way. The uses of blue light alone, for example, are extending every day. Its most recent employment is for the healing of obstinate surface wounds, varicose leg ulcers, and the like. Sunlight strained through blue glass may be used, or the rays of the arc light. Red light, except to prevent the pitting of small-pox, is hardly yet a therapeutic agent.

Vegetalized Metals

HOW much of the medicinal and toxic effects of plants is due to metals which they have taken up into their protoplasm? The effects of alkaloids, when there are any, for example morphine and its relatives in opium, quinine and its relatives in cinchona bark, and so on, must be left out of account. The question applies to plants which are poisonous or medicinally effective, but which either contain no alkaloids or such as are practically inert.

Not many data have yet accumulated. The idea that some unusual metal, present in minute amount in the ash of a plant, may be the cause of the symptoms it produces, is rather new and unexpected. It is not sufficiently considered that when the plant is part of the daily food of animals, a very small dose will finally show very large effects; and secondly, that a metal woven into a plant's protoplasm and taken in that form by an animal, may possibly be much more active, physiologically speaking, than in its raw inorganic combinations.

The exceedingly harmful "Loco Weed," *Astragalus Mollissimus*, found all over the Southwest of this country and responsible for the death (by paralysis) of large numbers of cattle and horses, has recently been found to contain barium. The metal has been convicted on the following grounds: That the ash of the plant produces the same symptoms as the fresh leaves; that the symptoms correspond with those produced by barium itself; that the plant when grown in a soil containing no barium is innocuous.

"Trembles" is a disease causing considerable loss of stock, affecting the young (mainly) of wild as well as of domesticated animals. This has now been traced to the metals aluminium and magnesium in the plant *Eupatorium Ageratoides*, and the symptoms of the disease can be produced by their administration. The second of the two metals is of course a normal ingredient in plant tissues but this particular plant, as well as taking up aluminium, takes up an unusual proportion of the other metal.

The East Wind

A WRITER speaks of the bad reputation which he says the east wind has in Boston as a groundless superstition, brought over from England, where the east wind is cold from blowing over eastern Europe and the north of Asia. He ascribes many beneficent qualities to the east wind of Boston.

But one can hardly allow that the quality of winds depends only on the temperature and humidity, as determined by the climates over which they have arrived. There are other qualities in winds, depending on the direction from which they blow. These have always been recognized. An east wind is always an east wind, whether, as in England, it arrives laden with Siberian snows, or, as in California, hot and dry with desert sand. It produces the same kind of physiological and temperamental effect on one in both cases. The fact that it is an east wind seems to have a value apart from the temperature or dryness.

The four quarters have different characteristics. Ancient Science traced their correspondences with the different parts of the human body, with the planetary symbols, etc. Magnetism affords the clue to an understanding of this question by meteorologists. Magnetically speaking, everything has a dual polarity. Even apart from magnetism there is an ineradicable, undefinable difference between right and left, as seen, for instance in a right-hand and a left-hand glove. These two are exactly similar, yet strangely different. The two sides of a thing are not the same; they may be identical in form and all ordinary respects, yet in another way they are not the same. Similarly an east wind has some quality — call it magnetic, call it what you will — that is dependent on its direction alone and independent of other meteorological conditions. Superstitions are never baseless; they may be ever so wrong and perverted, but there is always a truth behind them.

Curing the Snake Bite

THERE is the story of a woman who was bitten by a rattlesnake. It was hiding in the woodpile when she went for a log. Her husband was away for the day and she knew she would be dead long before his return. The three children were all too tiny to send after him. She determined not to die with the house in disorder. All should at any rate be neat and clean against the widower's return. So she went through every room and

every corner, feeling ill enough certainly, but determined not to drop until all was ready. In the midst of it all she cooked the children's dinner, perspiring freely before the hot fire, and then returning to her work. Finally, everything arranged, she threw herself on the bed. "Now," she thought, "I may die." But after a few minutes it seemed to her that she was not feeling ill at all, only tired; and the bed was very restful. . . .

She woke suddenly at the sound of her husband's cheerful voice. In a moment the whole memory came back to her. She was not only not dead, but feeling very well. Her will and her work had saved her.

We were reminded of the story by Professor John Marshall's recent address on rattlesnake poison to some Philadelphia physicians. He has been studying that poison for five years, but has not yet quite ascertained what is its essential mischief. He went on to speak of treatment, remarking that the only good the usual whiskey does is to prevent the patient dying of *fright*. A rattlesnake cannot (he said) inject enough poison to kill (unaided by *fright*) a normally healthy adult.

Tie the limb above the bite, and suck the wound, are according to him the things to be done first. To which might be added, then enlarge the wound a little, connecting the two punctures by an incision, and fill with crystals of potassium permanaganate, rubbing them in. The rest is for the doctor. BOATS RACING IN SYDNEY HARBOR, N. S. W. AUSTRALIA

What is a Cord of Wood?

IT may be more or less than the 128-foot cord of the school arithmetics. It does not have to be 8 by 4 by 4, but must be 128 cubic feet. If the logs are 12 feet long, they will take up more room than if they were in 4-foot lengths, because they do not lie so close together on account of the curvatures. Consequently the buyer will purchase air-space with his wood. Also the lumberman will save on the sawing or chopping. Again, there will be a difference in the density of the pile depending on the straightness or crookedness of the logs. Chopping wastes more wood in chips than sawing wastes in sawdust. If the wood is sold by weight, green wood weighs more than dry. The drying of green wood results in a shrinkage which reduces the dimensions of a cord considerably or increases the quantity of wood necessary to make up a measured cord. All these factors have to be considered by the lumberman and must be taken into account by the purchaser.

100,000 Quail for London

ONE hundred thousand live quail recently passed through the Manchester Ship Canal on their way from Alexandria to London. They are imported by an Egyptian quail syndicate. It is stated that the breeding-ground of these birds is unknown; that they are trapped by Arabs who send them to the syndicate's depots on Egyptian railways. T.

'The Life of Richard Jefferies'
by Edward Thomas: A Review

SOMETIMES one of the Great Pagans will incarnate in a modern body, and be restrained and bothered by a modern brain; and you will see him shake off layer after layer of modernity and come nearer and nearer to the soul of his ancient greatness; and yet death overtakes him before he has been anything more than a promise for us. He has bloomed, and the bloom has lightened our skies, but fruitage was not to be; perhaps it would have been too great to be useful at the time, incompatible with our modern vulgarity.

Such a man, I think, was Richard Jefferies; and this book, the story of his life and work, is full of interest, and of something more than interest. It is stimulating, and even inspiring, as Jefferies was himself not less for what was omitted from his outlook than for what it contained. Your soul cries out for the knowledge of Reincarnation while reading it; nothing else would leave you without a sense of bitter tragedy. Why did not Jefferies know of it? and of Karma, which makes this seeming hopeless entanglement of life, beautiful, well-ordered and profitable? The man simply hungered for these teachings; *The Story of My Heart*, in particular, reads like a great cry and yearning for Theosophy. He was not without glimmerings of it either; Reincarnation at least he guessed at; witness what the brook told Sir Bevis, in *Wood Magic*—a passage of which Mr. Thomas has not, to our thinking, quoted quite enough. If Jefferies had lived, you would say, he must have come to it; with such splendid, sunbright paganism as was pouring forth from him more and more, such intense quest and demand for the "new heaven and the new earth." Mr. Thomas' comment only lacks knowledge of Theosophy to make it perfect. He has a rare beauty of style, exquisite perception, a Celtic sense of natural magic, deep insight into the subtler human values, full sympathy with his subject. All he needs to know is, that the growth he traces has not come to an end, and that the world will yet have more splendid things from the soul that was Richard Jefferies.

No one could deal with this man without an understanding of natural magic. He brought magic with him from of old; such things grow neither in rural Wiltshire nor in London. It burnt up around him, and he was within an ace of interpreting it; he was within an ace of setting this universe on spiritual fire, and lighting up its innermost realms. He was a strange palimpsest, with the modern script fading away as his life advanced, and magical runes visibly glowing from beneath them; heaven knows what secrets might have been beautifully revealed, if he had lived. The record of this growth and fading is here splen-

didly unfolded, and in the light of Theosophy becomes of ten times added interest; this waning of the farmer's son, loafing with his gun and earning the ill-report of his stolid neighbors, and this glimmering into vision afar of the sunlit Pagan—to be withdrawn or ever we could catch the full glory of his soul, or the word he came to say was spoken.

Wiltshire in England is a queer country, one would think, for a great Pagan to choose for his incarnation; yet there is something about it that is singularly fitting too. It is a dual-natured land essentially. There are fat, comfortable, green lowlands of wheatfields and copses and slow streams; indolent fields, and an unmystical, slow-speaking people. For background to these there are always the austere druidic Downs—close akin to those other Downs, a little southward from his birthplace, where Stonehenge stands for a monument to the Ancient Wisdom. A world austere, druidic, simple, and with no touch of vulgarity; no fairyland, but a land where the wind is always blowing beneath immense reaches of sky—neither the prairies, nor the Alps, nor the sea gives one such a sense of wide-spreading immensity lavished on all sides. You will still find there, rare in England, oxen yoked at the plow, and good, thatched walls about the farms. Things modern have no play there, and yet you would not lightly call it beautiful, old acquaintance must come first. Nature is reserved, and not prodigal of her revelations. Jefferies was of this land and yet not of it; he grew up in it, and out of it. He came to it from elsewhere, "trailing clouds of glory."

And then there was London, with its perpetual thunder and pounding and whirl of life; London, where he spent several years, and which he loved and hated; which attracted and repelled and fascinated and set its spell upon him, and whose soul and color he illumined with such magical phrases. "It was not the least of the city's praises," says his biographer, "that it was part of the culture which made Richard Jefferies' mature work memorable." That is true; London doubtless helped in the wearing away of the sheaths, but the sword was not forged there. Nor yet in Wiltshire. He was a child neither of the valleys nor of the Downs, except externally. There is no Richard Jefferies' country but Hy Brasil and the Gwerddonau Lleon and the Purple Islands. His inward man was from sunlit realms and ages; the rainbow and the sunset gleamed through his being, a passion of light and color.

Young Jefferies lounging through the fields and copses, with the commonplace passion for killing, the commonplace faith in juicy steak and strong ale, the commonplace reverence for the established order of squire and parson—what a sloughing away has taken place before the end! There were certain things he did not drop, truly; that Greek delight and keenness of sense-perception, reaching down in its lowest aspects to belief in steak and ale and the like, embracing an intense admiration, very Greek, for beauty of form—that creeps in always, he never grew beyond the possibility of it; and often the reminiscence of it jars a little amid the spirituality of his later writings. There are things still to be sloughed off; thank the Great Law for Reincarnation! But the gun, and that moral eye-cataract that makes the gun desirable, are quickly dropped;

and he follows the wild things for the keener sport of observing them, with sympathy for a microscope. He goes with the Mighty Mother till she has called up the love out of him, and that works like balm through his being. Isis or Demeter or Ceridwen takes hold upon his soul among the Downs, and begins unrolling the Mysteries before him. And the conventional rural-English attitude towards humanity is dropped, and he becomes a passionate lover of mankind, possessed of a passionate yearning for human growth and evolution and solidarity.

Would that it were possible for the heart and mind to enter into all the life that glows and teems upon the earth—to feel with it, hope with it, sorrow with it, and thereby to become a grander, nobler being. Such a being, with such a sympathy and larger existence, must hold in scorn the feeble, cowardly, selfish desire for an immortality of pleasure only, whose one great hope is to escape pain. No, let me joy with all living creatures; let me suffer with them all—the reward of feeling a deeper, grander life would be amply sufficient. . . . Let me have wider feelings, more extended sympathies; let me feel with all living things, rejoice and praise with them. Let me have deeper knowledge, a nearer insight, a more reverent conception.

I am a pagan and think the heart and soul more than crowns.

This blade of grass grows as high as it can, the nightingale sings as sweetly as it can . . . the great sun above pours out its light and heat in a flood unrestrained. What is the meaning of this hieroglyph, which is repeated in a thousand ways and shapes, which meets us at every turn? It is evident that all living creatures, from the zoophyte upwards—plant, reptile, bird, animal, and in his natural state, in his physical frame, man also—strive with all their power to obtain as perfect existence as possible. . . . All tends to one end, a fuller development of the individual, a higher condition of the species; still farther, to the production of new races capable of additional progress. Part and parcel as we are of the great community of living beings, indissolubly connected with them from the lowest to the highest by a thousand ties, it is impossible for us to escape from the operation of this law.

The physical and mental man is . . . made up of the Past. This is a happy and inspiring discovery . . . which calls upon us for a new and larger moral and physical exertion, which throws upon us wider and nobler duties, for upon us depends the future.

But it . . . is necessary that some far-seeing master-mind, some giant intellect, should arise, and sketch out in bold and unmistakable outlines the grand and noble future which the human race should labor for.

One might go on quoting indefinitely, but for lack of space. It is possible for the heart and mind to enter into all life, and joy and suffer with all creatures; all our experience and life on this earth are simply to teach us how to do this; we are widening our consciousness continually; going from strength to strength, until our being shall include the whole expanse of life and time, as Jefferies beneath the chestnut-tree dreamed it might. We are a part of evolution, and cannot escape from the Law; we must go forward, but of our own will, and consciously; we *are* called on to use that "new and larger moral and physical exertion." And when H. P. Blavatsky mapped out Theosophy for the world, and when Katherine Tingley took up the direction of this great Movement, the master-mind that Jefferies foresaw and called for, was (and is) actually at work in the world.

How the man would have rejoiced in the Râja Yoga educational system, which aims at, and hits, just the mark he proclaimed with his lyric glory of prose—greater soul-life.

more excellent bodily life, firmer will, brighter mentality; a balance of all the faculties. Read that glorious prayer in *The Story of my Heart*; that Pagan invocation of the beauty of the world and the soul of himself and the world; and then turn to the Râja Yoga schools, and say if the thing does not look like a carrying out of the best part of his best ideals, with something added, in a brighter manner than he himself could have realized the possibility of. Jefferies, Jefferies; you ought to have listened better to the brook; it hinted great truths to you when you were little Sir Bevis! You will come again as it said; you will see all these things which you prayed, but hardly dared hope for.

For be it said, you cannot read this biography, as you cannot read his own later books, without coming to know the man; he remains a friend, in whom you take warm interest. Of only a few other figures in literature can it be said that the heart-beat is to be heard so distinctly in their prose. Jefferies loved greatly; loved Nature, not scientifically, but as a devotee; she was for him, in his deepest moods — for he varied — a great Mother Goddess, whose being could be drawn into one's own so that the glory of sun and sea and earth should be wrought into the human fabric, glorifying it, erasing the harsh boundary lines of consciousness, killing out the heresy of self, and making one a part of the whole. "He has discovered something divine in Nature," says Mr. Thomas, "with which he cannot reconcile men as they are." No; but he had a vision of men as they would be, as they are to be, replete with soul-life, one with the divine in nature; he saw it and recorded it, and the record stands; read and be enriched! Was he not also among the prophets? Is not his doctrine, the highest part of it, one of the needs of the world? Even if he failed to bring it to its fulness and glorious conclusion; even if the modern man, the materialist, the doubter spoke out sometimes; and he could see no prospect of the fulfilment of his aspirations.

One puts down this life of him with a sense of having seen more deeply into the heart of man; of having gained a fresh insight into the methods of evolution; above all, with a new knowledge of the world's need for Theosophy.

THEOSOPHICAL FORUM

Conducted by J. H. Fussell

✽

Question How can one learn to understand the spiritual nature of man and the Universe?

Answer No doubt the best way is by watching life and studying it very closely; and exerting oneself to help it come towards its goal. Life is the exterior and indication of the Spirit; the smooth surface of a water, reflecting innumerable shadows; do but re-focus your eyes, and gaze down into it, and you shall see all the mysteries of the kingdom of heaven.

You see, we are in the swing of evolution, and have a certain definite and honorable place. Link by link the least of us is connected with the regents of the stars. We find ourselves in the midst of two infinities, an ex-

ternal and an internal one. In the first, life goes down through worlds and worlds below us; kingdoms upon kingdoms mindless and unimpassioned, with yet the Spirit and life stirring through them all; for there is no dead matter, but all things are alive and busy with the work of evolving. Life is learning its lessons in the mineral world, and therein approaching ever nearer to the vegetables; these to the animals, and the animals to man; man in his turn to the realm of beings that transcend him; and so on till you have come to summits of amazing power and glory. In the infinity within us we stand midway between a topless heaven and an unfathomed hell; we can cultivate either, and grow into the being of either.

We ought to know, that the outward stream of evolution is dependent upon the inward; and as we climb that steep path within ourselves, all creation is hurried forward. Here then is the secret of secrets to be learned, this matter of going forward and surmounting evil; "he who doeth the will shall know of the doctrine."

We know of two combatants within us. Sometimes we are far removed from their struggle, in a kind of vacuous peace; this is perhaps the most general condition. Again, we will hear the shock and distant booming of them at battle: at other times we are brought nearer and clouds roll away from the field; we are forced to take part, and feel the whole pain and anxiety of the conflict. Could we but maintain ourselves there, allied always with the brighter side, all our real troubles would have vanished; for it is the waste time mainly that counts against us, when our substance is given over to externals and miserable trifling.

It is the warfare of the divine soul in man against selfishness; Kurukshetra fought eternally, the Battle of the World. The Soul is out, and the clans of gods are gathered; are we not to be there upon the field? There shall be no victory without our presence; is anything of like importance with this? On the one side is that which is our very self, "eternal in the heavens"; on the other, that which was born and is to die, the personality with its limitations, desires and contemptibility. We mean this personality, commonly, when we say "I"; it is a poor thing to be identified with; high time now, that we sought something better.

The task is, to break down selfhood and become universal; to which end, of course, compassion must be the road. It leads out of self, into wider self-identifications; it is the key, the spell, the staff and the pathway. The first mark of the soul is universality. The soul sees the goal of its strivings, a humanity without fear or reproach; through the ages it has sought the same end. Lesser motives hide us away from it; it cannot know them at all. The things we seek to do and get for our own advantage, from heaven to the most momentary animal gratification, from fame to pleasure; they are not worth even to be moralized over; they are not food for the soul. One rejects candles, having companionship with the great sun. Is there not here a path marked for our advance?

Whatever place we may hold in life, with whatever ordinary duties, that and they will serve for our training and liberation. One

has something to do? Let him invoke the soul then, in the doing of it; let the action be enlightened by all the mysterious excellence of the soul. Carelessness must be laid aside, and all the wandering, ineffectual habit of the mind; every legion of one's being must be ranged, and the thing done, so to say circumstantially, to the utmost of one's power. The hugest interests are involved in even the least actions: is the soul to get some new grip on the material world, through the way you sweep that floor, or add up those figures; or only fresh bafflement and loss? Either is possible. In every duty, you may parallel Prometheus, and bring down fire from heaven: the thing is worth waking to; indeed it is.

Our actions, we are told, must be dedicated to the Soul of the World, and done for humanity's sake, not for our own. The world's work has to be done, and we have to do our share of it. We do; and contrive that nearly all of it shall be directed, not to the world at all, but to ourselves. We *have* to work, we say; it is a painful necessity put upon us; the result of (we used to say) the fall of our first parents—we have to work in order to live.

It is the wrong end of the stick that is in our hands; we really have to live in order that we may work. Go from anywhere to anywhere, and look with open eyes at the amount of work that remains to be done. You shall see so many people; every one of them has to grow within himself the qualities of the hero and the savior. You shall see perhaps some blind distortions of souls, warped, abortive fragments of humanity; these, too, must become—no, not merely respectable citizens; give your imagination the reins, and go much farther than that—they must transcend all that we know for wisdom, strength, compassion. And then the dirt that must be cleaned away, the vile places that must be changed, the hideousness that must be made beautiful—is there not enough work to be done?

Get to it, with both hands; above all with a heart desiring to give, not to get. Strew the world with a bounty of thought; though a sound of it never be heard, there is no one shall not be enriched. This is the meaning of dedicating our actions to the Soul of the World. Our usual method is to consider the world as an orange to be sucked.

Thus our motives come to be directed away from self, which is the only block there is to our understanding. STUDENT

MANY men have arisen who had glimpses of the truth, and fancied they had it all. Such have failed to achieve the good they might have done and sought to do, because vanity has made them thrust their personality into such undue prominence as to interpose it between their believers and the *whole* truth that lay behind. The world needs no sectarian church, whether of Buddha, Jesus, Mahomet, Swedenborg, Calvin, or any others. There being but ONE Truth, man requires but one church—the Temple of God within us, walled in by matter but penetrable by anyone who can find the way; *the pure in heart see God*.

The trinity of nature is the lock of magic, the trinity of man the key that fits it.—H. P. Blavatsky, in *Isis Unveiled*, vol. ii, p. 635

THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY

FOUNDED AT NEW YORK CITY IN 1875 BY H. P. BLAVATSKY, WILLIAM Q. JUDGE AND OTHERS
REORGANIZED IN 1898 BY KATHERINE TINGLEY

C e n t r a l O f f i c e P o i n t L o m a C a l i f o r n i a

The Headquarters of the Society at Point Loma with the buildings and grounds, are no "Community" "Settlement" or "Colony." They form no experiment in Socialism, Communism, or anything of similar nature, but are the Central Executive Office of an international organization where the business of the same is carried on, and where the teachings of Theosophy are being demonstrated. Midway 'twixt East and West, where the rising Sun of Progress and Enlightenment shall one day stand at full meridian, the Headquarters of the Society unite the philosophic Orient with the practical West

Various Views on the Educational Problem

Scientific Feeding of School Children

THE education bureau recently issued a bulletin recommending a diet for children, to be adopted by all parents and guardians who may wish to do so. From the age of six to nine the daily diet is 50 grams of protein, 75 grams of fat, and 175 grams of carbohydrates. In a certain school a cup of milk and a graham cracker are given at 10.30 A. M., just before which the children must rest for a few minutes with head on desk. The schedule for the day includes a medium-size orange, a third of a cup of oatmeal, half a cubic inch of butter, 1½ ounce of edible white fish, one small potato, three-eighths of a cup of celery cooked in milk, three prunes cooked with one-half level teaspoonful of sugar, and some other items.

This elaborate care over the single detail of feeding may strike one as being of the nature of a new patch on an old garment. Important as is the proper feeding of the body, how much more important is the proper feeding of the mind and moral nature! Until these last are as carefully regulated, there is but little to hope from the first. A moral diet of indulged weaknesses, and a mental regimen of comic supplements and police news, will do more damage than the best regulated physical diet can repair. Such a diet as those prescribed above belongs to a school in which the children would be equally well provided for in all other respects. In such a school it would be in place and would stand a chance of being effectual; though, be it noted, if the children were better guarded in those other respects, it would not be necessary to be so scrupulously careful about the diet.

Another point is that the theories about the amount of proteids, carbohydrates, etc., required, are both various and variable, and there cannot be said to be any exact science in this respect so far.

The Boys on the Street

A UNITARIAN clergyman said that the greatest need in his town was an institution where the young could be gathered under skillful leaders and trained to higher morals. The streets were infested with juvenile loafers learning everything bad. The boys needed to be won from vicious habits by innocent

MEMBERSHIP

in the Universal Brotherhood and Theosophical Society may be either "at large" or in a local Branch. Adhesion to the principle of Universal Brotherhood is the only prerequisite to membership. The Organization represents no particular creed; it is entirely unsectarian, and includes professors of all faiths, only exacting from each member that large toleration of the beliefs of others which he desires them to exhibit towards his own.

Applications for membership in a Branch should be addressed to the local Director; for membership "at large" to G. de Purucker, Membership Secretary, International Theosophical Headquarters, Point Loma, California.

counter-attractions and by methods that would preoccupy their natures with the pure, the noble, and the true. If present conditions continued, the safety of life and property would be more and more imperiled and every sacred interest of civilization would be seriously threatened. Something must be done to take the children off the streets. He blamed the parents for not supporting the church and thus enabling it to do more.

This shows that there are more urgent educational questions than the diet question. As to supporting the churches, when the parents see something more worth supporting, they will be readier to support it. Church teachings are not nearly potent enough to stem the rushing tide.

Education Includes Play

THE superintendent of a playground association points out that the Athenian youth was educated chiefly in the playground. The lad entered the palaestra at seven, and the first part of the day was spent in gymnastics, dancing and games. The reading was done in the open air. All through the school years, physical training was made a dominant feature. And the ancient Greeks were of such a high type that Galton said they were as much in advance of the modern Englishman as the latter is in advance of the native African. So the superintendent makes a plea for much attention to the games of school children, for education is not confined to literary instruction, but should comprise everything we can do for the child. Environment is teaching him every moment of his life; so that, unless the teacher follows him in these moments, the teacher's part in the business is small.

He also thinks we do not pay enough attention to the strong and healthy, and that it almost seems necessary for a child to be infirm or incorrigible in order for him to be properly attended to.

School education is given on the assumption that the parents provide the rest of the

training. But the modern parent does not seem able to deal with the modern child. The superintendent must remember that the ancient Greek parent was willing to forego a good many things which we regard as inalienable domestic rights, and that Grecian states did not exalt the individual to such an extent as we do. How far are we

prepared to modify our conception of the child as personal property, in favor of the notion that he is an asset of the nation? We admit the advisability of the state stepping in to control the use of many kinds of property, which otherwise would be used to the public detriment; and the state has stepped in and insisted on giving all our children a literary education. There seems a trend towards giving the state a more general supervision over them; for circumstances are driving us that way.

But the Greeks inherited, along with the physical beauty which they sought to keep up, some sage teachings from the ancient Wisdom-Religion. They believed in the innate divinity of man and had schools of initiation to the deeper mysteries of life. But we have only our warring creeds and our speculating science for guides; and blind leaders of the blind they are! Where are we to find that touch of the divine that infused joy, beauty and harmony into the ancient world? How can we impart to our children that one of the three essentials of education known to the Greeks as *μουσική* and most inadequately translated "music"? We have it not in our lives — the balance, the calm, the joy and health.

A renewal of the old Wisdom-Religion is essential, that we may have teachers who will have something to give the children. H. T. E.

It is only our unrest and the unrest of the age that turn our eyes away from the light within. It is by endeavoring to do the great things rather than the small things that we fail to find and follow the Law, that we fail to realize that our hearts are pulsating every moment in harmony with the finer forces of Nature, which are at our command, and with the inexpressible and unseen vibrations of life. To be attuned to these things, to know the Law in thought and feeling, to feel its inspiration in every act — is to have spiritual knowledge.—Katherine Tingley

Isis Theater Meetings Discontinued Until September

THE meetings at the Isis Theater, San Diego, every Sunday evening, have been discontinued until September, as has been customary each year during the summer months.

The Relation between the Earth and the Moon

THEOSOPHY neither seeks nor needs the support of the ever-changing theories of scientific thinkers, and Theosophists, while steadily pursuing their work of enlightenment, are content to wait in patience until the world shall arrive at such an intellectual position that its leaders in science and philosophy will be compelled by the conditions arising to look to the age-old Wisdom-Religion for the deeper laws of nature and the real meaning of human life.

H. P. Blavatsky has said that while the teachings she gave in *The Secret Doctrine* and elsewhere would be disregarded by most of the representatives of science in the nineteenth century, the time was not far distant when they would begin to be valued at their true importance. She also said that although what she was offering was merely an outline of some of the ancient teachings of Theosophy concerning man and nature, enough was given to place the duly qualified student upon the right track, and that when the world had found the need for Theosophy a much larger rent in the veil of Isis would be made. Till then the deeper teachings can only be given to tested individuals who have been tried and not found wanting, and who will not use them for selfish personal ends.

H. P. Blavatsky was quite fearless in declining to make the teachings "subservient to, if not entirely at one with, modern theories," as some of her more half-hearted followers desired. She said they are strong enough to stand upon their own feet, and do not need to be "checked by the speculations that blossom forth today, to die tomorrow—on the shifting sands of modern scientific guess-work." That she never tried to emasculate truths unpalatable to the materialistic temper of the nineteenth century is a valuable testimony to her high and trustworthy qualification as a Teacher. How wise this was, is daily becoming more apparent to careful observers of the trend of thought, for in the past twenty years many unexpected surprises have modified the opinions of scientists, and new discoveries are irresistibly pushing them closer and closer to the methods and principles presented in her works.

Though we may have to wait a long while before the spiritual basis of natural phenomena and the intelligent *intra-cosmic* guidance of natural forces are generally recognized, it is very interesting to the student of Theosophy to watch the gradual and partly unconscious movement towards Theosophy.

THE MOON IS OF IMMEASURABLE ANTIQUITY

A significant instance has just been brought to our attention. One of the Theosophical teachings is that the moon belongs to an evolution older than that of the earth, and that it is not a portion of the earth, jerked off when the whole mass was fluid, and (hypothetically) rotating at a terrific speed. In *The Secret Doctrine* it is stated that the moon ex-

isted as an inhabited globe long before the earth was fit to support life, and that when its time had come, its life and energies were transferred to the earth, its corpse being left to disintegrate in the course of ages.

MANY DIFFERENCES BETWEEN OUR MOON AND OTHER SATELLITES

Several peculiarities of the earth-and-moon system have been discussed by astronomers without any satisfactory conclusion being attained. The great size of the moon in proportion to the earth as compared with the other systems, the fact that the inclination of its path lies at a considerable angle with the plane of the equator of its primary, the earth, and the curious nature of the curve of its orbit around the sun, are circumstances not found in connexion with any other planetary sub-system. The satellites of Mars, Jupiter, Saturn, Uranus and Neptune are extremely small in proportion to their primaries, and nearly all of them travel in planes parallel to the equators of their respective planets, and in cycloidal curves not resembling the path of the moon.

In spite of many difficulties and the absence of definite proof, the theory advanced by Sir George Darwin in 1879, that the moon was once a part of the earth, has been provisionally accepted by astronomers. In *The Secret Doctrine* (1888) H. P. Blavatsky wrote a sentence which looks strangely prophetic today. Criticising Professor Darwin's hypothesis adversely, in view of the more accurate information in her possession, she said it was not true "even if the fact has not yet been ascertained by mathematical calculation."—(Vol. I, p. 155.)

THE MOON IS NOT THE CHILD OF THE EARTH

And now we find one of the most brilliant mathematical astronomers of today, Professor T. J. J. See of the United States Naval Observatory, Mare Island, claiming to have demonstrated by incontrovertible mathematical calculations based upon the recent methods of Hall, Poincaré, and Darwin himself, that the moon is not a detached portion of our globe but is, and always has been, an independent planet. Professor See is the same authority quoted in the *CENTURY PATH* for March 7, 1909 in connexion with his new theory of the origin of the Solar System, which demonstrates principles of world-building approximating somewhat to the Theosophical teachings. The following quotations from a statement just published by Professor See will sufficiently explain his position:

This new view of the mode of formation of the solar system has not been disputed anywhere, for the proof was conclusive. But the new theory was so different from that heretofore taught that it has aroused great interest among men of science, both in this country and in Europe. Now we have for the first time conclusive proof of the way in which the satellites were captured. It was clear to me last November that they had not been detached or thrown off from the planets, as Laplace supposed, and as they had not been thrown off by rotation it was fairly clear that they must have been added on from the outside or captured.

Yet this point was so important that I did not rest content till I had obtained a rigorous mathematical demonstration of how the captures had come about.

Heretofore it has been very generally believed that our moon was a part of the earth, thrown off by too rapid rotation. This theory originally dates back from the Greek philosopher Anaxagoras, who lived in the age of Pericles, 444 B.C.; but it has been especially credited to Laplace, 1796, when his

nebular hypothesis was published. It has been even more generally believed since the famous investigations of Sir George Darwin were published by the Royal Society of London in 1879. Now it is disproved, and we have for the first time a correct idea of the origin of our moon. It is nothing more or less than a planet which came to the earth from celestial space. On this point there is not the slightest doubt. . . .

When the moon first came to the earth it was about twice as far away and looked about a quarter as large in area as at present. In the course of many millions of years it has gradually neared the earth and it is still getting closer, but the movement is nearly insensible, amounting to about 45 feet in 2000 years, or about a quarter of an inch a year. This small movement is of no practical consequence, but of high scientific interest because it helps us to understand the past history of the universe.

Space will not permit the quotation of the Professor's interesting description of the method by which the moon lost its independence and came under the sway of the earth. He, of course, says nothing about the relative habitability of the earth and moon at the time of capture. The essential interest for students of Theosophy lies in his conclusion:

Thus, Darwin's theory of the moon's detachment from the earth is overthrown, and an entirely new theory developed which has the support of all the highest mathematical science now known.

Does Genius Depend on the Muscles?

A DOCTOR is reported to have announced the theory that genius depends upon the proper working of the body muscles. The mental difference between a Goethe and Schiller can be explained in this way. Undoubtedly there is a connexion between the mind and the body; undoubtedly each influences the other; undoubtedly each can be affected by giving attention to the other. But which of the two is superior? There is only one possible answer to this question; for without the mind there can be no theory and no practice. The mind must always be first, whichever way we argue. The mind can develop the body, but the body cannot develop the mind. Whether we train the mind through the body or the body through the mind, it is the mind that is the prime mover in either case. This is the way in which materialism stultifies itself: the mind denying its own existence.

But the only way to see through such problems is to recognize that the mind is not a single thing but composed of various parts. One part of the mind may be under the control of bodily conditions, but another part is not; otherwise man would be a perfect automaton, as unable to reason abstractly as are the animals. We permit our lower mind to be swayed by bodily conditions, and all the time the higher part of our mind keeps independent and protests. Our business is to rule the lower mind by the higher; and when we can do this, the lower mind will rule the body. At the same time the process of gaining control over the lower mind can be much assisted by proper attention to the body along the lines of ordinary medical common sense. STUDENT

Indian Solidarity

ACCORDING to an exchange, when the Indians use the telephone, they do not call up any particular person, but merely "Any Cheyenne," or whatever their tribe is. Any member of the tribe will do. The recipient of the message has to deliver it, no matter if it requires a night journey in a

storm. When a telephone manager receives a message from an Indian, he can go out on the street and bring in any member of that tribe to receive it.

This is a fine instance of solidarity, harder to achieve, perhaps, in large communities than small, but worthy of emulation and surely not impossible. If the Indian were of a calculating mind, which probably he is not, he could argue that favors balance themselves in such a system. But, if we think of society as a whole, instead of as a collection of units, we do not have to make such calculations of payment and repayment.

We have our ideas of solidarity and individualism considerably mixed up. If we could assert our individuality a little more when duties are in question, and our solidarity a little more when the question of privileges arises, we would strike a better balance.

STUDENT

Laboratory-made Food

THE advance in the price of bread, says the *Lancet*, due to financial operations, has turned the minds of chemists to the possibility of making food artificially.

There seems to be a *non-sequitur* here. How the making of food in a new way is going to prevent financial operators from making corners is not very obvious. Could they not corner the artificial bread as well?

Continuing, the paper expresses the opinion that, if ever we are able to make foods in the laboratory without the aid of animal and vegetable life, the process will be enormously more troublesome and costly than the natural processes. And it adds that

The fact is, chemistry succeeds better in the work of destruction than in the work of construction.

The forces with which chemistry deals are principally lower orders of "lives" which belong to the destructive side of nature and whose function is to break things up. The synthesizing lives are those which inform the vegetable and animal kingdoms. It might be possible to call such agencies into play in the laboratory, but it is probably much easier to do it in the ordinary way by agriculture. Another point is that the artificial foods might not be precisely the same as the natural; for the settlement of this question depends on the correctness and completeness of our analysis of the natural foods. And here it is not enough to know into what substances a food may be broken up; the substances which it yields do not necessarily give a complete clue to its character before analysis. We require to know about its structure in what way these products were combined. Bread may yield, on analysis, so much starch, so much gluten, and so on; but still, with all the ingredients, and in the right proportions, we might not be able to make bread. And even if we could make a food which to us seemed exactly similar to the natural product, still it might be different from it in some vital particular of which we are not aware. We cannot be sure of this unless we can certify that our knowledge of the composition and structure of the food is complete and exhaustive. And who will dare to say this at a time when our knowledge is constantly increasing and our opinions ever varying?

One would be afraid that however similar

the artificial food might be to the natural in a chemical sense, still there might be lacking some subtle essence beyond the power of chemistry to detect. Indeed one fears that it may be so already in some cases. It is open to question whether some of our substitutes for natural living are as good substitutes as they have been believed to be. Man needs warmth and air, we say; and so we warm some air and pump it into his rooms. But somehow we have only half succeeded. The sun gives light and so does the electric arc; yet the light from the latter is said to injure the health in a way which the sunlight certainly does not.

T.

Fallibility of the Senses

SCIENTIST records this peculiar defect in his color-sense. It is normal except that sometimes his sensitiveness to red is suppressed. As soon, however, as his attention is called by somebody to the fact that the object which he sees is red, his eye responds and he sees the object in its true color.

It would be difficult to explain this on any mechanical theory of sense-perception. We

TRANSFORMATION

FOR as a stone, so Eastern legends run,
Woody by unwearied patience of the sun
Piercing its dense opacity, has grown
From a mere pebble to a precious stone,
Its flintiness impermeable and crass
Turned crystalline to let the sunlight pass;
So hearts long years impassive and opaque
Whom terror could not crush nor sorrow break,
Yielding at last to love's refining ray
Transforming and transmuting, day by day,
From dull grown clear, from earthly grown divine,
Flash back to God the light that made them shine.

From the Persian of Jalaluddin Rumi.
Claud Field in *The Spectator*.

should have to imagine the voice of the informer striking on the tympanum of the seer's ear, from whence vibrations would run along the auditory nerve to a brain-center and be communicated to another brain-center controlling the eye. Very cumbersome; it is so much simpler—which means truer—to say that it is the mind which sees the color and the mind which receives the information from the informer and corrects its judgment accordingly. It is far easier to explain matter in terms of mind than mind in terms of matter.

The untrustworthiness of the senses is strikingly brought out in the above case. A prejudice in the mind can affect them. Many experiments have been made which prove to what an extent our perceptions are influenced by our preconceptions.

T.

Races and Brains

SCIENTIFIC men often use arguments in which there are suppressed terms, these suppressed terms probably being regarded by them as axiomatic or indisputable, and being accepted by the public as such without inquiry. Thus their arguments acquire an apparent force which vanishes when we come to examine these tacit assumptions.

Thus, a professor is reported as having found that the average brain of a certain race

is larger than that of a certain other race; and having concluded therefrom that the former race would remain dominant. This argument involves two assumptions. The first is that a race having a larger brain will continue to have a larger brain. But why should we accept this proposition? Is it true? Yet, if it be not true, the argument fails. The other assumption is that the largeness of brain causes the dominance. But it might be held that the reverse is the case and that the dominance causes the largeness of brain. In this case also the argument fails.

Does a race have a larger brain because it has a stronger character, or does it have a stronger character because it has a larger brain? If the latter, then it would seem that we are at the mercy of physiological processes, operating through physical heredity; and it is no wonder, therefore, that the professor should have found it convenient to assume that the size of the brain will remain undiminished, and that the race will consequently continue to have the dominant character. But the other alternative seems preferable—namely, that the size of the brain is determined by the character, the dominant race having the larger brain because it has the stronger character, and the weaker race having the smaller brain because its character has been less developed.

In this case it behooves the dominant race to look after its character and to remember the fable of the hare and the tortoise. While it is priding itself upon its bigger brain and its present dominance, due to conscientious effort in the past, it may allow its force of character to deteriorate; and meanwhile the other race may make good use of its opportunities and develop its character until it has the larger brain and becomes dominant.

Races do improve; and races do degenerate; and along with these processes go the corresponding changes of physique. And the power which decides whether a race shall progress or retrogress is usually (particularly in dominant races) aspiration and effort.

We look too much at what people are, and not enough at what they may become. They may become better, we may become worse. And races are larger men, with a longer life. And our labeling is wrongly done; let us keep down what is evil, whether in ourselves or others; and promote what is good, whether in ourselves or others.

STUDENT

Carriage-Craft of the Egyptians

IF there is any branch of mechanical construction in which we feel sure of our modern advance, it is carriage-wheels," says a writer in the *Scientific American*. Yet there is a chariot in the museum at Cairo, of date not less than 3300 years ago—taken from the tomb of Ouyia and Tuiyou three years ago—with wheels exhibiting not only our "modern improvements," down to the most approved method of securing the lynchpin, but also some elements that would repay study in our day. Though a funerary chariot, it was built in imitation of a racing one, and in this connexion the length of the hub and mode of building the tire are suggestive. If man's intelligence be gaged by his skill in carriage-craft, it must have been very active during the first 2612 years from the theological date of creation.

STUDENT

Art Music Literature and the Drama

Pedro Calderón de la Barca

SPAIN, though for the past few centuries in a dormant condition, was during the sixteenth century the channel of the most powerful forces of European life. Here chivalry flourished, an exquisitely natural expression of valiant, generous, and noble sentiment. It was a nation of vigorous, large-minded men who aspired to extend their influence over the whole world; one movement carrying them to the Americas, the other supporting Emperor Charles the Fifth, the greatest monarch of that day, in his gigantic scheme of uniting all Europe under one imperial régime. Unfortunately the black and selfish forces of mankind attack those nations where the spirit of progress is most alive. Nevertheless, this vigor of national life produced an outburst of literature in Spain which equaled that of the Elizabethans in England. The drama, from the time of the immortal productions of Aeschylus and Sophocles, has afforded the greatest possibilities for literary expression, and Pedro Calderón de la Barca is styled the "Prince of the Spanish Dramatists."

Of insignificant parentage, yet Calderón received a good education in the Imperial College of Letters and Art in Madrid and also at Salamanca. As a youth he was fond of roaming about with the imperial army, and it was at this time that he produced his comedies which were so full of wit and vivacity as to bring him into public notice. Furthermore, as was the custom of the times for young authors, he took to the stage himself. After his early years of a romantic and exuberant nature, he seems to have suddenly quieted down at the age of fifty and entered upon a life of retirement which afforded more leisure to carry on his literary pursuits. Calderón became known far and wide as the genial, loving friend, the benefactor of the poor, the discreet counsellor, the bright and charming companion, in short a most worthy citizen.

Calderón was but thirty-six when his already well known dramatic and literary ability attracted the attention of the King of Spain and he was summoned to the court. Felipe IV stands out in history as one of the greatest and most sincere among royal patrons of art and literature and it was while at his court that Calderón wrote his masterpieces. They present a marked contrast to very much of what passed for the highest literature in seventeenth century Europe because of the purity of tone pervading them. To ribaldry, licentiousness, the exploitation of low ideals of honor, in short, to any of the derelictions that

a certain type of poets, dramatists, artists, and even musicians in all ages have excused with that little shibboleth, "Art for art's sake," Calderón would not and did not descend. There was in his mind and heart a deep-flowing current of purity, and had he better understood his own nature, had he possessed a knowledge of the true philosophy of life, he might have done for the world-drama as a native of Spain, what was done for it by Aeschylus the Greek, by Goethe the German, or by Shakespeare of Elizabethan England.

As it was, Calderón, after only a few years, comparatively, at Felipe IV's court, left it to enter the Church, and from that time on he composed only religious plays. These, called

able. Calderón's metrical forms were simpler, in general, than those of his contemporaries, while his constructive genius, as shown in the architecture of his plots, marked him as unique.

Of the dramas and poems of Calderón, 122 in number, nearly eighty were *autos*, or plays devoted solely to furthering the doctrines of the Church of his day. For thirty full years he devoted all the energy of a pure, honorable, and intensely zealous nature to sectarian religion and to what he conceived to be his duty towards it. What he might have done, had he stood forth spiritually free and unhampered, it is difficult to prophesy. There was little freedom anywhere in his day.

Lomaland Photo. and Engraving Dept.

THE ARCADE DU CINQUANTENAIRE, BRUSSELS

autos sacramentales, are not unakin to the Mystery Plays and Moralities of early England. Yet with all their limitations as to form and idea many of these contain passages of superb poetic beauty. Perhaps the best-known of Calderón's religious dramas is one based upon the medieval legend of a magician who bargained away his soul to the Evil One. Goethe later used the same legend as the theme of *Faust*, but the German poet wrote down a solution of life's mystery which Calderón, mentally limited by the arrogant ecclesiasticism of his day, failed to do.

Even the happiest English translations of Calderón fail to render the musical beauty of the Spanish idiom in which they were written, for while using freely the complete rhyme, he fairly revels in the assonance, haunting and elusive in its loveliness, and of which the English tongue is, if we are to trust the internal evidence of our poetry as a whole, incap-

Living just after the nation had passed through its most intense period of activity, that is, in the seventeenth century, he was not so much urged to give immediate vent to the fiery, optimistic vigor of contemporary ideals and events, as to produce a truthful representation of life in all its aspects, taking advantage of the vista his predecessors had opened up into the potent and vital realities. He was enabled thus to create from the viewpoint of the universal. Of the more distinguished predecessors to whom he was indebted he combined in his works the natural force of Lope de Vega, the boldness of Tirso, the formal nicety of Moreto, the realism of Alarcón, the gorgeousness of Rojas. As a philosophical poet he equaled Cervantes. He is to the Spanish tongue what Shakespeare is to the English. He expressed things divine in forms most poetical and beautiful. In short he was of the caliber of a Dante, a Homer, an Aeschylus. R.

"Because there is no harbor in sight, do you deny that there is a harbor?"

Theosophical Work

WHAT is it? Who does it? How and where is it done? What is its object? its result?

Anyone who has watched Theosophical workers and seen and considered Theosophical achievements, knows the answers to these questions. At least, he knows answers so near the truth that wherever he may be, he may take up a bit of Theosophical work and execute it in a highly Theosophical manner.

It is work enchanted, turned into joy. It consists of teaching, of washing dishes, sweeping floors, balancing cash-books, grading roads, voting just bills, giving good counsel, rendering equitable decisions; you, in your place, with all your Karmic obligations holding you; and, in my house, I, each approaching the accomplishment of his particular duty.

It is Theosophical work to do these things so well that the task gives eloquent testimony of the creative soul at work.

Whoever, unselfishly and sincerely, is doing needed work with nicety and joy, is carrying out Katherine Tingley's plan for the ennobling of the race; for all who behold such work are lifted up to the place of the loving thoughts that made it, and go away challenged to greater endeavor and better performance.

Now, as all know, much work is done carelessly; and much work looks well done but is not really so, for the attention that should have made it wholly lovely was divided between diligence and the contemplation of price; and by price is meant not money alone, but getting another in one's debt, or getting praise and gratitude to flow back, and recognition of ability. One working for any of these ends is not doing Theosophical work. If he had worked unselfishly for a score of years and could then undertake a task sordidly, he would not be Theosophically engaged. His Theosophical usefulness would be utterly gone, for the time being.

The object of Theosophical work has never

been other than to raise the standards of life. Anyone who thinks the world and its life are good enough simply has not looked into (is darkness-blinded and cannot see) the fallen state of the man-god, himself; nor has he looked high enough towards the state of the god-man that he must reach.

Theosophy sees a colossal task ahead. Its Leaders call upon all to help to get it done.

FOR, in the words of a Sage, known only to a few Occultists:

The Present is the child of the Past; the Future, the begotten of the Present. And yet, O present moment! knowest thou not that thou hast no parent, nor canst thou have a child; that thou art ever begetting but thyself? Before thou hast even begun to say "I am the progeny of the departed moment, the child of the past" thou hast become that past itself. Before thou utterest the last syllable, behold! thou art no more the Present but verily that Future. Thus, are the Past, the Present, and the Future the Ever-living Trinity in One—the Mahâmâyâ of the Absolute "IS."

H. P. Blavatsky

No one can say *No*, for while he breathes he can strengthen the thought, the will, of the world with his beneficent thinking. No one but yourself has ever denied you the privilege of sharing in this work, and if you are not now actually lifting the burden of the ages, look, look, to your impediment. What, after all, *do you want?* To work in the interest of the ancient Cause of humanity, or just a bit more ease and praise for your own dear self? The joy of service that is not bound by desire, it is given to few to know. One day it will be the heritage of all. STUDENT

Our Schools---Discipline with Freedom

THE shortcomings of our public schools are being talked of everywhere; and it is well that this should be so, for it is a sign of healthy activity in the spirit of reform. It indicates that an influential section of the public is not content to let things remain as they are, but is aspiring to something better.

One also observes, with less satisfaction, that in some quarters ecclesiasticism has joined in the cry on its own account, exaggerating the evils of the school system, overlooking its good points, and putting in a plea for the ecclesiastical control of education.

But the public has had enough of ecclesiastical domination and can fight its own battles itself without seeking a remedy so desperate.

A writer in the *Atlantic Monthly* discusses this question, considering the respective tendencies of the two forces that combine to establish the public school system—the educational forces, and the public or political forces.

Four charges, he says, are brought against the schools. First, the pupil does not gain real knowledge. He studies about things in an indefinite sort of way but never learns the solid facts. The haze of indefiniteness pervades all; the old-fashioned drilling has vanished; pseudo-psychological "methods" are taught. The pupil is not trained in exactness and thoroughness.

Second, the pupil does not even learn to use his mind.

Third, the results are not practical; they unfit pupils for life.

Fourth, the moral traits are hardly awakened; the children are left unfitted to withstand the temptations of life.

In considering the conditions that have led to these results, the writer takes first the teacher. Superintendents have not been adequately trained for their post, which is one requiring a combination of the powers of a scholar, administrator, moral teacher, and sev-

eral other rôles. Instead, they have too frequently been elevated by interests, political, commercial, or cliquy. Later, however, he thinks, some young men have been devoting themselves to the study of scholastic administration and have given a propulsive force to education, for which we owe them gratitude. Not sufficient attention has been given to the training of teachers, it being assumed that anyone can be a teacher. "The inspiration of teaching must be personality, but how shall they inspire if they have no soul for their work?" Teachers are made in factories and the process of manufacture shrivels them into drudges. But, while the administration thus cramps the teachers, it is itself cramped by lack of public sympathy and support. But here again we are reminded that "money alone cannot create a profession."

Next is considered "What shall these teachers teach?" Formerly there was no doubt on the question; the three R's were taught; now we have added an icing to the cake, but very little of the nourishing substance is left.

This course of study, being built by educators who have studied books rather than civilization, is bookish. . . . The cry of an awakening nation is, "Back to the fundamentals. Make education practical." But it cannot define what constitutes a practical education.

The science of child-study has been made ridiculous in clumsy hands. There are homoeopathic pellets of anatomy and physiology, of painting and drawing, of psychology and philosophy—sugar-coated, for the theory is that the teacher must make things easy for the pupil. Beautiful textbooks and charts, with carefully prepared and analysed lessons, discourage all genuine effort. The child is made to believe that superficiality is a substitute for thoroughness; but when he is sent out into the world, he realizes that he has been lied to.

Space forbids to go into the description of the other conditions, such as the meddling interference of the public, and particularly of unreasonable parents, the various political and cliquy influences, the book companies and supply houses, etc. But the writer concludes that in spite of all these drawbacks, *our free schools have vindicated the great wisdom of their founders, that at heart everybody believes in them, and that they are among our most cherished possessions.* For remedies he suggests that they must be put under professional control, out of the reach of interfering influences; there must be a saner popular participation and a greater public interest; more tranquility for the pedagogue, more freedom and more enterprise. This concludes the abstract of the article.

Of course the proposal to put education under church influence is out of the question altogether; for that would be introducing in an aggravated form one of the principal evils of which the writer complains. The great boon of our educational system is its *freedom* from such influences; and so long as it maintains this freedom, it is a menace to the upholders of dogmatism, who will therefore naturally seize upon opportunities of exaggerating its defects. One must agree with the writer that the freedom of schools from interfering influences must be maintained.

But the schools have a difficult task before them—the reconciliation of freedom with dis-

cipline. It is comparatively easy for a narrow and strictly ruled sectarian institution to enforce discipline and method; but it is done at the expense of freedom and liberality of thought. On the other hand, freedom, the great American palladium, has often been maintained at the cost of discipline. America has now to learn how to have *both freedom and discipline at one and the same time.* The school system is only one among many of our institutions face to face with this problem.

The solution of this problem is, of course, that people should recognize the existence of moral laws and obligations binding upon everybody. They would then be bound only by these moral laws and by nothing else. But we

Lomaland Photo. and Engraving Dept.
SRA. WOODCOCK DE JANÉ
OF SANTIAGO DE CUBA

She stretcheth out her hand to the poor;
yea, she reacheth forth her hands to the needy.
Strength and honour are her clothing; and
she shall rejoice in time to come.

Ecclesiastes xxxi

cannot now revive the old ecclesiastical dispensation. The present age has virtually thrown over that and shows every sign of being about to rediscover the moral law for itself, as a fact in nature. Solidarity is no longer a pious rule preached by the churches, but a scientific principle, recognized as being an actual and essential condition of life, to ignore which is to court inevitable disaster. Thus a public conscience is being evolved, resting on grounds of knowledge instead of on dogmatic authority. It is this that must control the school system and be the basis of discipline and of freedom.

But the laws of life are little understood; and it is here that Theosophy comes to the rescue with its teachings which have been demonstrated to have such a practical value where all else has failed. If the teachers had the insight which Theosophy gives to its students, they would be able to grapple with the

real problems of education. They would be able to give to their pupils that thoroughness and exactitude, that grip and aptitude, the lack of which is so felt. And Theosophical parents would discern the true needs of their children. More knowledge, more wisdom, more understanding of life, is what the educational system needs. This will save it alike from chaos and from falling into the hands of interests, ecclesiastical, financial, or what not. The whole world of education is in a state of ferment, a period of transition, for the old ideals of school-training that have outlived their beneficence are rapidly dying and everywhere teachers are seeking higher ones to take their place. STUDENT

Jottings and Doings

(From a Student's Note Book)

THE following paragraph, which is curiously suggestive to the unprejudiced historic mind, is clipped from a well known West Coast daily:

BEATIFICATION IS COSTLY
MAKING JOAN OF ARC SAINT COSTS ALMOST
270,000 FRANCS

Rome, June 26.—The cost of making Joan of Arc a saint was between 260,000 to 270,000 francs, partly accounted for as follows:

Introductory ceremonies,	10,000 francs
Process <i>non cultu</i> ,	2,000 francs
Process <i>fama sanctitatis</i> ,	2,000 francs
Process <i>de validitate</i> ,	2,000 francs
Process to prove the virtues,	12,000 francs
Decree of the above,	1,000 francs
Final depositions,	9,000 francs
Process regarding miracles,	12,000 francs
Decree of the above,	1,000 francs
Congregation and decree <i>de tuto</i> ,	3,000 francs
Cost of the ceremonies of beatification	100,000 francs
Other incidental costs,	50,000 francs

To this must be added 150,000 francs (\$30,000) for the decoration of St. Peter's Church.

OUIDA points out that if women claim the privileges of men, they ought also to welcome the responsibilities; and asks whether women are to become soldiers, and sailors. People in general, whichever their sex, are apt to forget the responsibilities in clamoring for the privileges. But the most important point is that women have ready to hand such vastly greater opportunities of gaining influence than the franchise presents, and are overlooking these while demanding a privilege which by comparison is so small. If they have failed to use to greater advantage the enormous influence they already possess, of what use would it be for them to have other influence given to them? Would they use it any better? The mothers, sisters, wives, of voters aspire to vote with their own hands. But, to quote Ouida again, the great women of the world have always found means to make their influence felt, means vastly more potent for either good or ill. For the personal equation is the mighty power, after all.

ACCORDING to the census of marriage and divorce statistics taken by the Government during the last year, the number of applications for divorce filed throughout the United States in the twenty-year period from 1887 to 1906 will reach to the enormous total of 1,400,000. Chicago stands away down in the list, New York, Boston and Philadelphia passing it both in the number of divorces granted per 100,000 of population, and in the ratio of increase, which ratio is shockingly high.

OUR YOUNG FOLK

Alfred, Lord Tennyson

THE poet Tennyson's life began on August 6, a hundred years ago, at the rectory of Somersby in Lincolnshire, England. His father, the rector, was a stern, scholarly man, who sometimes had melancholy moods. He wrote verses, and two of Alfred's brothers, Frederick, and Charles, were poets also. It was to their mother that the boys read their first attempts at poetry. They owed much to her tenderness and affection, and when she was in her chair, being drawn along by a large dog, they used to walk beside her and read their verses to her.

Alfred was only eight when he wrote a poem in blank verse in praise of flowers, and at twelve he composed an epic of 6000 lines, in imitation of Scott. From his earliest years he looked forward to being a poet. He believed this to be the noblest vocation and he strove by a life of purity and dignity to be worthy of it.

The Tennyson family was a large one, and the brothers and sisters had very enjoyable times together in the quaint old rectory and garden. As children, they liked to play "tournament." Another game they liked was writing stories to be placed under the dishes on the dinner table to be read aloud when the meal was over. Alfred's were always the best. He could tell stories as well as write them, and on winter evenings was often found by the fireside with the others around him listening intently to tales of adventure or of the weird doings of witches and dragons. Alfred, like most of the Tennysons, had great physical strength, and he conserved it by regular gymnastic exercise. When he grew up he was so big and strong that one day he picked up the pet pony and carried it, much to the delight of his younger brothers and sisters. All the members of the family were fond of animals. The father liked to study their habits, and the mother was known far and wide for her protecting kindness to them. Of course they had many pets, among them an owl and a monkey.

The boys were instructed by their father in the languages and mathematics and some branches of science. Alfred's first experience at school was not a happy one; but when, in 1828, he went to Cambridge University, he found himself one of a congenial group of students, all talented, enthusiastic, and fond of poetry. Many of them became famous, and several remained friends of Tennyson's to the end of his life. They had a debating society and discussed many topics such as the possibility of educating humanity and ushering in a new age of peace and progress. Tennyson won a prize at Cambridge for a poem, *Timbuctoo*. He had to leave without taking a degree, and go home to help his mother to take charge of the family, his father having died.

Two years afterwards, in 1833, occurred the event that brought the young poet face to face with the problems of life and destiny.

Lomaland Photo. and Engraving Dept.

ALFRED, LORD TENNYSON

This was the death of Arthur Hallam, the one among his Cambridge companions whom he loved most dearly and who was most sympathetic and congenial. Tennyson had some of the melancholy of his father in his nature and this sorrow at first almost crushed him, but he mastered his grief, and out of the thoughts about life and death which came to him in his sorrow, he built a beautiful monument to his friend, in the poem *In Memoriam*. It was not published until 1850, the year when Tennyson was married to a lady who was an ideal companion for a poet. So unselfish and high-minded, so helpful to him in his work was she, that some of their friends thought her as great as her husband.

From 1850 to 1892, when he died, Tennyson lived very quietly in the country, devoting all his energies to the production of poetry. He traveled occasionally, on the Continent, and also visited Wales and Ireland. The beautiful *Bugle Song* was written after hearing the sound of a bugle at Killarney Lakes. Many visitors found their way to his home, and the list of his friends includes almost all the great names of the time. Much, however, as he depended upon friendship, it was with books and with Nature that he most communed. How he loved the sea and the stars! And surely he had remarkably keen ears for Nature's music, for the songs of breeze and brook have crept into his poetry and thrill us when we read, as once they thrilled the poet.

It was from books and his own love of poets and their craft that Tennyson learned to range so wide for the subjects of his poems and to use so many kinds of metre. A volume

of his poems is good company. There you can find old Celtic and Saxon tales, like *The Voyage of Maeldune* and *The Battle of Brunanburh*; themes from old Greece and Rome, like *Demeter* and *Lucretius*; stirring ballads and patriotic songs like *The Revenge* and *The Charge of the Light Brigade*; lyrics whose music haunts your ear, lovely songs like *Sweet and Low* and *The Brook* and *Break, Break, Break*; exquisite passages of blank verse as in *Morte D'Arthur*; besides many other poems which are of great interest because they voice the spirit of the nineteenth century.

The nineteenth century was a time when people had to begin to change their ideas. Students of science had discovered a great deal about the development of the physical bodies of men and animals, and about the earth itself. They said it was impossible to believe the story of the creation that had long been accepted as true. A great many people became confused. They said, "If man and the earth were not created by God in the way we thought, what is God? What is man?" Some began to despair, thinking that the body might be all. Tennyson, though he lived a secluded life, kept in touch with what men were thinking. He was not a great Teacher; but he had the poet's insight; and he helped the people by writing beautiful poems in which he brought forward ideas that were in harmony with the discoveries of science and still recognized the Soul. He wrote of the human soul striving towards a great end and triumphing over the desires of the body. He did not explain it; it would have taken Theosophy to do that and he did not know about Theosophy; but he was strong in his own faith that there is a high destiny for humanity and he voiced this in his poetry. Sometimes it seems as if he had a glimpse of the great teaching of rebirth, as when he writes:

Moreover something is or seems,
That touches me with mystic gleams,
Like glimpses of forgotten dreams.
Of something felt, like something here,
Or something done, I know not where,
Such as no language can declare.

He expresses thus the higher and lower natures:

If my body come from the brutes, tho' somewhat
finer than their own,
I am heir and this my kingdom. Shall the royal
voice be mute?
No, but if the rebel subject seek to drag me from
the throne,
Hold the scepter, Human Soul, and rule thy province
of the brute.

In one of his earlier poems he writes, to a world full of doubt:

God is law, say the wise; O Soul, and let us rejoice
for this poet, who loved beauty and also loved wisdom, found an echo of Truth in his own heart and not only voiced the spirit of his day but sang of the "divine event," the reign of spirituality, brotherhood and peace. STUDENT

THE CHILDREN'S HOUR

MINNIE AND WINNIE

MINNIE and Winnie
Slept in a shell.
Sleep, little ladies!
And they slept well.

Pink was the shell within,
Silver without;
Sounds of the great sea
Wandered about.

Sleep little ladies!
Wake not soon!
Echo on echo
Dies to the moon.

Two big stars
Peep'd into the shell.
'What are they dreaming of?
Who can tell!'

Started a green linnet
Out of the croft;
Wake, little ladies,
The sun is aloft!

Tennyson

Salmon

OF all the fish that swim the waters of the earth, none is more worthy of our study than the salmon. Like the silk-worm, the salmon goes through several changes before it becomes full grown, ready to sport in the briny deeps, as gaily as the butterfly flits in the balmy summer air.

Salmon choose mates, just as birds do, and, like the birds, they seek out a safe place to build their nests. When a pair of salmon have found a suitable sheltered nook, they set to work together to dig in the sand a nest eight or nine inches deep. When it is finished the mother salmon lays the eggs in it, and the father salmon covers them over with sand to protect them. Then they swim back to the sea, for they know that the warm sun of spring will hatch out the eggs without further care. Salmon always choose their nesting-place up a river, although they themselves love the deep ocean best. They know that baby salmon cannot live in strong salt water.

At first these baby salmon are very weak and helpless, and look like anything rather than the strong, gallant creatures they will someday be. So they hide about among the rocks where they first hatched out. Fifty days pass before they even begin to look like fish. Gradually they take on their proper shape, and with it, coats striped with transverse bars. In this second stage they are known as parr, but even yet they are timid and weak and dare not follow their brave parents to the sea. They remain nearly two years in the quiet river pools, and only gradually take on new strength. With it they get a shining jacket of silvery scales. When they appear in this new raiment they are known as smolt, and then their courage comes. Whole troops of smolt betake themselves, as swiftly as fins and tails will bear them, to the longed-for sea.

In the sea the smolt lose themselves mysteriously for several months, then they return again to their native rivers and seek the pools, where they timidly frisked about as parr. But

Lomaland Photo. and Engraving Dept.

A SHEPHERD AND HIS FLOCK, THE LANDES, FRANCE

what a transformation has taken place! The little smolt that was only a few inches long, weighing hardly an ounce, now is a vigorous grilse, and his weight is nearly four pounds. After a short stay among his native haunts, back the grilse goes to the sea. When he next seeks the river, he is a full-grown salmon weighing from six to twelve pounds. With each return to the sea, his size and weight increase until even sixty pounds is reached.

When the salmon go up the rivers to seek their spawning-places, they let no obstacle stay them, not even a water-fall as high as twenty feet. There is such a one at Leixlip near Dublin, Ireland, and the country people make a holiday in order to see the salmon clear this great height by their wonderful leap, as they seek the upland waters.

For the salmon are really remarkable athletes, and display skill, strength and determination in making their high leaps. When a salmon, in swimming up a stream, meets a waterfall, he bends his flexible backbone until his head nearly touches his tail, making of his strong, slender body a kind of circular elastic spring. Then he suddenly lets himself go. His powerful tail strikes the water, and with the force of the blow he shoots upward, like the arrow from a bow, and clears his distance. If he fails, he tries again and again until he succeeds. Sometimes the courage and determination of a leader salmon, in trying again and again to make a difficult leap in which he finally succeeds, will encourage his followers, and they will try and try, until at length they too clear the height.

Like the bee, the ant, and the silk-worm, the salmon is celebrated in the myths, folk-lore, and poetry of nearly all people, from the most ancient times, and is still loved today. The salmon is one of Nature's teachers.

UNCLE OSWALD

We Conquer Step by Step

WHAT are you doing, Miriam?" her mother asked, as Miriam with pencil and paper was busily writing.

"I am putting down my faults, Mama," answered her little daughter. "In each of

these little spaces, I am going to write a fault, and every time it gets in my way I am going to put a mark after it."

"Of what use will that be?" asked her mother.

"So that I can look at them, Mama," replied Miriam.

"But Miriam, don't you think that if you think of your faults so much, they will grow bigger?" asked her mother. "You know how soon a tiny thing will grow when we think constantly about it, and how enlarged it becomes; in fact it occupies all of our thoughts, so that we cannot think of anything else."

"Well!" said Miriam, "I am going to look at them only at night and in the morning. At night I shall look at the whole day and put a mark after the faults which have shown out in my actions during the day. In the morning I shall look at it again and see the faults which hindered me on the day before, and then I shall try not to have the same faults appear in the new day. It will be just like a school and I shall be the teacher and my pupils will be my own faults; and I am going to work and work to make my school smaller."

"What made you think of this way of conquering your faults, Miriam?"

"Why, all the girls were discussing it, when we were talking about getting rid of our most troublesome faults. Then we agreed to try it together and we have taken for our motto 'We conquer step by step.'"

E. W.

Fairy Ropes

HAVE you ever watched the glistening threads the spider spins from bush to bush in the garden? When the dew is on them they shine like diamond ropes. And sometimes they are so long, even long enough to cross a path four feet wide. How do you think they are placed there? Does the spider leap across taking the tiny rope with him? or does he throw the rope first and then use it as a tight-rope to cross on? A great naturalist, Charles Darwin, writes of the spiders sending out these threads and then floating away on them. The gossamer spider seems to have the power to sail the air. R.

The above three comprised in a pamphlet of 50 pages, published by the Woman's Theosophical Propaganda League, Point Loma15

HYPNOTISM: Hypnotism, by W. Q. Judge (Reprint from *The Path*, vol. viii, p. 335) — Why Does Katherine Tingley Oppose Hypnotism? by a Student (Reprint from *NEW CENTURY PATH*, Oct. 28, 1906) — Evils of Hypnotism, by Lydia Ross, M. D. Isis UNVEILED, by H. P. Blavatsky. 2 vols, royal 8vo, about 1500 pages; cloth; with portrait of the author. *Point Loma Edition*, with a preface. Postpaid 7.00

KEY TO THEOSOPHY, THE, by H. P. Blavatsky. *Point Loma Edition*, with Glossary and exhaustive Index. Portraits of H. P. Blavatsky and W. Q. Judge. 8vo, cloth, 400 pages. Postpaid 2.25

LIFE AT POINT LOMA, THE: Some Notes by Katherine Tingley. (Reprinted from the *Los Angeles Saturday Post*, December, 1902)15

LIGHT ON THE PATH (M. C.), with Comments, and a short chapter on Karma. Authoritative rules for treading the path of a higher life. *Point Loma Edition*, pocket size edition of this classic. Embossed paper, .25; leather75

MYSTERIES OF THE HEART DOCTRINE, THE. Prepared by Katherine Tingley and her pupils. Square 8vo. Paper, 1.00; cloth 2.00

A SERIES OF 8 PAMPHLETS, comprising the Different Articles in above, paper, each25

NIGHTMARE TALES (H. P. Blavatsky). Illustrated by R. Macchell. A collection of the weirdest tales ever written down. Paper, .35; cloth60

SECRET DOCTRINE, THE. The Synthesis of Science, Religion, and Philosophy, by H. P. Blavatsky. *Point Loma Edition*; with Index. Two vols., royal 8vo, about 1500 pages; cloth. Postage prepaid 10.00

To be reprinted from the original edition of 1888, as issued by H. P. Blavatsky

SOME OF THE ERRORS OF CHRISTIAN SCIENCE. Criticism by H. P. Blavatsky and W. Q. Judge

VOICE OF THE SILENCE, THE. (For the daily use of disciples.) Translated and annotated by H. P. Blavatsky. Pocket size, leather75

YOGA APHORISMS (translated by W. Q. Judge), pocket size, leather75

GREEK SYMPOSIA, as performed by students of the Isis League of Music and Drama, under direction of Katherine Tingley. (Fully protected by copyright.)

1—THE WISDOM OF HYPATIA; 2—A PROMISE. Each15

NEW CENTURY SERIES. THE PITH AND MARROW OF SOME SACRED WRITINGS.

Ten Pamphlets, issued serially; Scripts, each25

Subscription 1.50

Already published:

SCRIPT 1—Contents: The Relation of Universal Brotherhood to Christianity—No Man can Serve Two Masters—In this Place is a Greater Thing

SCRIPT 2—Contents: A Vision of Judgment—The Great Victory—Co-Heirs with Christ—The "Woes" of the Prophets—Fragment: from Bhagavad Gita—Jesus the Man

SCRIPT 3—Contents: Lesson of Israel's History—Man's Divinity and Perfection—The Man Born Blind—The Everlasting Covenant—Burden of the Lord

SCRIPT 4—Contents: Reincarnation in the Bible—The Money-Changers in the Temple—The Mysteries of the Kingdom of Heaven—The Heart Doctrine—The Temple of God

SCRIPT 5—Contents: Egypt and Prehistoric America—Theoretical and Practical Theosophy—Death, One of the Crowning Victories of Human Life—Reliance on the Law—Led by the Spirit of God

SCRIPT 6—Contents: Education Through Illusion to Truth—Astronomy in the Light of Ancient Wisdom—Occultism and Magic—Resurrection

SCRIPT 7—Contents: Theosophy and Islam, a word concerning Sufism—Archaeology in the Light of Theosophy—Man, a Spiritual Builder

SCRIPT 8—Contents: The Sun of Righteousness—Cant about the Classics

SCRIPT 9—Contents: Traces of the Wisdom-Religion in Zoroastrianism, Mithraism, and their modern representative, Paracelsism

SCRIPT 10—Contents: The Religions of China

SCRIPT 11—(Supplementary Number)—Druidism25

OCCULTISM, STUDIES IN (H. P. Blavatsky). Pocket size, 6 vols., cl., per set

THE MYSTERIES OF THE HEART DOCTRINE

PREPARED BY
KATHERINE TINGLEY
AND HER PUPILS

The Theosophical Book *of the* Twentieth Century

Tells the story and the history of the Theosophical Movement.

The prices are \$2 in cloth and \$1 in paper, which barely cover the cost, for it is printed and bound, not gaudily, but with such carefulness and thoroughness of art and craft as to make it unique among modern edition books.

ORDER FROM THE
THEOSOPHICAL PUBLISHING CO., POINT LOMA, CAL.

Isis Conservatory of Music OF THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY POINT LOMA, CALIFORNIA

Personal applications and inquiries received every Saturday
by the Secretary at SAN DIEGO BRANCH
ISIS HALL, 1120 FIFTH STREET

between the hours of 9 A. M. and 4 P. M. Full particu-
lars will be sent by mail upon application to

J. H. FUSSELL, SECRETARY AND TREASURER,
ISIS CONSERVATORY OF MUSIC, Point Loma, California

SOME OF THE ERRORS OF CHRISTIAN SCIENCE CRITICISM

BY H. P. BLAVATSKY AND WILLIAM Q. JUDGE

CONTENTS

"The Empty Vessel Makes the Greatest Sound"
A Note of Warning

—by H. P. Blavatsky

Of "Metaphysical Healing"

Affirmations and Denials

The Cure of Diseases

Replanting Diseases for Future Use

—by William Q. Judge

A MOST VALUABLE PAMPHLET. Outside of Theosophy there is given no adequate explanation of the healing that is at times accomplished, nor of its *rationale*, nor of the ultimate price that must be paid and the dangers connected with such practices.

This pamphlet is invaluable to all students.

Chemical Actions that Imitate Life

IT has often been remarked that the apparent simplicity of certain phenomena in science is due merely to the smallness of our knowledge concerning them, and that closer investigation shows them to be in reality very complex. And, as discovery advances, we will find more and more that in many cases our former simple explanations and easy generalizations will no longer suffice. The atomic theory was such a simple explanation; but later investigations have shown us that this generalization was too simple and we find new complexities revealed beneath the apparently serene surface. The simple structure assigned to gases, too, represents rather the limitation of our knowledge concerning them than the actual facts; and, like the clean areas that represent unexplored countries on a map, their seeming innocence but cloaks a hidden mine of mysteries to be fathomed.

The phenomena connected with the solution of solids in liquids are a case in point. In books of physics and chemistry we will find very simple descriptions of solution; and truly, the less we study the matter, the simpler it seems. But the converse holds good to quite a remarkable degree. Solution is not the mere disintegrating of the particles of the solid and the distribution of the same among the particles of the fluid. There are also thermal phenomena associated with the process. Again, it cannot be definitely decided to what extent solution is a form of chemical combination and to what extent it is a physical process. Solution plays a paramount part in chemical interactions, the great bulk of which depend on the condition that one or more of the ingredients shall be in a state of solution. And when we pass from the simpler salts to the more complex substances, the phenomena become still more intricate.

An article in *Knowledge and Scientific News* (London), for June, gives some remarks and descriptions of experiments in this connexion, the purpose of which is to show the striking analogy between certain effects produced in the chemical beaker by osmosis, and certain effects that are seen in the cell of living matter. One experiment is as follows:

A drop of sugar solution containing a trace of potassium ferrocyanide is introduced into a dilute copper sulphate solution. Of course there is a precipitate of copper ferrocyanide; but this precipitate forms first around the surface of the drop of sugar solution, where it

forms a thin membrane enclosing the drop and shutting off further precipitation. Now this membrane begins to act osmotically; and, like any other osmotic membrane, it allows the watery solution to permeate it more quickly than the sugary solution. The consequence is that more liquid passes into the drop from outside than passes out from the inside. Hence the drop swells, thus resembling a cell which is growing. When it has swelled to a certain size, the growing thinness of the membrane causes it to break at a point, and at this point the sugar solution exudes, but is of course immediately coated with a fresh deposition of copper ferrocyanide. Thus our cell acquires a bud. This bud in its turn grows and eventually acquires another bud; the new bud grows and develops another bud; and so on, until we have a row of buds, resembling a row of cells, which finally form themselves into a line and form a hollow tube. At times a portion of the sugar solution will become detached and float away, when in its turn it will go through the same processes on its own account; and thus we have the phenomena of reproduction imitated. So our solutions give us cells which grow, bud, reproduce themselves, and nourish themselves from the surrounding medium.

The following experiment is also described:

On a glass plate are poured out five cubic centimeters of a 10 per cent gelatine solution to which has been added a drop of a saturated solution of different composition (preferably ammonium chloride, bromide, or iodide). On the gelatine thus prepared are arranged symmetrically some drops of various solutions, such as calcium nitrate, silver nitrate, potassium citrate. If this plate be allowed to rest on a horizontal surface the liquid drops are seen to diffuse gradually, generating the most surprising effects of form and color.

Here again the important point about these forms is their analogy to the structures of living tissue.

Thus has been established between the so-called inorganic and organic kingdoms an analogy which can hardly be regarded as without any significance. By some it will be seized upon as ground for the assertion that vital phenomena are after all merely physical and chemical; by which assertion they will persuade themselves, and try to persuade others, that the explanation of vital phenomena has been simplified. But for those who think that the physical and chemical phenomena themselves stand in as great need of explanation as anything else, the significance will be different. Considering that forces and affini-

The Phenomena of Growth

Life is Infinitely Variable

Chemical Magic

Conscious Life-Forces behind all Action

ties are mere names signifying unknown causes, the simplification achieved by reducing vital phenomena to these terms does not amount to much in the way of explanation.

Suppose we grant that the phenomena of the living cell are *nothing but osmosis* after all. Very good; but what then is this osmosis? We take a jelly bag full of syrup and hang it up in a basin of water. The syrup oozes out very slowly, and the water oozes in very fast; and so the bag swells. This is osmosis.

But what makes the various things behave in this way? The answer will come, "attraction, perpetual motion among the particles of the liquids." But how much have we explained when we say attraction and motion? Both of these are effects, and of the particles we know nothing. If we rest content to accept motion and attraction as unexplainable ultimate axioms, well and good; but then we have created a couple of Gods and might just as well postulate the "Almighty Finger" at once.

The truth is that the same unknown causes are required to explain physical phenomena as are required to explain vital phenomena; and these causes are not so unknown after all, for they are the same as those which operate in our own organisms—namely mind and will. Forces and properties, operating in the field of physical nature, are the result of mind and will operating in the realm of consciousness.

And it is surely a mistake to regard the physical and the vitalistic explanations as alternatives, and to say that either one or the other rules, or that one rules in one kingdom and the other in another. There are physical phenomena everywhere; but

Life is Real—
Phenomena
Evanescent

they are not different from those other phenomena which we call vital, except in degree. Both the vital phenomena, which we call (whether rightly or wrongly) more complex, and the physical phenomena (which we consider simpler) are equally the effects of hidden causes. There is only one rational explanation of natural phenomena, whether those of the test-tube or of the organism; they are the manifestations of the *universal life*, which is the synthesis of *mind* and *will*. And mind and will are the attributes of beings. Biology is already coming to the view that the animal body is made up of minute bugs. Chemistry will as surely come to the view that matter is made up of minute bugs. All discoveries point this way. The living being is the real unit in nature; the atom is a mere abstraction. But physical science can study only the effects; to study the nature of this cosmic life and its component creatures we must expand science so that it will embrace the study of such things as mind and self-consciousness. Thus this road, too, leads back to the main road of Self-Knowledge.

STUDENT

Science Opening up New Worlds

IF it had been predicted a generation ago that in this century a woman would discover in the earth's crust a new element that would exercise a magic influence over the minds of scientific men and cause them to recognize ancient wisdom—no one would have believed it. Yet now we have one eminent man

of science admitting that the elixir and philosopher's stone, and even perhaps the stories in *Genesis* (?), may be true, and that great wise races have probably existed on the earth, in remote antiquity, and have known secrets of nature which we have not yet discovered. And all this under the inspiration of the radiant exhaustless radium, discovered by Madame Curie.

What a change is this from the complacent, know-everything attitude of the science of last century. It shows that every now and then, in the course of our progress, we reach bumping-stages, as it were, where we halt to take breath before starting on again. Last century we said, "A, B, C"; this century we are saying "D, E, F." The sublime old truth that 2 and 2 make 4 is entirely thrown into the shade by the new discovery that 2 and 3 make 5. The atom was such a halting-stage for physics and chemistry; but now we have gone beyond the atom. The atom is now shown to be something that is always changing. It changes so slowly that we did not know it changed at all; but this Polish woman digs out for us an atom that changes so rapidly that we can watch it changing; and we know that all atoms change, some faster, some slower. We find that elements can be arranged in a genealogical series, according to the order of succession by which one gives birth to another. We find uranium dying and giving birth to radium.

The amount of stored up energy in the solid matter of the globe has been found to be so enormous that the greatest energies with which we have been familiar are like the airy sprays on the surface of the ocean compared with the titanic energies of its depths. By merely disintegrating molecules into atoms we can get enough energy to boil our pot or turn our sewing machine; but the ancients, says our scientist, may have disintegrated the atom, thereby getting enough energy to — to do what they may have done.

The progress of discovery confirms the ancient teachings. When, last century, H. P. Blavatsky wrote her books to assert and demonstrate this, she was laughed at; but her prophecies are being rapidly fulfilled, and they are on record. Both in religious and scientific circles representative men are turning complete somersaults (figuratively speaking), and admitting the very things which their ilk denied so strenuously in face of H. P. Blavatsky's assertions. Last century, too, a man of the name of John Worrell Keely of Philadelphia, discovered how to utilize the tremendous energies latent in the atom; but he met a martyr's fate; he was a little before his time.

Speaking of Keely's case reminds one that another important principle was demonstrated (incidentally) by him. Other people could not work his machines; he alone could evoke the forces he used. We are approaching an epoch in science when the attributes of the operator will play a significant part in the success of the experiment.

It is something to have reached a stage from which we can see the vast vistas of the unexplored before us and how little is what we know compared with what we do not know. But it is more the result of a changed attitude of mind than of any new discovery; for these vistas of the unknown have been open

before us all the time. Everywhere the little oasis of knowledge fringes upon the great desert beyond. Physical science shows us things moving about; how can it show us anything more? From the very nature of its method of observation, it can go no farther. To find out the cause of motion and life we have to dismiss from the imagination all ideas of matter and space such as are derived from the impressions of our physical senses, and to search within the realms of mind and consciousness.

More about the "Fourth Dimension"

THE prize essay on this subject which appeared in the *Scientific American* and was noticed in the CENTURY PATH, number 39 of this volume, has been followed in a later issue of the *Scientific American* by another essay, which received first honorable mention.

This writer is clear-headed and evidently accustomed to reasoning. He indicates the fallacies and confusion of thought committed by the fourth-dimensionists, some of which were pointed out in our previous note. He shows that as mathematical lines and plane figures do not occupy space, they cannot be used as data for the analogical reasoning employed. Lines and plane figures do not obstruct one another, and can intersect or coincide; hence, if the supposititious two-dimensional beings find any obstruction to their movements, it must be because they have physical volume and are three-dimensional.

He shows the false analogy by which it is argued that if lines end in points, planes in lines, and solids in planes, therefore four-dimensional figures will be bounded by solids. For some lines occupy two dimensions, yet they still end in points; and some planes are bounded by lines occupying two dimensions; while many three-dimensional bodies are bounded by three dimensional surfaces. So that there is no such scale or series as that imagined.

The absurdity of imagining that a body would disappear on "entering the fourth dimension" is pointed out; for the body would continue to occupy the three familiar dimensions—and the fourth too. Also the idea that by means of the "fourth dimension" the contents could be drawn out of an egg without breaking the shell. For, whatever may be possible in a conjectured four-dimensional space, it has nothing to do with the egg, which is in three-dimensional space. In short, four-dimensional space, supposing it to exist, has nothing whatever to do with the actual universe in which our sensations and perceptions are exercised, but is, as the writer of the prize essay is doubtless fully aware, a quasi-algebraical concept.

To Keep off Mosquitoes

THE Department of Agriculture has commissioned an investigator to find out what is the best way of driving away this pest from camps, etc., etc.; and the result has been a recipe which will make one welcome the mosquito as an excuse for trying it. Take one ounce of oil of cedar, two ounces of oil of citronella, and two ounces of spirits of camphor; sprinkle a few drops of the mixture on a towel thrown over the head of the bunk. T.

Some Views on XXth Century Problems

"A Certain Attitude"

DURING a phase of balloon enthusiasm in England, now many years ago, a society was formed to deal exhaustively and continuously with theory and practice.

But after a while the enthusiasm lapsed and balloons vanished from the public mind. No new data forthcoming, they also vanished from the mind of the society. But as it decided to continue existing, its meetings occupied themselves with many and almost all other subjects. Special and specialist information concerning balloons was no longer to be had from consultation of its papers. As there were other societies which specialized on the various subjects which this society discussed, it seemed to have no *raison d'être*.

The Churches seem to be in somewhat the same case. Some of their own mouthpieces, whilst admitting that they may no longer offer a unique and miraculously inspired body of teaching, claim that they still have a certain special attitude, and that they could by means of that attitude throw a special illumination upon social problems. It is these which concern the lives of the great masses, and it is the great masses which the Churches are not reaching. "In this present disquiet of the church," says Mr. Robbins in the *Atlantic Monthly*,

the object of chief concern is the seemingly elusive workingman. . . . Many have been the attempts to seek and find him. The institutional church was one of the earliest, and it is not by any means an abandoned experiment. Yet the suspicion has been growing, after several years of experience, that, after all, the gymnasium and the shower-bath, the trades-school, the boys' club, the sewing and cooking classes, the kindergarten, the game-room, the circulating library, and the provident fund, may not be striking to the heart of this very tremendous and very terrifying Labor World.

Hence the present propositions: that the Churches should bring their "attitude" into that World, that is, mix themselves up with the various questions, projects, movements and organizations with which that World is occupied. The balloon society shall cease to discuss balloons (about which it *knows* no more than anybody else), and, whilst preserving a balloonish sort of "attitude," consider molecules and poetry and fertilizers. In this way it will introduce sweet harmony among the chemists and critics and agriculturists.

This is the day of specialization. Evolution consists in specialization of function. Every organ in the body politic must show that it can do some special thing better than any other organ and thus make a *unique* contribution to the general sum of work, or—decay. If the church finds that it is not holding its own it should consider whether there is now any special matter with which it can uniquely occupy itself, a matter for knowledge upon which people will look to it as they look to a chemist for knowledge about the atom—a matter not dealt with elsewhere. For they are looking to it now somewhat questioningly, the question being, What have you to say from your department comparable in extent, certainty and value to that which the chemist contributes from his department? *Have you*

a department at all? Are your men progressing individually in the knowledge of their chosen field?

Surely the field is rich enough! The spiritual world, life on its subjective side, the inner self of man and its powers and modes and relations to the inner self of the universe, the purport of existence!

"But these things, in the wisdom of God, are hidden from us, not to be known."

Well, if that be so, what is the church's *raison d'être*? The philosophic system builders can *think*, very finely some of them; we want a school of men who have followed the path that brings *knowledge*.

If the balloon society does not produce men who have unique knowledge about balloons, its balloonish "attitude" with respect to fertilizers will not be admitted to be of the slightest value to the science of agriculture.

STUDENT

Evoking the Archæus

FAITH-healers, mind-healers and the like, who regard their cures as evidencing the truth of their philosophies, should consider what a number of entirely irreconcilable philosophies must in that case be true. Such recoveries, sudden, apparently complete, from hopeless maladies and from the results of accidents of all kinds, abound in some period of the history of every religion. They are said to be going on now at Lourdes and at consecrated shrines of every faith. They occur at the hands of religious enthusiasts. Mere excitement has produced them and they may result from hysteria. The literature of spiritualism is full of them. Christian Science has them and they may follow the Medicine dance of the Red Indian. They are variously regarded as due to the power of God or of the Virgin, of Jesus Christ, of "Immortal Mind," of the Subconscious, of Spirits, of the Holy Ghost, of the "Od" of the operator, and so forth.

We might seriously consider one of the philosophies as evidenced by them—at any rate some sort of case for it would have begun to be made out—if they occurred only among the adherents of that one. But their universality compels us to begin from another point altogether.

They prove, first, that there is a power capable of doing wonderful things on the body, restoring it from almost any degree of disease or acquired deformity. Second, that it is readily called into action by a sufficient degree of that form of convinced expectancy commonly called faith, the action being outside or beneath the field of consciousness. This is about as much as we can get from them.

But we can contribute from other quarters. We know that a good way up the animal kingdom the power of reproducing a lost limb remains perfect. We know that in ourselves that power did at any rate produce the limbs we have; and though it will not do so twice it will go a good way in the repair of injuries. Do not the miraculous cures suggest merely that this power resumes the activity it exhibited during the pre-natal and infantile periods

of life and which it exhibits additionally in most of the lower orders of the animal tree? Its work is always wholly below the level of consciousness, but it does not therefore follow that consciousness can have no guidance of it. Some congenital marks, "mother's marks," are the result of the imagination of the mother at work upon it. It is evident that a sufficient degree of convinced expectancy, however unformulated, calls it into action. Even the convinced expectancy of waking tomorrow morning at a given moment causes at that moment a change in its workings which suffices to wake us. The will to live, inspired by love, sometimes sustains a mother's life long after the period when disease would have otherwise destroyed it.

When man has learned to live rightly and not to waste this natural energy in sensuality, it will habitually do for him what it now does in states of consciousness that are mostly morbid, induced by morbid forms of belief, and often productive of irreparable damage to the finer workings of the mind and soul, wholly unsuspected as that damage may be. STUDENT

Foliage for Flowers

AT a recent literary dinner in London, attended by most of the chief English men of literature, it was generally agreed that our age is not one of supreme literary production. It is the day of science. No new great writer of the first rank is anywhere showing himself. The "Victorians" are all gone.

What is the matter with the creative spirit? Has it gone to another planet, or is it just taking a breath between two great efforts?

When a plant finds conditions very unfavorable it will sometimes take to making leaves and stalk instead of flowers. That is easier, and the leaves are perhaps of extra size and beauty. But they are not flowers.

When the vitality of a nation is at its height it runs over easily into creative work. Great literature, prose and poetry, appears. This is the flower of mental vitality. But if there is not enough for that, there will be lower forms of mental work and production, often very fine of their kind. Literature becomes imitative; criticism, demanding less vitality than production, often flourishes exuberantly and may be very perfect in its literary grace and style. And science, demanding least imagination, though grateful for any amount legitimately expended upon her, may go ahead with striking rapidity.

Is not this our case? The registrars, from the consideration of tuberculosis only, can tell us that our *physical* vitality is low. And the absence of the men of great literature can tell us that our *spiritual* vitality is no better. The former is absorbed by our ways of life, our excesses, indulgences, mistakes; by the necessities of great poverty and by the habits of great wealth. The latter is absorbed by international tension and enmity, and within each nation by the tension and enmity of classes. There will be no great literature, save perhaps a sporadic example here and there, until we have learned the lesson of the ages. STUDENT

The Sources of Ancient Etruscan Civilization

ROCK-CUT TOMB DOORS NEAR CHIUSI
(Still working on their ancient stone pivots)

LEAVING now the monuments of remotest ages, of the times of Saturn and the Titans, considered in the preceding article, let us return to Caere. Here, on a height to the north, we find laid out a veritable city, streets, even an open plaza, lined by the façades of low cliffs, in whose surfaced fronts are doors as of human residences. Within these lead to true Etruscan houses, cut out of the solid rock. Scarce Egypt can show the parallel of these rock-hewn tombs that cover all Etruria. One at Caere, taken as a sample, is here illustrated. We see a passage, leading down a flight of steps, past two anterooms, to the atrium, beyond which are three inner triclinia. Around the sides are hewn and ornamented couches, some with carved stone cushions. On these are often found reclining portrait figures, in the attitudes of life. In one such tomb an arm-chair, cut from the living rock, stands as for a visitor at the head of the couch. Two such chairs, of the curule form, are found in the tomb whose ground-plan is here shown, standing in the place of honor, facing the entrance, and with trophy shields cut in the rock above, and giving to this tomb its usual appellation, as that of the Chairs and Shields. (See also the sketch in the next column.) Through the walls of the atrium (supposed of course to be open to the sky) are cut windows, both to the antechambers and to the triclinia. On the walls of these various house-like tombs are painted festive or heroic scenes, and within were placed in profusion the implements of daily life: vases, candelabra, ornaments and useful articles of every kind. To the Etruscan, death was not a break in life — only a doorway to another room. Space forbids further details; but this care for the spirits of the ancestors is the most striking characteristic of Etruscan life we have had preserved.

We may now gather in the main points bearing on our question.

History probably records no greater workers in metals than were the Etruscans. The exquisite grace and beauty of the many pieces that have come down to us, in their tombs, is beyond all praise; as witness the bronze ewer and candlestick of our sketches. An especially interesting bit is the touch of daily homelike life so frequent in their work, as in the cat chasing a bird up the standard of the candlestick, and innumerable other like conceits which are everywhere found. Nor was this art of metals confined alone to dainty ornaments, household articles, and jewelry, but great figures of cast and chiseled bronze attested their skill, as the quadriga

of the temple of Jupiter Capitolinus, or the statue of Apollo on the Palatine, fifty feet in height; or their statues which filled the temples of Italy and were even exported to other lands. Varro speaks of *Tuscania omnia in aedibus*, and according to another author, in Volsinii alone were 2000 statues. Health was secured to their cities by drainage systems whose traces remain today. They diverted rivers, and drained lakes by tunnels through the mountains, some of which great works are still in our day doing their original work. Some of their pre-Roman roads are still in use, as (according to Micali) that from Caere to Veii, and thence to Capena. They were long masters of the sea. In the plastic arts, in painting and in sculpture, they attained almost equal heights. And so on. So that it would perhaps hardly be an unfair claim that all the great arts upon which early Rome was built, were but copies, and perhaps pale copies, of Etruscan antetypes. And Etruria certainly had many arts that Rome did not take over, having, as her part, different objects in the world.

The Etruscans said they came from Lydia. That origin is confirmed for them by 22 writers, every ancient historian except Dionysius; and the reasons for his dissent are most remarkable. They are two: that Xanthus, a well-informed Lydian historian and antiquary, does not mention the migration;

second, that neither in language, religion nor customs were the races similar (as he found them in his day). This simply means that what connexion there was, was prehistoric even to Xanthus and Dionysius; and on noting the other points of the case we will see indeed that the connexion must have been prehistoric. The threads of her civilization lead us into too many regions for us to restrict her origin to the then modern Lydia.

An interesting problem here comes in. The chief difficulty of the Etruscan problem has hitherto been that historians have looked at her as well as at Trojans and Pelasgi, all in the Graeco-Roman room as it were, seeing, like Dionysius of Halicarnassus, nothing outside of that; or as our good people in the West have only seen in Egypt the place where the Hebrews were said to have stayed a while. But if the Etruscans, with all the other customs we are about to note, differentiating them so greatly from every known ancient nation, still came from Troy; and if back of their wonderful civilization, with all its arts, engineering works, and the rest, shown in the Etruria of the Roman historian, and preserved in the tombs of this latter type, we still find as at Caere another great cycle, as of the tunnel-tomb first described, with its wonderful contents, Egyptian-like yet still Etruscan, and its Trojan construction, accompanied by tombs having inscriptions of syllabaries, as well as alphabets — and all still Pelasgic (that is, mind you, "early Greek") — Query: How old was the Trojan War, and who were the Trojans and Lydians?

A syllabary, of course, takes us away to Japan, Tibet, early Chinese, and the origins of what we know as Sanskrit.

From such evidences as have survived, the Etruscan language was probably agglutinative. That takes us to the Finno-Tartaric cycle, and to the languages of all America, which preserved the agglutinative type, subject to a particular American modification. And this test of inner form of language is the one most lasting and ineffaceable ethnic guide-post.

If Taylor's analysis of the Etruscan numerals is correct, they used not a decimal but a vigesimal count; this takes us to all America, and parts of Asia.

Descent in Etruria was kept in the female line.

almost more than in the male. The son took his mother's name. Her tomb was often finer than her husband's, and her position in society was far beyond that of woman in Greece and Rome, in dignity and respect.

What has come to us of Etruscan religion has been so mingled with the later elements that only in some few respects can we see beyond. We find three chief gods, with a council of twelve, six of each sex, called Dii Consentes; the names of these latter it was forbidden to utter, yet they were not eternal, but rose and fell together. And back of all were the "shrouded gods," whom even the supreme Tinia obeyed. Writers have called the Etruscan religion Oriental, gloomy, imperious, mystical, a dominant religion, not an exponent of national character "like the free creed of the Greeks." But the same writers acknowledge that it was "an all-pervading principle of life," and that it gave the Etruscans a pre-eminently religious name in antiquity, and that it bound the cities of the confederacy in harmony, and made civil strife unknown. One of the Etruscan cities was specially honored by the Delphic oracle for its refusal to engage in piracy, on motives simply of honor and right.

They were given acknowledged pre-eminence in the arts of divination beyond all Greeks and Romans.

And finally, their so-called "ancestor-worship" links them to Egypt, China and most ancient Japan. To Etruria Rome owes her Lares, and it is more than probable that this entire question was in Etruria linked with reverence of the "home." The character of this "worship" in these different nations differs markedly. In China it is a reverence for the dead as "Fathers"; in Japan they are thought of as living spiritual protectors, the embodiment of all past thoughts and greatness of the nation; Egypt and Etruria both cut and furnished rock homes for the dead, but with one marked distinction. In the former mummification and entombment was part of the "initiation of life," part of the great drama of the reincarnating pilgrim; the Etruscan tombs were built and furnished to carry forward the life of the personality. Yet in spite of this evidence of decadence, Etruria, like these others, has preserved something the modern West does not understand.

What "ancestor-worship," its inner meaning and origin, may be, is beyond our present purpose, but a hint may be had in these conjoined ideas of different races, and also in two of their words. The Etruscan Lares were the "Leaders, the Guides"; and when the name of Buddha is expressed in written Chinese, it may be by using any one of several different characters nearly alike in sound, but meaning ancestor, or higher place, up-stairs, and added to the personal name: so implying in his case the accomplished union (the at-one-ment, or yoga) of the man with his "Father in the place above," (and this final element, by the way, is entirely distinct from the ordinary character for the material)

heaven. The worship of ancestors is a recognition of the deathlessness of the immortal Man, an acknowledgment of our Higher Selves.

These are some of the fragments of the problem of the successive yet united, Etruscan civilizations. Who will piece their pattern together? W. E. G.

✻ The Trend of Twentieth Century Science ✻

"The Dangers of Under-Eating"

TO every popular movement, good or bad, there is presently a reaction. It was time for a reaction in the less-food movement started by Mr. Fletcher—not, however, "time" in the sense that a reaction was desirable. It is voiced by a well-known physician in the columns of a monthly contemporary, and the argument or synopsis is in the title—*The Dangers of Under-eating*.

First: we should eat very generously, because nature is prodigal. If she wants one fish she causes the production of a million eggs. Therefore if we need an ounce of food and would imitate her we should eat—how much? The argument might be extended. Of a million rays of light emitted by the sun only seven or eight reach the planets; the rest are "wasted." Shall I, therefore, when I hoe a piece of ground, give six or seven strokes of the hoe to the proper place and a million all around and into the air?

Second: we should eat lavishly because the body is built on a lavish scale. A part of one lung would do all the ordinarily necessary breathing work; we have two whole ones; and so on. But it was never contended that we should cut our eating down so low that the quantity would suffice for the actually necessary half or third of the body, for a third of the lungs, one kidney, a fifth of the liver, and so on. The contention is that we should reduce food to that quantity which will suffice for the whole. At present many people eat as if they had two or even three bodies.

Third: the struggle for existence, constituting natural selection, has eliminated those who varied in the direction of the tendency to eat too much, since they were unable to compete successfully with those who had moderated appetites. Therefore all the existing appetites are what they should be. Only in the rarest case, after all these millenniums of struggle, can an individual arise with the slightest tendency to eat too much! Let the drug stores now testify! And according to the same argument and by the same process every other vicious or sensual appetite should have been eliminated. There should be no diseases due to vice; there should even be no one with a tendency to lie in bed a moment too long!

Fourthly: appetite, being a natural preservative instinct, *must* on the whole direct wisely. It must; but appetite is now a very different thing from desire for the pleasant sensation imparted by the tastes of food. The latter endures long after the former is satisfied; but few of us can now indicate the line. The natural animal has not made candy-stores and restaurants to excite his mind every twenty steps of every journey he makes. We have used our minds to super-add a pseudo-appetite to the real thing. Then we get this:

Of the forty-two principal causes of death in the United States census of 1900 only three are to be found which are in any way due or possibly related to overfeeding—diseases of the stomach, diseases of the liver, and diabetes.

One may say on the contrary that long years of overfeeding, which means continuous over-

work for all the apparatus of digestion and assimilation, is a good foundation for any disease whatever which may finally accrue. The doctor enumerates four or five diseases frequently due to *under-feeding*, and responsible for 30 per cent of all the deaths. Setting aside such causes as bad hygiene, want of air and light and drainage, excessive hours, overwork, mental depression and anxiety, we should say that the percentage of this 30 due to under-feeding comes down to a very small figure; that the under-feeding in these cases is below the amount advocated by the less-food movement; and that even the reduced percentage is much more the result of *bad feeding* than of *under-feeding*. An underfed infant for instance, stands a better chance than a badly fed one.

Over-feeding is nearly universal in the west. Whatever the extremes to which a reaction went, it could hardly approach the sum of injury now being done by excess. STUDENT

Ice Perils

SINCE, during this particular phase of its evolution, when so many unwise things are done, our nation eats and drinks a Himalaya of ice every day, the health authorities are statistically speculating how much of our national maladies may be due—not to the habit of ice-eating; they have not got to that yet; but—to the bacterial contamination of the material. A writer in the *Atlantic Monthly*, summarizing the science side of the matter, argues for a special group of inspectors.

Most people think that ice must necessarily be pure. That is true for the individual ice crystal; but what may lie *between* it and its neighbor? A pond freezes from the top downward. The crystals advance like a line of soldiers, pushing impurities in front of them and practically letting none through. Moreover, as the surface film protects the depths from disturbance by wind, the impurities are able to settle peacefully to the bottom. This sort of ice may be taken as pure except on its upper and lower surfaces. The writer points out, however, that the dealer may resort to two expedients which may result in its harboring any amount of impurity. He may "flow" his ice. That is, after the surface layer has been formed (with its covering of bacterial or other dirt) he may make holes and let the water beneath flow up and freeze. The original surface is now embedded in the midst of the mass. Repetition of this process causes the final product to be a sandwich of alternate layers of ice and bacteria. Or he may strip off the surfaces as they form, lay them one upon another and freeze them together—with the same result, the sandwich.

Artificially made ice is frozen in metal receptacles. The freezing layer advances inward to the center, finally accumulating there all the impurities of the water, if any, and freezing them in. Anyone getting that center piece is likely to be in trouble. Usually, however, the dealer stops the process a little before that, cracks the mass, and lets the condensed impurities escape in the remaining water.

Experiment revealed some interesting facts about bacterial life. If the ice in which the bacteria are frozen contains some nourishment for them and is not shot through with sunlight, that is, if it is kept in the dark, it may be taken far below the freezing point without killing them—at any rate without killing certain varieties of them. Some are killed at once, but these do not include our chief enemy, the typhoid bacillus. Nourishment or not, if the ice is well penetrated by sunlight, or, probably, by blue rays from the arc light, practically all the bacteria will be dead in a short period of from two weeks upward. If there is no nourishment, storage alone will in some longer period kill them all. Experiment showed that within the limits of a single species, say the typhoid species, there were sub-species absolutely indistinguishable except by their differing power of resistance to prolonged cold.

The writer therefore argues for natural ice, long stored, free from its surface layer, not "flowed" or "layered," and handled with proper precautions against contamination. If artificial ice is used the question is rather of the water from which it is formed.

STUDENT

Watering the Food

IN some cases at any rate, the apophthegm *do not drink during meals* may have its last word changed to *mouthfuls*. To a recent meeting of the American Medical Association two physicians submitted the results of an experiment bearing on the question. But as the experiments dealt with one man only, some further work is obviously necessary.

This man was given a fixed diet for six days, all necessary data as to his condition having been taken. For the following five days he had the same diet but with the addition of rather more than a pint of water during each meal. During a third period of eight days succeeding, the water was withdrawn again.

By the end of the second period the man was in better health, weighed two pounds more, digested more quickly and his intestinal canal harbored fewer bacteria. These improvements continued throughout the third period. The only stipulation was that mastication should be carefully done.

In that stipulation lay the essential. For most of the digestive work of the saliva is done during the act of mastication. And as saliva bears a great deal of dilution it could continue its work beyond the mouth. The gastric juices were not diluted by the drinking. They are mostly secreted after the meal is over, and water taken during the meal is quickly absorbed. But it would seem better, nevertheless, to do the drinking before the meal, say half an hour.

If one watches the eating at a restaurant one will see people drinking during a *mouthful*. This means the *substitution* of the water for saliva in order to save time or from pure ignorance. Healthy saliva is an antiseptic as well as a digestive, and the practice spoils the work of both functions. M. D.

The Moon and the Weather

A SCIENTIFIC writer considers the popular beliefs concerning the position of the horns of the new moon as an indication of wet or dry weather; mentions the firm belief of many people, especially sailors, in the truth of these signs, and goes on to show that the positions in question depend upon cyclically recurring positions of the moon with regard to the sun. His arguments against the truth of this method of prediction are that science knows of no causal connexion and that the weather would also have to be cyclically recurring (which he assumes it is not). Consequently he takes refuge in the argument:

The tradition that the crescent of the "new" moon, when nearly horizontal, foretells a "dry month," or when nearly vertical a "wet month," is too absurd to be refuted, as it is without any foundation whatever. Like most other so-called "signs," those who accept them do so from coincidences observed. Cases which prove the "signs" are noted, but those which do not are neglected, and we are convinced only because we wish to be convinced.

Suspending judgment on the merits of this controversy, one may examine the case for the negative and find it so deficient in logic as to constitute a presumption in favor of the affirmative side. Sailors note the signs favorable to their belief and neglect those unfavorable. But they must have a reason for noting the one set and ignoring the other, otherwise they might just as easily come to the opposite conclusion namely, that a horizontal moon foretells a wet month and a vertical one a dry month. They are convinced because they wish to be convinced. But why do they wish to be convinced? What has led them to the conclusion, which they seek by malobservation to vindicate, that the moon thus indicates the weather? Is not this the crucial point? And has not the speaker for the opposition left it unanswered? He may have shown that the belief is not supported by the facts, but he has not shown the reason for the belief. There is therefore a strong presumption that there are other reasons, of which he is not aware, together with a suspicion that the malobservation, due to the desire to be convinced, may as well be on one side of the controversy as the other. The argument that the tradition is without any foundation whatever, is an assumption, since the most that is proved (if it be proved at all), is that the tradition is without support from orthodox scientific views of astronomy and meteorology.

With regard to recurring cycles, it may be pointed out that taking all factors into consideration, there is no identical recurrence of any configuration within the limits of millions of years. The ancient Hindû tables use a cycle of 4,320,000 years as a multiple contain-

ing the various cycles of the revolutions, nodal revolutions, and apsidal revolutions, of the celestial bodies, in numbers which have no common factor. Hence, if we take into account every element in the moon's movements, its position might coincide with the weather without our being able to detect a recurring cycle. It seems likely that the popular tradition constitutes a *fragment* of ancient knowledge, in which other factors besides the position of the horns were taken into account. This would account both for the persistence of the belief and for its shortcomings in the light of astronomy. To this it might be added that the sailors are probably able to note many more things concerning the moon's appearance than they are able to formulate or describe; so that their predictions may be more reliable than are the reasons they give for them.

Universally we find such scraps of ancient lore, and the belief in them is inveterate. This indicates that they had a credible origin, however far they may by now have wandered from it into the mazes of vagueness and inaccuracy. It would be more reasonable to try to piece them together. All future events are connected with past and passing events by a complex skein of causation, and the art of tracing this out and so forecasting the future is difficult but not impossible. Of more importance, perhaps, than the signs themselves are the effects which the signs may produce on the feelings of the observer; perhaps, indeed, the meaning of the word "sign" ought to be extended so as to include this effect. Many animals can foretell the approach of a season that calls for action on their part, and may provide

for it months ahead, as is often observed.

The moon may be seen in an upright or recumbent posture, with or without a halo, over the left shoulder, through glass; or the change of phase may occur at such and such an hour of the twenty-four; are not all these things just unpieced scraps of a lost science? Separately considered, no one of them can be wholly true, though each probably has a limited value. This limited value, added to the sailor's intuition, which enables him to seize certain indications that he cannot formulate, serve to keep the belief alive. But sceptics often behave as they might do if they dug up a bone and said, "This bone could never have walked and talked; therefore the belief that it is a human bone is absurd." STUDENT

Lizard Entombed in Rock

THE instances of frogs or toads being found imbedded in solid rock are too common for anyone who has a well-balanced judgment to reject them as fables. People do not invent this kind of fables, nor are all the observers deficient in observing power and common sense. It requires more credulity to disbelieve the stories than to believe them; unless one has previously made up one's mind that a toad cannot possibly be found in a rock.

A newspaper report says that in a coal mine near Great Falls, Montana, a miner found a lizard about nine feet from the surface imbedded in the solid rock. There was no conceivable way by which it could have entered the cavity. The reptile was torpid; but when brought to the sun, it showed more signs of returning life after its long sleep. E.

FROM THE PRELUDE TO
SONGS BEFORE SUNRISE

FOR Pleasure slumberless and pale,
And Passion with rejected veil,
Pass, and the tempest-footed throng
Of hours that follow them with song
Till their feet flag and voices fail,
And lips that were so loud so long
Learn silence, or a wearier wail;
So keen is change, and time so strong,
To weave the robes of life and rend
And weave again till life have end.

But weak is change, but strengthless time,
To take the light from heaven, or climb
The hills of heaven with wasting feet.
Songs they can stop that earth found meet,
But the stars keep their ageless rhyme;
Flowers they can slay that spring thought sweet,
But the stars keep their spring sublime;
Passions and pleasures can defeat,
Actions and agonies control,
And life and death, but not the soul.

Swinburne

The Question of Impulse

IN these latter days when the foundations of modern faiths appear to be decaying away, the number of those who are seeking and finding pearls of wisdom in the teachings of Theosophy is rapidly on the increase. Each man does this in his own way. How else could he do it? The results of his study must inevitably be in line with his own individual capacity. But this individuality is also evidently but one facet of the power which we all possess, to recognize the Truth which is beyond personality.

In this search the dim instinctive sight which is continually ahead of us, and which must precede actual knowledge and realized wisdom, is much helped by a sort of primary comprehension of that which we later on know and realize as an actuality. Put it which way we will, all real progress in the evolution of the man by any sort of education, amounts to this. He who has fully recognized this is beyond the pale of authoritative creed and dogma, depending as he must do, on his own internal experience as his only real guide and final arbitrator.

The Secret Doctrine of Madame Blavatsky sets forth the origin of the Cosmos and of man in a sketch of a magnificent scheme, the knowledge of which has been handed down from the divine Sages of antiquity. It appeals to every sense of reason and intuitive knowledge which man now possesses, and explains with such transcendent lucidity the deepest problems of the universe, that although we cannot actually fully know of its truth of our own limited knowledge, yet we accept it as true with unwavering instinct, because in every detail it appeals to our highest conceptions. We cannot find any flaws in it, and the

longer we study it, the more we are convinced that behind the present revelation, there are boundless fields of potential wisdom.

For our present purpose, it is sufficient to confine ourselves to two important ideas, embodied in these teachings.

The first is: that man and the worlds and everything that exists, were projected into existence from the divine center of all being; so that when the apparently separate beings thus created had enriched themselves by experience, they should return to the center from which they came.

The second is: that the whole universe is nothing more nor less than "embodied consciousness."

In speaking of man, H. P. Blavatsky states that he is a "powerful consciousness."

The fact that consciousness is so little understood and realized has been the cause of endless perversions of the truth. The subject is of course far too wide to go into in detail; but when it is understood that everything, seen and unseen, is endowed with some kind of intelligence or consciousness, it will more readily be realized that man, the highest being in visible nature, is something which is far higher than a merely conscious being, for he is *self* conscious, and thus can potentially come in touch with every being in the universe, because consciousness in the abstract is *one*.

The Secret Doctrine furthermore explains that for the purpose of experience the first division of the primal consciousness resulted in a duality of spirit-consciousness and matter-consciousness; and that these, by a wonderfully harmonious system of septenaries, have resulted in the existing diversities, all of which however will finally be gathered back into their primal cause.

This is the basis of all the noble teachings of antiquity, of the great religions of India and of Egypt, from which Christianity was derived, and its history is writ in the Bibles of every race.

Looking at human existence from this point of view, it is at once evident that no impulse within us is derived from any other source than the original one which called mankind into being; and also that no impulse has any other object than to produce a further experience of consciousness.

The return to divinity which is the end in view, is accomplished by the knowledge of good and evil, which in their ultimate realization are the same as altruism and selfishness, compassion and inertness, or spirit and matter.

The teaching of Theosophy furthermore is that the great cycle of the descent of man's spiritual consciousness into the material, and its subsequent redemption, is accomplished by a period which may be compared to a vast drama of seven acts, each of which has seven scenes, in which the curtain rises and falls many, many times, and the scenery is changed in endless variety. In this drama the heroic soul of man plays many parts, forgetting in each one the details of the part he played before, but learning in each one some special experiences in consciousness.

The question now arises: what immediate lesson can we derive from the teachings of the Secret Doctrine on these two questions of Impulse and Consciousness when we have realized and tested them for ourselves? The knowledge that every impulse comes from

within and that we have the power of discrimination with regard to it, is of great service to us. The characters of the higher and lower impulses are well known. The lower are those that bear the stamp of the separate self, the animal personality; pride, anger, self-seeking, and desire in any form, and even in the more shadowy analogues of ambition, annoyance, querulousness, and unrestfulness, are caused by the material consciousness; whilst the fruits of the Spirit are, as enumerated by Paul, Love, Joy, Peace, Longsuffering, Gentleness, Goodness, Faith, Meekness, Temperance. Our whole effort is directed towards the subjugation of the former states of consciousness, and the inducement of the latter. It is a question of self-government. In each case, the impulses arise from the opposite poles of our dual nature.

Thus the teaching that we are "altogether born in sin" is not true. But it is true that we are "born of God." The spiritual influence in which we are bathed, if we will have it so, is that of the Holy Ghost, the divine Christos. And the path of experience, which we are destined to tread, will ultimately bring us to the point of its full realization.

An ancient Indian scripture says:

A man is said to be confirmed in spiritual knowledge when he forsaketh every desire which entereth into his heart.

He who, while living in this world, and before the liberation of the soul from the body, can resist the impulse arising from desire and anger is a devotee and blessed.

It cannot be too often repeated that all of the great religious teachers of every age, the essence of whose teachings has always been the same, have continually dwelt upon the "great heresy of separateness." Whatever may be our ideas of spirit, or of spiritual consciousness, one point is clear — its first essential characteristic is its broad loving compassionate sympathy. It is the Sun that "shines on the evil and on the good," although the former may not know it. But once they turn to it, they may perceive it shining for them also. They become a part of it when they allow it to shine through them by their conscious sympathy with and love for others. There is no separateness in the divine part of man's nature.

Most of the parables of Jesus the Nazarene illustrate this. The joy of the Father at the return of the prodigal son, is contrasted with the selfish jealousy of the neophyte elder son who had not yet fully seen his father — and become one with him. The sympathy of the Good Samaritan, is contrasted with the selfishness of those who left the outcast lying by the roadside.

The outrageously material ideas of heaven and hell which dogmatic religion has substituted for the true teachings — that these are but states of consciousness resulting from good or evil choice — are hardly yet forgotten, although they are now rarely accepted. The question as to how anyone would *feel* under given circumstances, has been misused, but the appeal has always been, even then, to a question of *consciousness*. In these days we know too well that dwelling even in a gorgeous palace, a man may really be in hell; whilst the cruel deaths of those who have given their lives for what they believed to be the truth, sufficiently prove that heavenly ecstasy may exist in a fiery furnace which consumed the body.

The all-consuming compassionate sympathy which reckes not of outward surroundings, is a possible state of which this material age knows but little. To the extent we do not know of it, we are lacking in divine spiritual knowledge, and we can only reach it by knocking at the door of our spiritual imagination. That it has existed in all ages, we have abundant historical evidence, and it needs but studious attention to perceive the first glimmerings of its glorious reality.

There is somewhere a poem for children of which the first line runs:

If I were a king with a golden crown.

We have forgotten the rest of it. But it is perhaps interesting for each of us to dwell for a moment upon what would be the result to each of us, supposing it came true. Should we be jealous of our dignity, worried with our responsibilities, filled with the vanity of selfhood, easily impressed by flattery — which are all selfish personal material experiences of consciousness? If so, our crown would be of lead, and indeed Shakespeare's wise saying, "uneasy lies the head that wears a crown," would be true. But there is another possibility. We might be so deeply impressed with the love of all men that our opportunity to promote justice, teach mercy, promote public well-being, act the peace-maker, improve the condition of the poor and suffering, would bring lasting joy to ourselves and to those whom we could influence. And then indeed our crown would be one of golden light.

It is all a question of consciousness, and not of surroundings. Which of us that is wise would not rather be a slave like Epictetus, or die such a death as Socrates, than live the life of selfishness which has led many a millionaire to suicide or despair?

It is all a question of the government of the impulse which gave us birth, and keeps us alive, so that we may rightly judge of good and evil. This can only be done by realizing the cross of material consciousness behind which lies the Crown of self-government, through the Spiritual Will.

No change of outer environment can effect this. We must accept the truth that human consciousness is one, and that we can affect it by every deed and thought which come into our daily life. We must take upon ourselves the sins of mankind, produced by inexperience and ignorance of the truth, and realize generally that bad men are only potentially good men gone wrong. This is the teaching of Theosophy. STUDENT

THEOSOPHICAL FORUM

Conducted by J. H. Fussell

Question What does Theosophy teach with regard to the recognition of friends in future lives?

Answer That we shall recognize them, if they are friends, without a doubt. That we do recognize them, life after life. Is anyone friendless? The reason for that is in his own nature, no doubt; he wears too many prickles, is too fenced round with selfishness.

We should not fear losing our friends if we considered for what purpose we are here, and why life is such a jolting, uneasy business,

with no peace for the wicked, and very little for any of us (unless we make it for ourselves). We come into life and find ourselves among friends from the start, in all probability, for there is such a thing as family affection; most of us are born among those who love us. Then we go forth through life, meeting and mixing with all sorts and conditions of men; some we need no adjusting to; some we never become adjusted to; some we jolt and jar upon until we grow used to them, then friendship grows up quietly.

Think what an orchestra would sound like, were the instruments all at such sixes and sevens as we are in this grand pandemonium of kakophony, the world. We play our own instrument without even regard to tune; we let our own individual lives run the gamut of the discords; we do not order them, but run off into a million stridencies of passions and jealousies and insane living. Listen to each one separately, and how few you will find to be playing anything remotely resembling a tune — what sort of music, then, can be coming from the great orchestra as a whole?

Now and again two players are thrown together who play in harmony with each other; that is what we call a friendship. How long it shall last, depends entirely upon the kind of music they are playing. The music set before them is the grandest of symphonies; but they may be playing some jig or passionate matter of their own, with no eye to the written notes or to the baton. Their whim coincides for the moment, but the sequence of their moods will not be the same for long. The one will find the other diverging from him after a while, and the jar of their disharmony will be the greater, the more they set store upon their concord while it lasted. That kind of friendship is not worth much; it may endure for a life or more, or break in a few months or years. But follow the baton and play the music, and you are at one with all who may be doing the same.

Withal we are very sensitive; we love neither discord nor kakaphony. That no possible harmony can come between our notes and our neighbors', is a distinct grievance. It wears upon our nerves to hear so much cat-music; as it is very right that it should. We tend to modify our braying, and our neighbor tends to modify his. Discord always grows towards its own death, not being acceptable on any hand. Here we are, humanity; set down in this orchestra of the world, provided with instruments; the order is, play; do your part, learn your instrument, learn the great symphony, play together and produce harmony.

The end of our evolution is harmony. If we know a few persons, and understand and love but a few now, we have to grow and be exercised until we know and understand and love the whole race. That does not imply any miracle in the way of universal personal acquaintance at any one time. Whoever is eager for the same things as we are, if those things are at all deep and impersonal, he is necessarily united to us, and our thoughts and feelings are strengthened and enriched by his strivings.

So we are always being thrown into the company of these people and those; and their experience and character act upon us as the sea acts upon the pebbles, rounding us and bringing us to perfect shape. We get some in-

sight into a man's mind, and it is a warning or a beckoning hand to us; if there are wholesome depths there, we ourselves are a little deepened; what jagged roughnesses there may be will wear down our roughnesses and be worn down by them in turn. If there be some correspondence of purpose and aspiration below, ties are made and a friendship formed that are definite steps towards the universal harmony.

Are those to be undone? Will nature, having troubled to make them, lightly cast them aside? Why should we fear then, the loss of friends? Even death does not effect separation; because the star that was between friends, the aspiration that united them, remains; that they both saw it was the link between them while both were living; and its brilliance is still seen by them, and fed by their thought and eagerness, now that one of them is, as we say, dead. Because birth and death are little more to the soul than a change of garment is to the body.

Water finds its own level, and so do men. Those whom we know are always coming to us, if they have not already arrived. The person whom you are to meet (for the first time, apparently), next week, and who from the first is to be no stranger, but like an old friend to you — do you suppose that you did not know him of old, and wear down then any barriers that were between you? Harmony or friendship, like all things else, has to be worked for and won; we make a little more of it, or else waste our time, in every life that we live.

What more could there be in the recognition of a friend, than in the recognition of the friendship as existing? We shall not know what their names were before, any more than we shall know what our own names were; or do know now what our names or our friends' names were in the lives that are already past; but the knowledge would not be particularly interesting. We shall know the common purpose, the old reliabilities, the flame and color of his being, as now. We shall not regret the passing of any form, for we shall not remember any form to regret. What then? If our friendships are based upon form, we had better bury them at once; they hold no quality from beyond time. We and our friends, in that case, are but playing some little rag-time jig together, which we shall both grow mightily sick of, before long.

The object of our education in this school of the world, to which we return for life-term after life-term, is to learn at last perfect accord and friendship with every human being, so that there shall be no depths of life incomprehensible to us, no rich feeling or experience sealed. Every true friendship is a nucleole of universal harmony, and as such, a thing precious to the Law, treasured by the powers that guide our evolution. A true friendship, absolutely speaking, is one that is based on a common aspiration for the good of humanity; one into which self is not admitted, and any friendship is of value only in so far as it approaches this ideal. It cannot be broken, except by one thing; and that is a lowering of ideals on one side or the other. We lose our own personalities and forget them with each rebirth, and all things personal are lost and forgotten. But nothing belonging to the soul is ever lost. STUDENT

THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY

FOUNDED AT NEW YORK CITY IN 1875 BY H. P. BLAVATSKY, WILLIAM Q. JUDGE AND OTHERS
REORGANIZED IN 1898 BY KATHERINE TINGLEY

C e n t r a l O f f i c e P o i n t L o m a C a l i f o r n i a

The Headquarters of the Society at Point Loma with the buildings and grounds, are no "Community" "Settlement" or "Colony." They form no experiment in Socialism, Communism, or anything of similar nature, but are the Central Executive Office of an international organization where the business of the same is carried on, and where the teachings of Theosophy are being demonstrated. Midway 'twixt East and West, where the rising Sun of Progress and Enlightenment shall one day stand at full meridian, the Headquarters of the Society unite the philosophic Orient with the practical West

An Indictment of Modern "Civilization"

IN *T. P.'s Weekly* (London) is a review of a book called *The Condition of England*, which (or at least the reviewer's impression of it) strikes a deep note of pessimism. But before commenting on it, it may be as well to say that the case should not be regarded as applying to England particularly, but taken as typical of Western civilization — as indeed the reviewer says, in more than one place, instancing America. An Englishman naturally writes of his own country; but others have written in similar strain from their own local points of view. To quote from the review (italics ours):

On the whole the evidence is irresistible, and points most fatally in one direction. England, which stands here for *modern civilization*, is going down quick into the pit, into the material pit, and into the spiritual pit. Mr. Masterman takes one class after another, states the pros and cons with admirable lucidity, states the results of his personal observation, of the observation of others, . . . gives us the evidence of the country parson and of the Socialist agitator, dissects the plutocrat, the city clerk, the farm laborer, and, as I understand him, sees on every face the awful seal and lineaments of death.

It is not that we are more vicious or less moral than our forefathers; we are not, but

I cannot help deducing from Mr. Masterman's pages his belief in the existence of a *universal and a deadly malady*. . . *It is materialism*. England rots and decays and moulders because for four hundred years she has been saying, with greater and greater emphasis, that man can live by bread alone. And the bread has turned to poison in her lips. The plutocrat professes his materialism by means of magnificent palaces, innumerable motor-cars, and unending material pleasures; the Socialist echoes the same creed by demanding a re-adjustment of material goods; the man of the middle classes slaves for his snug villa and his smug suburban joys; the working-man cries for perennial fountains of beer and everlasting football spectacles. Religion . . . is all but extinct, surviving chiefly in weak philanthropies and in the futilities of "Pleasant Sunday Afternoons." The Holy of Holies has become a decent lecture-room, where well-meaning people discuss "ground values" and ethical truisms.

All alike, rich and poor, high and low, Radical and Tory, are not content to affirm that cakes, ale, and ginger are excellent and worthy creatures; in practice, if not in theory, they all agree that there is *nothing in the universe except ginger, cakes, and ale*, and that all else is mere moonshine and cobweb and worn-out fable. And the worst of it is that thinking people are beginning to suspect that the ale and ginger and cakes are all adulterate, if not actively venomous.

MEMBERSHIP

In the Universal Brotherhood and Theosophical Society may be either "at large" or in a local Branch. Adhesion to the principle of Universal Brotherhood is the only prerequisite to membership. The Organization represents no particular creed; it is entirely unsectarian, and includes professors of all faiths, only exacting from each member that large toleration of the beliefs of others which he desires them to exhibit towards his own.

Applications for membership in a Branch should be addressed to the local Director; for membership "at large" to G. de Purucker, Membership Secretary, International Theosophical Headquarters, Point Loma, California.

As to the state of the country-side, the following is quoted from the book:

"Whole ancient skilled occupations . . . are becoming lost arts in rural England. Behind the appearance of a feverish prosperity, . . . we can discern the passing of a race of men. . . 'There is no social life at all,' writes a Somerset clergyman. 'A village which once fed, clothed, policed, and regulated itself cannot now dig its own wells or build its own barns. Still less can it act its own dramas, build its own church, or organize its own work and play. It is *pathetically helpless in everything*.'"

As to the former state, we read:

"The evidence is abundant and positive . . . that the work done upon the fabrics of our churches and the other work done in the beautifying of the interior of our churches, such as the wood-carving of our screens, the painting of the lovely figures in the panels of those screens, the embroidery of the banners and vestments, the frescoes on the walls, the engraving of the monumental brasses, the stained glass in the windows, and all that vast aggregate of artistic achievements which existed in immense profusion in our village churches till the frightful spoliation of those who stripped them bare — all this was executed by local artists."

And the primary thought suggested, says the author, is —

"How beautiful the lives of those who made and adorned the churches must have been."

And the reviewer adds:

Their fathers carved the golden angels; they cannot make a hedge or graft an apple. And the smoke and dust of the motor-car go up to heaven.

But this must not be taken as an advocacy of that reactionary medievalism for which certain ecclesiastical influences are putting in a plea. It was no reactionary or anachronistic spirit that made those lives glad.

Thus much for the country-side; now for suburbia:

"Its male population is engaged in all its working hours in small crowded offices, under artificial light, doing immense sums, adding up other men's accounts, writing other men's letters." It has many respectabilities and even virtues, this population; "and yet at the end, . . . one closes the narrative

with a feeling of desolation; a revolt against a life which, with all its energies and satisfactions, has somehow lost from it that zest and sparkle and inner glow of accepted adventure which alone would seem to give human life significance."

Turning from the quiet London suburbs to the great whirlpool of America, there the author finds evident delirium.

The reviewer concludes:

It is, as I read it, a powerful indictment against the whole fabric of modern "civilization," a declaration that our modern life, far from being civilized, is fast putrefying into a barren and futile barbarism. It has rejected the things of the spirit, the gleam of high adventure; it has resolved, as I have said, to live by bread alone. And, with grim irony, its judgment is that this bread turns out to be alum and bone-dust, bitter and deadly in the mouth.

Nothing can be more certain than that in the absence of any counteracting influences, such a state of affairs as is described above must result in a catastrophe involving the partial, if not the total, destruction of civilization. For the very material concerns upon which the people are relying have only been secured to them by the faithful work of people now passing rapidly away; and the power that created this affluence is not being renewed. The capital upon which we are living must inevitably become exhausted. And then we shall be bankrupt, not only spiritually and in character, but outwardly and in resources also. There will not even be cakes and ale. Given that the conditions as described above are a true picture, the sequel can be deduced with the certainty of a mathematical equation. When the forces of decay are accelerating, and no new life is being generated, death is the inevitable result. Civilization, if it is as above represented, must collapse, either utterly, or to a point at which the people will be aroused to new and saving energy.

But is civilization as bad as that? If we regard the surface only, perhaps it is; perhaps it is even worse. But there are also mighty forces at work stirring the people to seek anew the forces of life. Our author has put very strongly the case for one side of the debate; an opponent might have made out a very strong case for the other side. He might have pointed to the *universal stir in search of something real and permanent*. But even then, our author would have had a rejoinder ready: he could have said that the apparent interest of people in reform movements and lofty speculations is all so much airy froth; or, if not

that, is at least futile and hopeless. And he would not have been far from wrong. For what strikes one most about the aspirations and speculations of today is their vagueness, their want of direction, their lack of unity, their helplessness. Aspirations that do not result in achievements are of no use. And it may well be argued that the momentum of decay is too great to be stopped by anything that can materialize out of these haphazard aspirations.

To the churches we look in vain, for they are themselves caught in the net of materialism and have no new light whatever to shed. Science is still of such a character that its very name is identified with materialism; it aids the progress of materialism rather than hinders it. Where are we to look? It is idle to answer this question by referring to more theories. A Wisdom-Religion is needed. Results alone can count. And this the world will soon find out when, turning in desperation from the brink towards which it is speeding in its auto, it appeals to that which alone has any results to show—the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY. Nothing else has been able, or shows any signs of being likely to be able, to render the spiritual life a living reality to men. But Theosophy *can* induce people to forsake the mad rush of personal aims and return to the old life of service, finding therein the only true happiness. And this will be demonstrated.

Speaking of modern art in connexion with what was said about the ancient craftsmanship, the writer describes it as being unoriginal, fitful, and fragmentary, revealing no beauty in the lives of the people, as did that ancient art. How can beauty be brought back into our lives, and the greatest of all arts—the art of living—from which the subsidiary arts spring, be restored? We seem to have lost the life-principle and to have nothing but physical vitality left—and even that is going. It is the presence of the life-principle that makes life glad; circumstances count for little, or adapt themselves to the needs of the man who has life—or rather there is mutual adjustment between his temperament and his lot. Physical vitality will not suffice, for it is impermanent; without this more interior vitality it cannot be retained; it cannot be managed; it becomes a burden. Where is the never-failing inner fountain of strength, the exhaustless store of joy and energy that supplies all needs and maintains equilibrium?

Here again the answer is that we must *know ourselves*—recognize the reality of our spiritual nature and cultivate it. But religion can no longer show us that way; and it remains for Theosophy to do it. ALBION

How to Instil Discipline

IN a review of a book on education by Dr. Eliot of Harvard, it is said that he believes in the training of the will, not by the method of imposing another's will, but by the proper adjustment of freedom and responsibility. This combination is to be reached by the early, systematic, and persistent cultivation in the minds of the young of the idea of service. The habit of considering, not oneself alone, but oneself as a member of a family, a group, a class, a community, a race, is broadening and steady; and is a corrective to narrowness and most forms of folly.

But, in order that this solidarity may be more than a sentiment or theory, we need to

the desires are, and how the passions are intrusive forces masquerading as the Self and thus creating a fictitious personality. All these things should be taught both intellectually and practically. But the teacher needs to be himself a Theosophist, believing in and practising the same principles.

The presence of these conditions can accomplish that which is impossible in their absence; and the strength of the Theosophical position is equally demonstrated by its own success and by the failure of other means.

How can we instil discipline into the characters of the young without tyrannizing over them? By teaching them to recognize and obey Laws that are not man-made but inherent in human nature. But we must be in a position

Lomaland Photo. and Engraving Dept.

ONE VIEW OF THE INTERNATIONAL THEOSOPHICAL HEADQUARTERS, POINT LOMA, CALIFORNIA

cultivate our spiritual nature more. And we should be much helped in this if we had philosophical and religious teachings which recognized man's spiritual nature as a fact and showed us its laws and method of culture. We require to know how to evoke in a group of people a real and definite sense of their solidarity, as a distinct experience, and as a power strong enough to sway their conduct. For this purpose the Theosophical teachings are needed.

The teachings as to the tripartite nature of the soul—its distinction into Divine, human, and animal—are not to be found, except very vaguely, in religious teachings. Yet these teachings constitute a necessary key to all understanding of human nature and how to deal with it.

The young should be shown that their mind is the battlefield of two opposing influences: the one from the selfish animal nature, inspiring to shortsighted selfishness and self-indulgence; the other from the Higher Self, inspiring to wise action in the common interest. They should be shown how tyrannous

to demonstrate those Laws; and, as aforesaid, it takes Theosophists to do that. The teachers must sufficiently have mastered the Theosophical teachings and applied them practically to the conduct of their own lives, to be able to transmit what they have learned to their young charges. Otherwise we shall but have a case of the blind leading the blind. E.

THE Secret Doctrine . . . teaches that the whole universe is ruled by intelligent and semi-intelligent Forces and Powers, as stated from the very beginning. Christian Theology admits and even enforces belief in such, but makes an arbitrary division and refers to them as "Angels" and "Devils." Science denies the existence of such, and ridicules the very idea. Spiritualists believe in the Spirits of the Dead, and, outside these, deny entirely any other kind or class of invisible beings. The Occultists and Kabalists are thus the only rational expounders of the ancient traditions, which have now culminated in dogmatic faith on the one hand, and dogmatic denials on the other.—*The Secret Doctrine*, H. P. Blavatsky

Science and Solidarity

THE emergence of a new epoch in thought is illustrated by such articles as "The Unnecessary Curse of Sickness," in *The World's Work* for July. In this article we find the case for solidarity put in a novel light. It is shown by practical common-sense arguments that solidarity is indeed the fundamental law of human life, which cannot be ignored with impunity; and that if we will not prosper in unison, the Law will make us suffer in unison.

The article shows, by many figures, the immense waste which civilization incurs from preventable sickness. An anecdote is narrated describing the trouble, expense, and loss of time occasioned by the blundering of a clerk who was afflicted with chronic dyspepsia and could not concentrate his mind on his duties. In other respects this man was competent; and if he had attended to his health, all that trouble would have been spared. Every business establishment has to keep a contingent of understudies ready to replace the ailing. "Ill-health of all sorts and degrees is playing havoc with the orderly conduct of the nation's affairs."

Formerly we labored under two errors with regard to disease. We believed that it was dealt out indiscriminately by Providence upon good and bad, rich and poor; hence our interest in it was academic rather than practical. Again, we thought that sickness concerned only the afflicted individual and possibly a few intimates.

We had not yet learned to think in collective terms. . . . Our faith in the gospel of "each for himself, and the devil take the hindmost," had not yet been seriously shaken.

Any interest we might take in a sick stranger looked like a gratuitous display of generosity.

But science has set us right on these points. The most harmful kind of sickness is the epidemic kind. We cannot overcome this by the unaided efforts of one man.

We are daily being taught how intimately our fortunes . . . are interwoven. We are beginning to grasp the futility of planning the welfare of any one human being apart from the rest of his kind. *We are coming to think of ourselves, at last, as links in a chain so firmly bound together that when the devil grabs the hindmost the wretch is felt by the topmost—felt in the very marrow of his bones.*

Thus, it seems, science has demonstrated to us that *solidarity is the law of life*. The churches have been preaching brotherhood at us for ages, but they do not seem to have made us realize that it is the law of life. Perhaps their method of beginning by informing man that his nature is "desperately wicked" has handicapped them. Ecclesiasticism has dwelt too much on the evil in human nature, and has tended to represent the good rather as something extraneous and foreign to human nature, to be acquired by means of special grace. But here we have science assuring us that brotherhood is a radical essential quality of human nature. This is surely a better way of regarding the matter, and perhaps it will enable science to succeed where the churches have failed and to make men realize the fact of their solidarity.

The assumption that we are separate from each other is false and brings us into conflict with the facts. We can no longer get along

on such an assumption. Science has made the nerves of society so sensitive that the fact of its unity has become obvious, and we are obliged to recognize it.

But let us extend the range of this moral. If it applies so forcibly in the case of physical disease, what about moral disease? *Are we separate in our minds and hearts?* Or is that notion likewise a superstition of the past, destined to vanish in the light of science? How much money and time does the nation lose per year over preventable moral infirmities? Doubtless the figures for this, if given, would dwarf the other figures into insignificance. And the worst form of moral disease is the epidemic or catching kind, which cannot be exterminated by individual effort but demands co-operation. You, who are cherishing an impure thought, are you sinning alone? Or are you like the butler mentioned in the article who carried a typhoid bacillus into a

THE DREAMER

A DREAMER of dreams men called him,
And passed him by with a smile—
An idler in life's great market,
A scorned of things worth while.

One said to him: "Buy, sell, barter—
The world will worship your gains;
And losses are not for the fighter
Who feels red blood in his veins."

Another, who feared his dreaming,
Threw stones and railed at his word,
And cried: "Down, down with the scoffer!
No more shall his voice be heard."

The dreamer turned not from his dreaming;
The noise of bargain and sale,
The triumph of those who conquer,
The envy of those who fail,

The taunt of the prosecutor
That filled the reluctant years,
Smote ears that were strained to listen
For the music of other spheres.

Undaunted he held to his vision,
Unconquered by man or creed;
An empty hand at the plowshare—
But God was sowing the seed.

A dreamer of dreams men called him,
Vain as unending youth;
Yet one day the dull earth blossomed,
And lo, the flowers of truth!

Louise Montgomery — *Selected*.

house and infected all the family? And where did you get that evil thought from? Is it your own, or did you get it from a germ-laden moral atmosphere?

We are not separate from each other on any plane. Solidarity is the law of life everywhere, and to our sorrow do we attempt to ignore it. Every individual owes it as a duty to the community to keep himself clean in all respects; and collective efforts for dealing with moral epidemics and contagion are called for.

We cannot get away from it. Materialism may have set us digging into the uttermost depths of the earth, but the divine law has said, "There am I also." The momentum of our descent into the abyss of materialism is destined to give us the needed impetus on the way up the ascending arc. H. T. E.

Prayer Book Revision

THE conscience and intelligence of the Church of England have obviously outstripped the Book of Common Prayer, as for some time past there has been an agitation for its revision. The feature which is most repugnant to the enlightened mind is the so-called Athanasian Creed, which contains the well-known minatory clauses directed against those who find the Creed more than they can believe. At present its use in all its medieval style is imperatively ordained. In 1907 a Committee of the Lower House of Convocation was appointed to consider the question of revision, and now their report has been submitted. The Lower House of the Convocation of Canterbury has at the time of writing arrived at a compromise with regard to the use of the minatory clauses of this Creed, which Matthew Arnold said represented the Church in an angry mood. The arrangement suggested is that the Creed shall be retained in the Prayer Book, without the existing Rubric which commands its use on certain occasions, so that a clergyman may, if he dislike the Creed, refrain from using it, while the minister who has not got beyond the spirit of the Creed may use it if he be so pleased. It is also suggested that a form of the Creed minus the objectionable clauses be drawn up.

An alternative description to Matthew Arnold's is that the Athanasian Creed "indicates the position of a Church which had to define with exceeding plainness and with indignant force its tenets, as against the suggestion of heretics and controversialists." It would seem however that time is on the side of the heretics, and the present attitude of the Church of England as represented by the Lower House of Convocation of Canterbury, towards the Athanasian Creed, is a concession to those to whom the "old theology" is becoming as "a creed outworn." The author of this particular creed is not known, but it has nevertheless for so many hundreds of years been accepted as expressing the Christian Faith, along with the Apostle's Creed and the Nicene Creed.

F. J. UDALL, M. J. I.

The Rigidity of the Earth

IT is pointed out by a recent writer that assuming radium to be the only heat source in the earth — while noting its absence from volcanic matter, and that the earth's heat is practically constant — the deduction from the known percentage present in the crust would be that it is only about thirty miles thick, a result arrived at by Milne from the velocity of earthquake propagations. A similar result had been reached by pendulum observations in India and elsewhere, the estimated thickness, however, being forty miles. This is one-two-hundredth part of the diameter. There does not appear to be a solution of the problem of the enormous rigidity of a thin shell like this, nor how the earth has "the rigidity of a steel globe," if there be only a thin shell. The steadiness of the earth at Mount Wilson, for example, must be very great, when with the new sixty-inch reflector a star can remain perfectly bisected on the spider lines for several minutes at a time. This instrument is floated in mercury, a principle advocated long ago by Sir Howard Grubb, Dublin. There must be some unknown factor making for rigidity, it would seem. STUDENT

Art Music Literature and the Drama

The Pioneer Struggles of Richard Wagner

VIEWING from a safe distance of a few decades the life work of our men and women of genius, we are as one regarding a far away mountain top, its perilous crags softened by the kindly perspective and its summit suffused and glorified by the radiance of the setting sun. "What soul more favored by the gods," exclaims the easy-going dilettante, "than Richard Wagner! How glorious to be a pioneer, to carry the standard of a new art into the enemy's country and to plant it there! How glorious to climb the path of fame! What an inspiration must have been every day of his life, even every hour!"

But was it so? What are the facts? Wagner today is recognized as one of the very greatest of interpreters in the world of music. He had a great message to deliver, the message of the Soul Unconquerable and the Divinity of Man, and he delivered it, in some ways in the most superb and appropriate idiom that music had furnished from prehistoric days until his own time. At the close of his life he stood, it is true, with the goal in sight, and with the standard of a free musical art, an art dedicated to the ethical needs of mankind, firmly planted and no longer even needing defense. But at what cost was this won! As with all true pioneers, Wagner had to pass through untold discouragement, years of unrelenting struggle against seemingly hopeless odds, and he staggered under all the bitterness and cruel suffering that an ignorant public and the jealousy of contemporary musicians could inflict upon him.

"You write such eccentric stuff that no one can sing it," said the great Devrient when the first performance of *Tannhäuser* wrote itself down as failure. *Tannhäuser's* wonderful recitative describing his pilgrimage to Rome was accounted "pointless and empty"; the critics with one acclaim dismissed the music-drama as "without either melody or form," "so distressing that it made one nervous," and so on. It is not surprising that the young Wagner wrote to a friend shortly afterwards: "a feeling of complete isolation overcame me."

Wagner knew what the public demanded and what the critics would have praised. A weaker soul would have receded — there was the bread and butter question, and why challenge ridicule and the bombardment of jealousy and pettiness any longer? But Wagner merely stood the more firmly. One single possibility he considered, as he tells us in his memoirs — "to induce the public to understand and to participate in my aims as an artist." And he stood alone even among such musical giants as Spohr, who found in *Tannhäuser* "several ugly attacks on one's ears";

Mendelssohn, who suggested that "a canonical answer in the adagio of the second finale" would have pleased him better; and Hauptmann, who pronounced the Overture "atrocious." Even honest, courageous Schumann, who was himself so far in advance of his time, wrote: "It [*Tannhäuser*] contains deeper, more original, and altogether an hundred-fold better things than his previous operas — at the same time a good deal that is musically trivial. On the whole Wagner may become of great importance and significance to the stage. . . . Already he has finished a new text-book, *Lohengrin*."

Lomaland Photo. and Engraving Dept.

RICHARD WAGNER

WAGNER

Fragment

O WAGNER, westward bring thy heavenly art,
No trifter thou: Siegfried and Wotan be
Names for big ballads of the modern heart.

Thine ears hear deeper than thine eyes can see.
Voice of the monstrous mill, the shouting mart,

Not less of airy cloud and wave and tree,

Thou, thou, if even to thyself unknown,

Hast power to say the Time in terms of tone.

Sidney Lanier

But *Lohengrin* fared no better. Indeed, the world of music criticism fairly descended to Billingsgate in the effort to ridicule and condemn, if it did not succeed in obscuring, the very works of Richard Wagner which today hold audiences spellbound. And this means that the young, enthusiastic, brave and unselfish pioneer got his full quota of suffer-

ing. It is not surprising that Wagner's attitude towards the musical world of his day was always somewhat defiant, nor that he plunged into writing for relief, and even harbored dreams of political aid and reform to the end of establishing a national theater with all its corollary advantages to struggling musicians and composers.

The first performance of *Lohengrin* took place at Weimar in 1850, under the direction of Franz Liszt. Poor Wagner had by that time risen to a more humorous view of the situation, for he dismissed, with an irony as light as it was cutting, the indifference and disapproval of the critics with these words, "Musicians had no objection to my dabbling in poetry and poets admitted my musical attainments!"

In 1860 Wagner arranged for the performance of selections from his operas in Paris, by means of orchestral and choral concerts, the Overture of the *Flying Dutchman*, four pieces from *Tannhäuser*, three from *Lohengrin* and the Prelude to *Tristan*. "Un parti très-ardent, très-actif, s'était formé autour de Wagner; les ennemis ne s'endormaient pas davantage, et il était évident que la bataille serait acharnée." At the end of nearly a year of incessant worry, annoyance and siege Wagner returned to Germany, covered with disappointment and loaded with debt, to find that the news of his fiasco had preceded him and had killed in advance all the enthusiasm with which he would, had he met with success, have been welcomed home.

There is not space to touch upon Wagner's magnum opus, the Nibelungen Tetralogy, of his later success, of the appreciation which at last came to be meted out to him, of the establishment of his work at Bayreuth, of the wonderful understanding of a true philosophy of life

as revealed in his *Lebenserinnerungen* or autobiography. His life held the struggle of the pioneer, and its lesson is that of peace in the midst of turmoil, of an inner calm unruffled by outer discouragements. Not that Wagner possessed the inner calm and peace at all times. Far from it. But he did remain forever nobly undiscouraged. Cliques and cabals created their world of suffering and broke their jealous storms over his head, and the great oak labored and swayed, suffered and groaned under the pressure and the tumult, but it never bent, and it never fell to earth broken. There was that in the man which was indomitable and the real inner history of his life, if written, would be an inspiration to all who, like him, aspire and strive. To the easy, undisciplined many, who expect some day, somehow, to arrive at commanding armies without the preliminary trouble of drilling in the ranks or of suffering in the silence, his life is a subject to ponder over. H.

Let us work with all the divine energy of the Soul for higher ideals, for a purer life.—Katherine Tingley

The Eternal Now

LIFE demands of each at every turn of thought and hand an honest answer to one stern question, variously put, yet ever this one: To which party do you belong? to which party?

The soul, seeking physical form, answers: See here the body, the place, in which I wish to dwell. Behold these with whom I choose now to surround myself; these are my kind. This is the field I but lately sowed and here, with great interest, will I gather a new harvest.

The soul, going out, answers: Mine was such an experience as I most wanted. These with whom I lived and whom I helped were my beloved always. That which I did and thought was of the sort that belongs to me to think and do.

To which party? We are of the light or shadow; going uphill or down; helping or hurting; and from the foundation of the world the moment of choice between them was NOW.

In this moment to close and bar the door against all the coarse crowd that has long sat idling at our fireside, eating at our expense! In this moment to choose better, freer, cleaner companionship! NOW!

In this moment we might take our little children by the hand and go in search of something better for them than we have had. They came to us in days of ignorance, it seemed, but was not their very coming a challenge? They knew where to ask for the great opportunities of life. We are not now the parents of little irresponsible human creatures who have taken up a temporary residence in our homes. We are far-journeying souls charged with the guidance of souls, blessed with their companionship from of old.

Now we shake off this heaviness; we see; we know; and somehow, we must acquire the strength to do. Who knows what traps have been laid for the darling feet while we slumbered? Now we set them in paths of pure

Righteousness, where they deserve to be. And now for them, for us, the old question dies away and out of the silent places of our happy hearts is newly heard a familiar clear voice: *This is your party. These are your people.* Now, go on! STUDENT

Theosophy is itself the highest moral code.

The ethics are there (in the Theosophical teachings) ready and clear enough for whomsoever would follow them. They are the essence and cream of the world's ethics, gathered from the teachings of all the world's great reformers.

Theosophy . . . is Divine Science and a code of ethics so sublime that no Theosophist is capable of doing it justice.

Gentle kindness to all beings, strict honesty, virtuous habits, strict truthfulness, and temperance in all things; these alone are the keys that unlock the doors of earthly happiness.

To live to benefit mankind is the first step.

A true Theosophist must put in practice the loftiest moral ideal.

From the writings of Helena Petrovna Blavatsky

The Science of Common Sense

THE mother who is monopolized by her home duties while she has longings for a career, may be assured that the noble work of solving a problem which has proved too difficult for the scientists depends upon her. Insanity is increasing at an alarming rate and the types of cases that were formerly curable are becoming more hopeless. This condition prevails notwithstanding the unusual amount of attention which the experts have given to the study and treatment of mental and nervous diseases.

The elaborate resources of modern scientific diagnosis and treatment having confessedly failed to keep pace with abnormal mental

conditions, the only hope lies in prevention. As the causative factors are deep-seated, prevention must begin long before any symptoms appear—in early infancy.

The average young mother who reads insanity statistics feels that the subject does not closely concern her. Probably the mothers of the many now insane felt equally secure and unconcerned about the matter, yet most of the cases have some abnormal predisposition which might have been overcome by proper discipline and training, although it would as certainly develop if it were misguided or were given free range.

Our alienists agree that the characteristic common to all insane types is an affection of the moral nature. Whatever mental distortions may be present, there is always the disproportionate personal feeling which throws the patient out of right relation to his fellows—in a word, the social or brotherhood sense is defective. Selfishness which ignores the natural brotherhood of humanity is immoral because it is unnatural.

The solution of the insanity problem, then, must begin at the cradle—if not before—and this ultra-scientific work can only be done by mothers. In spite of protests of devotion, with rare exceptions children have always been held too cheaply by their parents, who therefore have failed to do them justice. The old theology, with its belittling belief that individuals had souls that could be lost, obscured the truth that they were immortal souls with divine powers underlying the superficial impulses of the lower nature. Nothing less than the Theosophic conception of the child's dual nature will explain and justify the training necessary to direct his natural forces away from enervating habits—open and secret—and to conserve this energy for the upbuilding and strengthening of his mental and moral nature.

Without a guiding knowledge of Theosophy how many mothers are guiltless of cultivating

a more or less subtle egotism in their children from babyhood up? How many are wise enough to recognize, and courageous enough to defeat, the desires and demands of the insistent and insidious lower nature? The indelible impressions of the early years should be made with a view to their lasting influence upon the course of this and future lives.

Aside from the cruder forms of mental indulgence which cater or at least yield to, the child's capricious appetites, tempers, and selfishness, there is also a frequent failure to teach him how to cultivate an active, generous, wholesome, responsible character. Even a naturally good disposition is often only a negative virtue, and the child is untrained in any positive moral force of will which can serve to protect him under the stress and strain of personal experience and also save him from being victimized by the chaotic and injurious ideas and impulses which are epidemic in the present world of thought and feeling. Where the energies of the child are expended in normal, purposeful, harmonious activities, the abnormal bias becomes weakened and a physical, mental, and moral resistance is established in its place.

The children who have had the benefit of the Râja Yoga training are striking examples of the poise which results from systematic self-control and a free expression along the higher lines of sane living. By this method the currents of abnormal heredity can be deflected into normal channels to a degree that can never be done by this, much less by any other system, in later years.

The mother who sets up an intelligent standard of normal living for her family and holds to it is doing the morally creative work of the world. This is the science of common sense that alone can solve the adult problems which are so baffling to the experts, and when mothers rise to the heights of a clearer vision, attaining that finer discrimination which enables them to know what are their real duties and what are not, the race will have gone a long way towards the only possible solution of this problem of insanity. Theosophy stands for saneness of life and sanity means equilibrium, poise, balance; and Râja Yoga is Theosophy in its practical demonstration. M. D.

Agathe Backer-Grøndahl

TWO years have passed since the close of a life which was rich in service to the music-love of the world. "She is the equal of Grieg," said Leschetizsky of Agathe Backer-Grøndahl, Norway's greatest woman composer and one of the greatest of the present day. When the news of her death was broken to Grieg he was almost crushed

the next few years many of the great lights of the musical world recognized her unique and rare genius, among them the violinist Ole Bull, Hans von Bülow and the magician Liszt.

For many years Mme. Backer-Grøndahl appeared in concert, mainly through Norway, Finland, and Sweden, and was acknowledged as a masterly interpreter of Chopin and also

Beethoven. During her more recent tours she played chiefly her own compositions, and to the interpretation of them brought a richness that was the rare fruitage of a long period of retirement when she divided her time between the duties of a wife and mother — for three sons survive her — and her beloved compositions.

Agathe Backer-Grøndahl should be better known in America than is the case today, but that is partly due to the fact that like Grieg she never crossed the Atlantic. During the later years of her life she became totally deaf, yet her latest compositions are pronounced by critics to be among her very best, many possessing a mystical suggestiveness that her early works express far less clearly. Her last *opus* — and the list of her works numbers seventy — was composed during intense suffering.

Chief among her compositions are four Concert-Etudes, *Dance of the Mist*, a poetic, almost ethereal composition, *Prelude and Minuet*, and a number of lyrical pieces and lesser works. Her life was filled to the brim with hard and purposeful work. A great happiness was hers in congenial home surroundings, but physical suffering played a large part, and perhaps a needed one, in her life. Must not growth — all growth

— come through suffering, and can it come in any other way? Pain is a wise and compassionate teacher.

The soul of Norway speaks through her compositions and it spoke and thrilled through her superb interpretations of the music of others. One of her sons is today recognized as the foremost Scandinavian interpreter of Grieg's music, and the best of his mother's musical life and aspiration is finding expression today through the wonderful playing of Fridtjof Backer-Grøndahl — not strange, since the mother so well interpreted the ideal. VIEW OF A PART OF THE TANK WATER-SUPPLY SYSTEM, ADEN

under the blow, for the two had been close friends for many years. "I shall soon follow her," he said, and the words were prophetic, for three months later he also passed away.

In early childhood the little Agathe was fragile of constitution and somewhat melancholy of disposition, passionately fond of music but without the advantages of music training until her ninth year. But her progress when she was placed under teachers was rapid and at the age of seventeen this shy young girl gave her first concert, playing Beethoven's E flat major *Concerto*. Within

OUR YOUNG FOLK

Whose Side Are You On?

"I'm sure I don't know why I should be so bothered about deciding which is right and which is wrong, when I truly desire to do right," said Nell.

"Well, I'll tell you, Nell," answered her brother, "you think too much about it."

"Why, Tom, how can you say that when I am being told so often, 'Look before you leap,' and 'Think three times before you speak,' and 'Be sure you're right—then act,' that sometimes I am afraid to move for fear of doing the wrong thing."

"Oh, send Fear to the bottom of the sea!" said Tom.

"I wish I could," said Nell, "but I don't see how that would help me to decide things."

"Well," said Tom, "if you had no fear in your heart you would instantly know what was right and dare to do it and then pay no more attention to it."

"But Tom, are you not advising me to ignore the warnings 'Think three times before you speak,' 'Be sure you're right—then act,' and 'Look before you leap'?" asked Nell.

"Oh no I'm not," said Tom. "I am only giving you an easier one. Why don't you challenge yourself every time, and say 'Whose side are you on? the Fear side, or the Courage side?' Then for an instant you will feel free and be able to see the right course of action."

"Well," said Nell, "if it will help me to decide things, I shall try the challenge, 'Whose side are you on?'" E. W.

The Wireless Telegraph

IT was on December 12, 1901, that the world was first assured of the successful communication between Cornwall and Nova Scotia, a distance of two thousand miles across the Atlantic, by "wireless." Since that time much has been accomplished towards making this means of communication practical, and today we hear of scores of lives saved by the vital messages flashing through the air. For flashed through the air they are, without any visible means.

This has been made possible by the discovery of the existence of the electro-magnetic waves and the invention of apparatus to make use of them. The apparatus for creating electro-magnetic waves is quite simple. In one instrument electric batteries are used, of which the circuit is broken. Ordinarily when the wire between the poles is cut, the current will not pass over the gap as the air offers too great a resistance. But by passing the current through a transformer, which has the same effect as when a stream of water is passed through a nozzle, a high-tension current is obtained which will bridge the gap of an inch between two brass balls fastened to the batteries. Attached to one of the brass balls is a wire which runs up a tall mast. The sparks which are

A RESIN-GATHERER AT WORK IN
THE PINE FORESTS OF THE LANDES, FRANCE

THE TWINS

THE old man and his apple-tree
Are verging close on eighty-three;
'Twas planted there when he was two,
And almost side by side they grew.
How strong and straight they were at eight,
One leafy, one with curly pate!
How fine at twenty, how alive
And prosperous at twenty-five!
What health and grace in every limb,
Was said of it—was said of him!

And now that they are eighty-three
They're almost as they used to be.
The blossoms are as pink and white,
The old man's heart as pure and light.
The apples—fragrant balls of flame—
Are looking, tasting, just the same.
And just the same his uttered thought
Of mirth and wisdom quaintly wrought.
Through all their years they kept their truth,
Their strength and that sweet look of youth.

Ethelwyn Wetherald

caused by the current leaping from ball to ball, set up electric pulsations which run up the wire and cause electro-magnetic waves to be radiated into space. We have a similar effect when a stone is dropped into water, wave after wave radiates outward. But there are other waves in nature. Air waves are caused by the disturbance which a rifle makes when fired into the air. So, also, when electro-magnetic waves are set up, air waves are caused.

But air is not necessary in the sending of electric waves because they move in ether and will go through any substance except metal. Thus they could move in space devoid of air.

The receiving instrument is similar to the sending instrument except that a coherer is used instead of the transformer and the brass balls. The coherer is a small glass tube having between two silver plugs in a space of about an eighth of an inch, silver and nickel filings. The two wires from the batteries run into this tube through the plugs, but the filings act as a non-conductor and so the circuit is broken. There are also in the tube the ends of two other wires which are attached to the wire running up the mast. When the electric waves strike the wire on the mast the filings cohere and become a conductor allowing the current from the battery to flow through. A tap on the tube will make them de-cohere and stop the current. Thus the battery current is able to operate a Morse printing instrument and an electro-magnet, which makes the filings de-cohere, according to the series of waves coming down the wire from the mast.

Waves can be sent in long or short series as the operator wishes, with his telegraphic key to make and break the circuit. Thus it is evident how signals are made and translated. As waves can be sent any length it is necessary that the sending and receiving apparatus which are different in mechanism be tuned alike. That is, both must send out electric waves of the same length. This is called "syntony."

It takes an enormous power to send waves a long distance and have them print at the receiving station, so an apparatus has been invented in which local power is used and assists in the printing.

Many inventions and discoveries have been made along the line of wireless telegraphy, and it is interesting to notice that the successful results are not the product of one mind, but that many have laid the foundation upon which the "wireless" is successfully operated. It is a great triumph of this age and makes one confident that Nature has still many subtle forces that are waiting for man's discovery and use. H. M.

Gathering Resin in France

THE sandy plains in south-western France were once covered by the sea. To protect them against the waves, all along the sea coast pine trees have been planted, the roots of which hold the sand together and help to withstand the encroachments of the sea. Large quantities of resin are obtained in the pine forests thus formed, the cut on this page showing a resin-gatherer at work. The chief industry of the interior of this sandy region is sheep-raising, which has been illustrated in previous cuts that showed the shepherds and shepherdesses of the Landes on stilts while on guard over their flocks. L.

THE CHILDREN'S HOUR

IN MY GARDEN

DEATH to the weeds! With my spade and hoe
I fight against them, they must not grow.
Beautiful flowers with fragrance rare,
And herbs for healing are planted there.
Death to the weeds in my growing mind!
Selfish desires which kill and blind.
Flowers of wisdom and love have been
Planted there by the soul within.—*Aea*

Hospitality and What Came of It

IN the days of the old Greeks, there was a beautiful spirit of hospitality among the people. Any stranger or wanderer who came to the door was welcomed, and the best fare the house afforded was set before him.

It was not unusual in those days for the gods to come to earth and mingle with men; and usually they came disguised, so that a host did not know when he was kind to a mere beggar, but he might be entertaining a god unawares.

However, in one city a very selfish man began to reason with himself that he owed nothing to the stranger who came to his door, and therefore he was not in duty bound to give him food and shelter. After convincing himself of this, he straightway talked it over with his neighbor, and the neighbor talked to others, until the ideas spread over the whole city; and instead of the old kindly custom prevailing, the city became known far and wide for its hard-hearted and wicked inhabitants.

On the outskirts of the city dwelt an old couple, Philemon and Baucis by name. These good folks bemoaned the sad condition of affairs, and did all they could to help to keep up the old custom.

One evening there came to the city a tall, noble looking man with a handsome youth, who carried a staff wreathed with two snakes. These strangers sought shelter at many a door, but instead of a welcome, they received insults; and at last a crowd collected and followed them through the streets, jeering at them.

When Philemon and Baucis saw the strangers they hastened to meet them, and offered them shelter, assuring them that, though poor, they were honored to share their humble fare with the wanderers.

The strangers gladly accepted; and soon Baucis had set before them the best she had, which was only some bread and milk, with honey and a few grapes from a vine in the garden.

While they were eating Baucis noticed that though they filled and refilled their cups with the milk, that instead of the pitcher becoming empty, as she feared, it remained filled to the brim; and she whispered what she had noticed to her husband. Then they watched more closely. Sure enough, not only did the pitcher refill itself, but there was more honey, and the grapes had changed from the poor little grapes Baucis had put on the table into great luscious clusters.

The wise old couple, however, kept silent about what they saw, although they were more than astonished at what had happened.

Lomaland Photo. and Engraving Dept.

THE LITTLE GARDENERS

When the strangers rose from the table they said they were very weary, so Baucis led them to the only bed they had, while she and her husband lay down to rest on the kitchen floor.

Early in the morning Philemon and Baucis arose, for they wanted to prepare the best breakfast they could for their guests; but while they were doing so the strangers appeared in the doorway.

"Come, follow us to the hill-top," said the elder. There was something so commanding in his voice, that without a word Philemon and Baucis followed. When they reached the hill-top the strangers turned, and the elder said: "Good people, know that the strangers you have so kindly and graciously entertained are no less than gods. Look now at your city."

They looked, and behold! where had stood the city was now a beautiful, shining lake; and in place of their own little cottage, there stood a large magnificent temple of marble and gold. Overcome with awe, the old couple remained speechless.

Then the god, who was none other than Jupiter, said: "My good people, you, of all the city are the only ones that have been saved, and your humble cottage I have changed into a temple of the gods. Ask me for any favor you please and I will grant it."

Quickly the old couple answered: "Grant us, we pray you, to be the guardians of your temple; and that when we die, we may go together, so that neither may mourn the other."

"Your wish shall be granted," said Jupiter, and instantly both gods vanished.

Then Philemon and Baucis guarded the temple until they were very old; and one evening as they sat before the temple door, they were thinking that life had grown rather

wearisome, and that they would like a rest, when suddenly they both vanished. In their stead stood two majestic trees; and these stood for centuries before the temple of Jupiter, and sheltered thousands of people who sat to rest beneath their branches, and heard the story of Philemon and Baucis. J.

The Tomte

THERE is a "tissel and tassel" down in the corner under the stairs that lead up from the cellar. What can it be? A little mouse? Oh, no! Just wait a minute and you will see! There he comes, the good little elf, or *tomte*, as he is called in Sweden. It is his house down there, under a tub. He is not taller than my hand, is dressed in a gray suit and a red, pointed cap. He has a long gray beard and many, many wrinkles on his face. His eyes look so bright and kind you cannot help liking him, the good old soul. For good he is indeed, the old *tomte*, and it is only in the homes of good people that he wants to live. Wherever he goes he brings happiness and prosperity.

During the night, when all are asleep, the *tomte* is busy. He cleans and dusts and sweeps. Everything must be nice and shiny when his friends wake up in the morning. Through the whole house he goes to see that all is in order. Quietly, on tip-toe, he enters the room where the children slumber so sweetly. He looks around, and when he finds all the toys put back into their places and the clothes folded together neatly on the chair, he is happy. He loves to see that the children are neat and orderly and do their little duties faithfully. And the little ones smile, when in their dreams they see their old *tomte*. B.

THE SECRET DOCTRINE

THE
Synthesis of Science, Religion, and Philosophy

By H. P. BLAVATSKY

2 Vols., Royal 8vo., about 1500 pages; cloth.
(Index of 30 Pages as in First Edition)

NEW POINT LOMA EDITION IN PREPARATION

To be reprinted from the original edition of 1888, as published by H. P. Blavatsky

Vol. I treats of Cosmogogenesis
Vol. II treats of Anthropogenesis

Postage prepaid - - - - - \$10.00

THE THEOSOPHICAL PUBLISHING CO., Point Loma, Cal.

God in Nature

IN all branches of science today may be noticed the strong setting in of a return-tide towards the recognition of "god" in the universe; but this god is not the old arbitrary theological ruler come back again. The school of scientific thought that is now passing away was considered atheistical and opposed to the recognition of deity, because it either denied or ignored deity; those who still accepted god did not allow him to enter into their scientific speculations but kept him separate for Sunday use. This school of science came in on a wave of reaction from blind belief in an arbitrary creator and ruler to a belief in law and order. The enthusiasm over the discovery of method and system in the operations of Nature was so great that the awful question of ultimate causes escaped attention. The minds of the great researchers were fitted for observation and for generalization of their observations, but were not of the meditative kind that penetrates into origins. It was illogically presumed that the discovery of method and law in Nature obviated the necessity for a deity; and men of science accepted in place of a god those natural forces with which they were familiar and for which they felt no awe.

Forces are not Self-Created

But what has been the result of a close probing into these forces? It is that science has found that instead of the comparative simplicity which the superficiality of its earlier investigations had led it to assume, there is everywhere endless depth and complexity. It has found that the marvelous work of Nature, however wrought, can only be the result of design and intelligent purpose; that even if we place "forces" instead of intelligences, these forces must be equivalent to the very intelligence we have repudiated, for their action and effects are the same.

Thinkers in Nature Everywhere

The idea of being in the continual presence of deity was too much for some minds; perhaps because theology had converted that conception into a burden and a horror. But now men of science are feeling their way towards the recognition, if not of a god, at least of the universal presence of thought and thinkers in Nature. And this is surely a more reasonable attitude than the old theological one. It is a great error to jump at one bound to ultimate causes; there are such things as proximate or intermediate causes.

We have prided ourselves greatly on our monotheism, but monotheism is not every-

thing. As a reaction from a degenerated polytheism it may at times be useful. But there is truth in polytheism. The formula, "There is but one Supreme God," should be complemented by the corollary, "And countless are Its intelligent agents."

We are beginning to recognize that the real unit in Nature is the Being. The "atom" and the "cell" are seen to be but effects, emerging upon the plane of perception; and, so far from being causes, they themselves need the predication of causes to explain their behavior. As science is fond of generalization and likes to see uniformity everywhere, it can indulge its tastes by bringing the inorganic, chemical, and physical domains of its researches into line with the organic. A hive is seen to accumulate gradually a cellular structure of yellow wax, and the cells fill with luscious honey. Is this the work of blind forces acting under the laws of affinity? We do not say so, because we can see the bees; they are big and visible and we can watch them at work. Neither do we say that God made the honey, though (in a sense) that is true. Why need we reason otherwise in regard to the cell or the atom? They are smaller than the hive, yet for what does mere size count? Are not they, in their turn, perhaps the work of tiny lives — tiny according to our own (arbitrary?) scale of measurement; but is there such a thing as absolute size?

We can discover no limits to the scale of organized beings, save the limits of our own perceptions. The microscope reveals us smaller beings than we can see with the unaided eye; but beyond those we know there are still smaller ones. When we search beyond these limits we discern only the effects, the motions, produced; but is it logical to assume that these motions, because we fail to descry their origin, are of a different class from other motions — say those of the bees or the microbes? On the contrary, all reason goes to show that the scale of organized intelligent life must be continued beyond the limits of our powers of perception.

Thus we find ourselves in the constant presence of minds and intelligences, but not necessarily of an awful and threatening deity. It is this new revelation of God that science is now called upon to face. The intelligence and will that we feel within ourselves is part of a great universal intelligence; our personality is a bubble or vortex ring in an infinite ether of mind and consciousness.

But in the study of consciousness how im-

portant it is not to jump to too hasty conclusions, too narrow generalizations. It is so easy, once we have assented to the idea of universal mind, to narrow down the conception into a new dogma. As

Nature and Man -- the Same and the Other soon as people get hold of a fragment of truth they want to explain everything by that one fragment. It is not

meant that all Nature is conscious and intelligent in just the same way as man happens to be in his present stage of evolution; that would not be a reasonable conclusion. The study of consciousness is a vast and mighty study, and will be found to present infinite complexities and ramifications. We may admit that the flower we see blooming before us is a conscious intelligent being, and yet deny that it has anything like what we ourselves know as consciousness. The gap between a man and his dog is great; the dog is not self-conscious; he does not form the conception, "I am a dog"; we do not see him winking or smiling or pondering. Yet he is conscious. There are animals which have less consciousness than the dog; some probably which have no separate personal consciousness, as those which live in clusters. The plant, again, is on the other side of a well-defined gap, and its consciousness must be

The Study of Man is the Master-Science different. What is the character of the mind that dwells in the crystal it is hard to conceive, but mind there is of some kind.

The study of the different degrees of consciousness, in man and other beings, is hinted at by H. P. Blavatsky in her published works and more fully explained in her personal teachings to her pupils. It is very profound, and no success can be achieved in it unless the pupil is prepared to make his practice keep pace with his theoretical studies. In fact, the student has to enter upon a course of practical study of human nature, as exemplified in himself and his fellow-men — and this is Rāja Yoga, Divine Magic, true Occultism, the ancient Science of sciences, the Divine Gnosis, the Secret Doctrine, etc. A man may then learn that the normal waking consciousness is not by a long way the only state of consciousness wherein he may exist and intelligently function; and that from the viewpoint of these other planes of consciousness, the world may wear a different aspect and its mysteries be seen in a new light.

Study of Nature is Study of Self Physical science, in so far as it follows its true method of impartial observation and logical inference, approaches the truth; and we see that the earnest students have begun to realize that the study of Nature is really the study of self. And some of them are reaching the further conclusion that there is more than one self within us — that which we usually take for the self being but a pretender, destined, however, to become the fully awakened vehicle of the higher self within. And there are selves within selves. So it is not possible to progress very far in any kind of science without recognizing the all-importance of Rāja Yoga, the great master-Science; and here is where ethics, religion, science, philosophy, and all, meet on the common ground of the WISDOM-RELIGION — Theosophy. STUDENT

The n-th Dimension

THE following notes are intended as a contribution to current discussion on this topic, and as supporting, moreover, the ancient views as to the māyāvic, or illusory, nature of the phenomenal world. Sundry concepts are often confused, while yet the attempt to separate them and define them involves lurking contradictions. Such are the Euclidian attempts to define a line and a surface, involving, even if negatively, the idea of physical extension. Again *dimension* — a measurement ratio, and *direction* — meaning arbitrary directions — are confused with each other and with the idea of space; space, with volume; and volume, with physical extension.

The simplest way to perceive this is to consider a sphere, which is the most perfect ideal surface conceivable, yet without material existence. If we are to use the word dimension in connexion with it, we find, having adopted the distance between two imaginary points on some imaginary straight line as a unit of measurement, that this ideal sphere has only one dimension, its radius — or alternatively, an infinite number of dimensions, each the same; yet this is *not* the radius, after all, but merely the *number* of times the radius is greater or smaller than the imaginary line of reference; for we have no means of knowing whether they are not expanding and contracting all the time, without our perceiving it. So the ideal sphere has only one "dimension," the *ratio* of its radius (or diameter) to something else.

Clearly there is nothing to prevent two equal ideal spheres from approaching, coinciding, and separating; nor would there be anything in such circumstances warranting us in introducing ideas of three *dimensions*, or of three co-ordinate planes, as this would add nothing to the concept, except needless complexity. Just as when a dog is chasing a ball, he does not have to trouble about the position of the roof and walls of a building a mile off.

Length, breadth, and thickness are obviously not properties of the sphere, any more than they are of space. But we can arbitrarily select certain *directions* in space, for the purpose of applying, in those *directions*, dimension ratios; and we can label some of these, "length," "breadth," and "thickness," if we choose. This proceeding does not confer upon space either these or any other number of *directions*, any more than it confers three or any other dimension-ratios. Still less does it confer on space the element of *solidity* or *objectivity*, which is a property of matter or *substance* — however ethereal — not of *space*. More correctly, objectivity is an aspect of consciousness, which consciousness is itself an attribute, however mysterious, of abstract space, which is above, behind, and beyond all form, direction and dimension-ratio.

If we change ground and, instead of confusing "dimension" with "direction," say that by dimension we do not mean direction, but simply the number of numbers needed to define the position of a point, a moment's consideration shows that the number needed may be anything from one to infinity, as the points of reference may be moving relatively to other points of reference, ad infinitum. So that the *n*-th dimension-ratio may be infinite; but this again, does not confer on Space either *n* or any dimension whatever. STUDENT

Magic among the Maoris

WHEN the missionaries first went among the Maoris, they doubtless were filled with pity for those "heathens in their blindness," and probably regarded the priests of the aborigines as being of the same class as the medicine men of other more or less "savage" communities. They hardly dreamed of these priests being possessed of knowledge of Nature's secrets unknown to the white man, and of being able to control some of Nature's finer forces with which the western nations are only now on the slightest of acquaintance. And yet the priest was the historian, the poet, the doctor, the seer of his tribe, combining with his astrology a considerable knowledge of astronomy, and able to perform wonders vouched for by credible European witnesses.

Such, in the view of a writer in the June number of the scientific journal *Knowledge*, was the "tohunga," or Maori priest of old. The knowledge of the priests, he says, was guarded with extreme care, and was only imparted to those of their descendants who were worthy and could be trusted. The priesthood descended from father to son; pupils who were to receive instruction had to submit to tests, and according to the belief of the people, the ordeals partook of the nature of trials of the will-power, accompanied by the use of certain incantations, reminding one of the mantrams of the Hindūs. Some of these incantations — "karakias" in the Maori tongue — have been preserved, but they are so full of allusions to things "we have no knowledge of, that their translations are often to our ideas meaningless."

According to the writer of the article, the particular *karakia* used in the case of these tests was called a "hoa," which, he says, means as nearly as he can translate the word,

exertion of will power for the destruction of some animate or inanimate object, or to affect its state of being. The action of Jesus Christ in withering the fig tree by the wayside would be to the Polynesian mind an exact illustration of the word "hoa."

Those familiar with H. P. Blavatsky's writings will immediately recall instances she gives of the mysterious power of certain sounds, and also the teaching that sound is the source of form. It would appear, therefore, from what the writer of the article in *Knowledge* says, that the Maori priesthood had possession of occult powers which certainly the missionaries could not boast of, and whose exercise would have been by them probably attributed to the Prince of Devils.

Telepathy was to the "tohunga" no mystery.

Instances of direct transference of impressions from one mind to another at a distance are known to have occurred in days not beyond the range of living memory. We have it on the word of educated white men whose names are household words in New Zealand, that the thoughts and feelings of the "tohunga" were endowed with the faculty of locomotion and traveled by other than the material courses of which we are commonly conscious.

Prophetic vision, or a faculty akin to the "second sight" of the Highlander, was, it is stated by this authority — Mr. James Buckland — common among them. He concludes by expressing the belief that we shall discover that these alleged "tricks" have a foundation in fact. Let us add that they are relics of an ancient knowledge inherited by the Polynesians from Atlantis. LONDON STUDENT

Some Views on XXth Century Problems

Practical Philosophy

NO popular movement, no movement in our human thought, can be understood until we have asked ourselves, From what is this a reaction? Then, however groping the new thought, we shall see to what it is pointing, what need it indicates.

God as an unreachable and dreadful potentate becomes God the personal friend with whom you can almost have a chat about your family. The Absolute of austere philosophy sentimentalizes down into the "All-embracing Benevolence" of "New Thought."

This last reaction, however silly or infantile its present products, is, like any other, a reaction. German philosophy, from Kant onward, in trying to explain man and the world in terms of pure thought, had left most of both unaccounted for. Hegel tried to reach back in thought to the Absolute, to Being; and then to come downwards from that height to the world and man as they are. It was a stupendous philosophical effort, but when the down-coming antitheses of thought had ended, where was the man whose existence they were supposed to have explained? Is man no more than the end of an unfolding of *thought*, the unfolding of what was folded in the thought *Being*?

Where is *feeling*? Man has a million feelings for one thought. If he were to listen, say to the whole of the music of Beethoven, one composer only, what vast fields of his own feeling would have been exposed to him! He would have stood on mountain ranges where the air was scarcely breathable, and in flowery valleys where every tenderest color flickered upon the petals; he would have felt the sternest mood of the heroic patriot and shared the light laugh of the merry child.

But all these are folded up in "Being," the Absolute; and they, not thought, are the actual forces and motors of life, the guides of conduct. They it is, that is to say, man proper, which the Occidental philosophies leave unexplained, undealt with. The philosophies are "dry," truly and justly, with little practical value, because they hardly touch life. Real entry into the "Absolute" must be an experience only comparable to the experience at one moment of all the noblest music that was ever written — and more.

A reaction was inevitable, and its forms are sometimes dangerous and sometimes silly. It is recognized that man is a *living* thing and that in the way of his evolution he amasses more and more life. But if life is to be identified with *feeling* as precedent to its state as thought, then in practice there must be accumulation of it. The expenditure must be such as also, and more, accumulates. Sensual feeling may be carried to great intensity; but from the man's side it is *loss* of life. The gain is in a part of consciousness which effects the gain at the man's expense. The ethical maxims of all the teachers are sound philosophy as well as "mere" ethics. The feelings that we all know as "high" are an enrichment of the man's consciousness. Compassion, for instance, whatever the outer gift or deed that manifests it, gives of the man's own life pulse

to him that receives; but it more than equivalently enriches the inner life of him that gives, even if his gift be actually what we call life. Real life can be given, but cannot be given *away*; for it is man's immortality. He that gives his life finds it; after death he will know that; in his next birth he will show it. It is possible to listen to fine music or to read fine poetry, with intent to give, to diffuse, the fine essence they have awakened. The practically philosophic life begins by setting life upon the keynote of giving, of diffusing. We must *become* — not ask things from — the "All-embracing Benevolence." STUDENT

Compassion in Earthquakes

A PROPOS of the second Messina earthquake, the veteran Professor Goldwin Smith re-opens in a New York contemporary the question of an over-ruling Providence, at once omniscient, omnipotent, beneficent:

We have to face the difficulty — great, it must be owned — of reconciling what seem terrible flaws in creation with the omnipotence and omniscience of the Creator.

He is mistaken; the vast majority of the readers of that or any other journal do not "face" that or any other difficulty, do not question the universe as to its purpose and government, do not trouble themselves with any such problems. They could only be made to do so, could hardly be reined up to thought by anything less than an earthquake which shook their own houses into rubbish piles. If it is men's business to think and question, and an earthquake is the only way in which "the Creator" can arouse them, to an earthquake he must resort. Accepting the term for the time, we must remember that "the Creator" would not look at things exactly as we do. The evils of an earthquake, as we see them, are death and pain. Let us try to look at them as "the Creator" would.

Looking from above, then, he sees that death has not the slightest injurious effect upon the continuity of the thread of man's life; sees that man is immortal and after due rest returns again to birth; sees therefore that death, so far as the dier is concerned, is not an evil. That certainly wipes a good deal of the darkness out of the picture.

The pain is for those left behind. Upon this too "the Creator" looks with another eye than ours, one that sees on into the stretches of time. Somewhere, far ahead, he sees a nobly perfected humanity, ripe in compassion, ripe in every power of thought and action. And that humanity, by reason of deathlessness and Reincarnation, is *this one*.

But the ripening and enriching of the soul, as even we know, is attained by suffering. Man does not grow through pleasure. This Creator knows that in the far off time we, looking back upon what we shall have come through to reach the place of the ceasing of pain, shall be glad of each individual pain that was, remembering all.

Then, of course, opens the deeper question, Why the coming into function of the sleeping nobler elements of consciousness should be

an affair of pain. Is this inevitable law?

It would never have been so if through all these ages we had accustomed ourselves to take sides with the force of evolution instead of with those of inertia and retrogression. It would begin to cease to be so even now if we took sides with our slowly evolving inner nature instead of with that sensual and selfish outer nature against which evolution is done. Nor would even that suffer pain for very long after our desertion; its own sublimation and clarification would presently be pleasant to it.

Perhaps our mind is not yet competent to get any further than this, at any rate to speak intelligibly of what more it sees. But it sees enough to recognize that pain is compatible with beneficence. STUDENT

Diet and Crime

THE Humane officer of a Western city is about to try an interesting dietetic experiment on boy criminals. He thinks that by proper diet they can be reformed. The ordinary diet of civilized life, to say nothing of that supplied in jails and penitentiaries, is, in his view, either in respect of quantity or quality, or both, responsible for as much crime as it undoubtedly is of disease. We are, he says, the best fed and the worst nourished nation on earth; and after the alcohol and morphine habits have been eradicated, we have a larger contract on our hands in getting rid of gluttony.

The anti-crime diet he favors consists of fruit, nuts, and water. It will be administered to criminal men and boys in an experimental home for whose foundation he has secured a tract of ten acres; being accompanied by a properly regulated outdoor life in touch with nature.

We mostly are, but should not be, governed by physical or rather physiological feeling. If the liver is overfull and perhaps generating acids and even ptomaines, we are likely to be irritable, gloomy, morose, or perhaps suicidal. So with the other organs, each in its way. An excessive or half-poisonous diet, throwing the liver out of order, will consequently tend to produce those sorts of feeling with corresponding action. Crime or suicide might result, just as it might from a fragment of bone pressing on the brain.

Real education consists in learning that *self* is not identical with, and can dominate any such feelings whatever — first refusing them expression in words or conduct, and then refusing them entry into the mind. All the steps of such education — which as a whole is Rāja Yoga — are of course greatly aided by a sound body, an unfermenting digestive tract, an unpoisoned liver. And such conditions may usually be obtained under the diet favored by the Humane officer. When to this is added the humanity of his own supervision and the natural life that completes his system, very good results may be expected. The best of them all would be the awakened love of his protégés for their new conditions and the beginning of an awakened consciousness that they were souls and not animals. STUDENT

Archaeology

Palaeontology

Ethnology

Pierres-Plates

THE remains of this gallery form one of the finest specimens now extant of an *allée couverte*. It is 74 feet long, with a sharp bend about midway. On some of the upright stones are remarkable carvings, of which no explanation is at present forthcoming. In the background is seen the village of Locmariaquer, which is said to occupy the site of the Doriorigum of the Romans.

Fire Festivals in France

WHY does fire play such a prominent part in many of the "Pardons" or feasts of the saints in Brittany? At Carnac (Morbihan) is a small mount not far from the famous lines of upright stones, and every year, on the night of the 23rd of June, a great fire is lighted on it. As this little hill is the only eminence in the neighborhood, the flames are seen from a distance, and the fire on St. Michel's Mount, as the hill is called, is the signal for the lighting of scores of other fires. And what a weird sight it is! The flat country towards the sea on one side, and on the other the mysterious rows of solemn-looking granite pillars, with the tower of the village church in the distance pointing to the stars! Archaeologists may be puzzled to account for the origin of the "Lines" of stone, but it presents no difficulty to the Breton peasant, for are they not the petrified remains of a pagan army that was cursed by St. Cornély, the patron saint of the Carnac church, whom they were seeking to slay?

And at the "Pardon" of St. Jean-du-Doigt the bonfire is the outstanding feature, the one that is most eagerly anticipated, and that rouses the people to the greatest enthusiasm. This church is happy in the possession of a finger of St. John the Baptist, which was miraculously preserved from the flames to which the body had been consigned by order of Julian the "Apostate." (Who believes that the liberal and noble Emperor Julian ever countenanced such acts?) To those of only average intelligence it is not easy to see how the relic could get to this out-of-the-way part of the world, but there is of course a legend which easily accounts for it. There is nothing like a legend for disposing of awkward circumstances. Now it is very important indeed that a fire should be lighted at the fête of this saint, for mark you, if there be no fire, no sun will be seen during all the year! So there is a bonfire lighted with pomp and circumstance. Formerly there was even more of dramatic effect in the lighting of the fire than there is today. It used to be so arranged that a Dragon flew down from the tower of the church and it planted a fiery dart in the gathered firewood which caused the flames to as-

cend, and the people to cry out in their joy, "An Tan! An Tan!"

Priests may inscribe the crucifix upon the menhir, and provide the sacred wells and groves with other legends, but it is not easy fully to Christianize the Breton, whatever that process may mean. His ancient worship is as persistent in manifesting itself as is the gorse and the heather in growing in the soil of his very "pagan" country. That charming writer on Brittany, M. Anatole le Braz, who has perhaps caught the spirit of the land better than any other, says that during the night of the 23rd of June, from the highlands in the center to the low-lying coast, there is not a village or hamlet where the inhabitants do not consecrate the symbolic log invoking the sacred flame, or prostrating themselves around the ashes, according to the particular cult they follow.

Through the course of ages the meaning of the various rites has been lost, but forms and gestures remain exactly as they were thousands of years ago.

The fact that these fires are lighted at the time of the Summer Solstice is of course full of significance. In his *Popular Antiquities*, Brand has interesting references to the fire festivals at this time of the year, and thinks, apparently with very good reason, that they are the counterpart of the fire festivals at the time of the Winter Solstice. A wheel, suggestive of the wheel of time, was, he says, common to both. This wheel was wrapped about with straw, taken to the top of a high hill, there set alight, and then started on its way down the slope. This proceeding signified that

the sun, having reached the highest place in the zodiac, was beginning to descend.

An early form of pageant, this, well-calculated to inform the mind of beholders of an important point in the annual journey of the sun, "the King of Stars," as the Breton calls him, through the zodiacal signs. The resemblance between the adventures of the "King of Stars" in his annual journey and the alleged incidents in the lives of the various Saviors has often been urged as ground for supposing that religions are based on astronomical myths; but the teachings of Theosophy now happily show the world that the astronomical is but one aspect only of the story, which has its counterpart in the life of humanity and in the life of the individual, when humanity and the individual are understood as Theosophy reveals them. F. D. UDALL

Two Thousand Years of History

AT Brentford, in Middlesex, (England), a granite monument was erected last May in commemoration of the following events:

B.C. 54.—At the ancient fortified ford, the British tribesmen under Cassivelaunus bravely opposed Julius Caesar on his march to Verulamium.

A.D. 780-1.—Near by, Offa, King of Mercia, with his Queen, the Bishop, and principal officers, held a Council of the Church.

A.D. 1016.—Here Edmund Ironside, King of England, drove Cnut and his defeated Danes across the Thames.

A.D. 1642.—Close by was fought the battle of Brentford between the forces of King Charles I. and the Parliament.

The Fate of the Leaves

HOW much poetic sentiment has been spent upon autumn leaves, falling leaves, sere and yellow leaves! If you could get at the tree's consciousness and talk to it you would still entirely fail to make it understand your sentiment. It does not *lose* its leaves; it deliberately cuts them off as soon as it has no more need of them.

Nor should we spend any sentiment upon the leaf itself; part of it does not die at all; the rest reincarnates.

The green coloring matter of leaves contains a certain amount of a yellow pigment. When the pure green, the chlorophyll, is removed, the yellow remains. This remaining yellow is the occasion of the tears of the poets. The removing of the green is done by the tree itself. It withdraws into its trunk the juices of the leaf cells, their living part — and the green chlorophyll. All that is of immediate value in the leaf, the nitrogen and magnesium, is thus stored, to reappear in another leaf next spring.

Having accomplished this bit of housekeeping the tree now proceeds to cut off the yellow shell. At a certain point in the leaf-stalk a number of small round cells are produced whose duty is to eat through the stalk's fibers at that point. The stalk naturally breaks through with the next puff of wind and the leaf flutters to the ground. The cells now constitute a cap which seals the point at which the stalk broke off. The leaf proper may be said to be still alive within the tree.

Nor is even the dead shell lost. Year after year the bed of them deepens around the roots of the tree; the lower layers decay into organic soil and are thus finally re-assimilated: the tree has lost nothing.

Death, as we conceive it, never happens to anything; it is a mere conception of the bystander, arrived at by considering that which is withdrawn from instead of that which withdraws. It is the withdrawal of *extra* life from that which still retains as much life (at least) as it had before that extra current pulsed in. The leaf's shell *was* carbonic acid gas, water, and nitrogen. The tree seized these ingredients from the air and soil and combined them into the shell.

In part they return to the air, no worse off than before, perhaps in some subtle way the better. In part, in the mold, they stay in organic combination and are as such re-consumed by the tree. Where is the death in the matter?

The ancients symbolized the universe as a tree, arising and growing in eternal space. It lived on "chaos," drawing into itself diffused and formless substance to which it gave form and organization. When it had thus by consuming, organized all, it (as a life) withdrew into the place or condition of absolute life, the richer for its work and experience. The substance returned to the condition of "chaos," but not quite the same as before; it also the better for the organization it had received, the readier to enter into new and higher organization on the next emergence of the life. The life was always straining to realize an ideal,

each time getting nearer. And yet not nearer, for the ideal was absolute. The absolute ideal, and the life straining to it, were the first (or ideal) and the second (or working) Logoi.

But the symbol of the tree had of course other meanings. STUDENT

Radiant Cancer

A REAL step seems to have at last been taken in the study of cancer. The suggestion came from the now well-known fact that x -rays are capable of causing the development of malignant tumors. This fact it is which the Director of the Cancer Research Laboratories of the (London) Middlesex Hospital has followed up for the last three years.

Cancer of course arises under many other conditions. Clay-pipe smoking, prolonged contact with tar and soot, and the chewing of the betel-nut, may also induce it.

The Director explained, in the course of the last "Croonian Lecture," that careful investigation of a number of these common causes had revealed that the materials are all radio-active. Is it in this way that they induce the disease?

It then appeared that the organs most frequently attacked by cancer are often more radio-active than the others; and that the general radio-activity of the tissues becomes greater towards the period of life when cancer is most usual.

The outlines of a theory begin to appear. If x -rays from without will excite a tissue to the development of cancer, may not the same rays generated within the body also do so? Many questions at once open up. If the rays are generated from within, what makes certain organs most susceptible to them? Sometimes injury, we know. Why does not the wearing of certain metals known to be radio-active, for example gold, produce cancer?

At any rate the connexion of radio-activity with degeneration, with breaking down, whether in the case of metals, plants, or the body, seems established. Tissues can be excited to break down by the incidence of x -rays, and conversely when breaking down they radiate the same. But again, the question of the innocuousness, notwithstanding their radiance, of certain metals presents itself. There are evidently x -rays and x -rays, and it is possible that some of them excite construction instead of destruction.

The whole matter is at any rate a refreshing relief from serums, toxins and anti-toxins, and medicine seems inclined to enter upon a worthier and more fruitful path. STUDENT

Bodiless Mass

SOME of the confusions of physics appear to be getting worse rather than better.

What would Newton have said on hearing that a beam of light possesses mass? Not without reason does the new mechanics call itself non-Newtonian. The confusion is worse confounded by the further contention that in this case the mass does not imply body, notwithstanding that the very definition of mass is *quantity of matter*.

When a body emits a beam of parallel light it behaves as a gun does which emits a bullet; it kicks back as it were. The momenta of the outgoing beam and of the back-kicking body are equal, being equal to mass multiplied by velocity. The beam of light has therefore mass, the masses of the light and of the discharging body being respectively inversely as their velocities. The mass of the discharging body is also the less by the quantity of that of the beam. Making out the equations the following result comes into view: That the mass of a body approaches infinity when its velocity approaches that of light. "Hence," says Professor Lewis, "a body moving as fast as light would have infinite mass and infinite energy." Hence also, light is not a body, notwithstanding its mass, since though moving as fast as light it has not infinite mass nor infinite energy. Since, moreover, neither mass nor energy can be greater than their respective infinities, we must not only regard the velocity of light as the highest possible velocity, "but we must so change our present ideas that this shall be the highest conceivable velocity in a material system."

The result which relates mass to velocity has been to some extent experimentally worked out for the electron. Both it and light are somethings possessing mass, but differing in that if the velocity of the former approached that of the latter its mass and energy would approach infinity. The incorporeal massivity of light is certainly something that needs pondering over. STUDENT

Our Alcohol Bill

AT a recent meeting of the American Medical Association, Dr. Nicholl, of the New York Red Cross Hospital reported the results of his study of 30,000 school children, undertaken as part of the general study of alcoholism.

Seventy-eight per cent of them were drinkers, the amount ranging more or less according to age from one glass of beer per week to five glasses a day, one fifth of them, however, using wine and spirits.

Nearly all of these children had drinking parents, a large percentage of the latter being classified as "moderates."

Of the children found to have parents addicted to the use of alcohol, seventy-one per cent are afflicted with functional or organic disorders directly traceable to their inherited weakness from alcoholic parents, and the trail leads even down to the grandchildren.

Begin the estimate by trying to imagine the margin between the amount of good work for themselves and the nation which these children, if healthy, might have done — and that which they will actually do.

Then add the amount of work and money that must be spent by the rest of us in caring for the sick, insane, idiotic, criminal, and prematurely senile.

And finally add the amount of crime into which they will be led by their physical and mental constitution, considering that the whole bill springs from our ignorant or hypocritical use of the word "moderate." STUDENT

THE EXTREME END OF POINT LOMA, FROM THE PACIFIC

Point Loma Forest 300 Years Ago

THE geography department of the Forest Service calls attention to the "Report of the Superintendent of the U. S. Coast Survey for 1858," in which occurs the following:

G.

Next to San Francisco, no harbor on the Pacific Coast of the United States approximates in excellence that of the bay of San Diego. It is easily approached, and a depth of 20 feet can be carried over the bar lying between the southern extremity of Point Loma and the tail of the Zuniga shoal. . . .

Point Loma is the southern part of the western boundary of the bay, and the termination of a remarkable narrow spur of coarse crumbling sandstone rising south of Puerto Falso, or False Bay; and after stretching south for about 5½ miles, gradually increasing in height, terminates very abruptly. It is covered with coarse grass, cacti, wild sage, and low bushes. . . .

The eastern side of the entrance to San Diego bay is low and flat, covered with thick bushes and grass. It is called "The Island," although but a peninsula, being very low and narrow towards the head of the bay. . . .

San Diego bay was discovered by Juan Rodriguez Cabrillo, a Portuguese in the service of Spain, in September, 1542; called Port San Miguel. . . . He found great numbers of Indians here, who received him hospitably, but with cautiousness. It received its present name from Sebastian Vizcanino, who surveyed it in November, 1602.

In his time there existed a forest of tall straight oak and other trees bordering upon the N. W. side of the bay [Point Loma]. This forest was said to be three leagues in length and half a league in breadth, whilst to the northwest of it was a good harbor, now known as Puerto Falso.

Color of Gems Changed by Light

MANY minerals, when exposed to radium radiation or ultra-violet light, undergo a change in color. Kunzite passes from lilac to green under the action of radium; ultra-violet light restores the original color; and the changes can be repeated several times. An experimenter exposed a large number of minerals, borax glass colored with metallic oxides, and ordinary glass, to the action of radium. He also tried heating these substances in oxygen, nitrogen, and other gases. It was found that some were very stable in color, others very readily affected. So-called idiochromatic substances, whose color is due to their chemical composition, were scarcely affected by radium, and were affected by heat only when their chemical composition was changed thereby. But minerals whose color is due to the presence of a foreign substance were easily changed. Among these latter are sapphire, quartz, fluorspar, and most borax and silicate glasses. The arc-light has little effect on minerals in their natural state; but if they have had their color previously changed by radium, it restores the original color. Further experiments showed a good deal of variation in the results produced, according to the particular mineral and the particular treatment. This opens up a new branch of inquiry which may lead to important results in the applied arts. It is of theoretical interest in further illustrating the connexion which seems

to exist between light and the forces that build up matter. The phenomenon of the empurpling of glass when exposed to the air in certain localities finds its explanation along these lines. T.

A Remarkable Stork's Nest

A WRITER in the *London Globe* tells of a stork's nest investigated on the summit of the Cathedral of Colmar in Upper Alsace. It was about thirty years old, measured six feet across and five high, weighed sixteen hundredweight (English) and was such a solid mass that a pickaxe had to be used to break it up. It was made of twigs cemented by clay, and the materials filled 24 sacks. The walls of the nest were found to contain seventeen ladies' black stockings, five fur caps, the sleeve of a white silk blouse, three old shoes, a large piece of leather, and four uniform buttons.

Reclamation in the Sacramento Valley

THE scheme of reclamation being undertaken in the Sacramento Valley has for its object the control of the flow from a watershed of over 4000 square miles and the improvement of the two great rivers of California. Over 600,000 acres of arid land will be brought under irrigation, and large areas of bottom land subject to flooding will be reclaimed. Enough water-power will be acquired to provide electric light and power over most of the Sacramento Valley, 450 miles long.

Students'

Path

THE OPEN ROAD

FOR me the open road over the moor—
Across the ungirdled wilderness, abloom
With flower o' the broom!

For me rich treasure (seeing I am poor
In earthly things) of flowers by hill and plain,
A-glint with silver rain.

I would be free to follow the wind's flight
Where wind and cloud and perfume are all one
With the blessed sun,
To draw to Nature's bosom in the night,
And watch the stars their mirthful dances thread
Through a leaf-bower overhead.

For me the open road that winds all day
Eternally to the sea, where thought is lost
As the foam is tossed
About stark boulders but to pass away,
Like mystic blossoms of the melting snow
That are so swift to go.

Yea, there my soul would stretch its futile wings,
And in my heart a purpose would be born
Of that old scorn

For slavish love, who, knowing heavenly things,
Endures the clamor of the market place,
To serve a thankless race.

Pall Mall Gazette

Is National Decay Avoidable?

THE law of ebb and flow pervades all Nature and is seen to operate in every field of human life. Our health increases and declines in regular successive waves, and in our mental life brightness and dullness alternate. Through all the regions of immensity, from glow-worm to the "variable stars," this periodic rise and fall of vital forces may be traced. In lives of nations the vast surge of cyclic law moves us to awe and wonder as it passes on its way so passionless, impersonal and calm.

A simple tribe of nomad herdsmen multiplies its units and outgrows its borders. Slowly it rises to a climax of efficiency in science and in art, and then descends the downward slope that leads to squalid savagery. While man contents himself with living only in sensation, in emotion, in the lower mind, and does not venture to explore the tideless soul, he needs must be subservient to the intermittent pulses which at first promote the growth of civilized communities and by reaction seemingly beyond control withdraws the stimulus, thus leading to decline.

An equal tendency may be observed in individual lives. The brain of youth expends its scope, the thirst for knowledge deepens, while the great ideals are acquired and nourished in the mind. A glorious flower and fruitage seem to be well upon their way. But toward the middle period of life, the body and the brain, deprived of the propulsive force of youth, slacken their forces, tamely obedient to the ebbing of the tide. Unless

the full-grown man advances to the spiritual levels of experience, forcing his strenuous way into that life which seems at first unreal and unsubstantial because impersonal and vast, he needs must falter and relax his efforts when the full vigor of the body dies away.

When nations reach their culminating point of great control of natural resources and the full tide of progress carries them to the far limit of achievement both in intellectual life and in material success, then comes the hour of trial. The masses of the population have no further aim than to repeat and to intensify the pleasures now at their command. They vainly try to call a halt upon the summit of the hill. They think to hold the current stationary at the flood. Man's puny will is powerless to restrain the action of the cyclic law. The tide ebbs backwards and the forces which impelled the mental and material advance withdraw their stimulus by slow degrees so that the social structure, powerless to resist the falling tides, lapses into decay and final death.

Why should not men resolve to use their temporary vantage ground of confident control of Nature, as a starting-point from which to enter on the path of spiritual life? The physical necessities are easily supplied. No longer is man forced to grinding toil and ill-equipped endeavor to extort the means of livelihood from grudging Nature. The mental leisure which allows him opportunity to take the first initial step of his great enterprise is now at his command.

Whether there ever will be mustered a sufficient band of spiritually-minded men (salt of the earth) to stay the forces of disintegration which set in when civilized society has reached its gorgeous bloom, the future will declare; but here and there already do we meet with individuals in whose eyes glows the bright light of something that defies decrepitude and death; eyes which, as the body's forces wane, burn even brighter than before. Such forceful souls have passed behind the veil of Nature and respond no longer to her fluctuating tides. They enter on the life of Spirit and are free both from the wild excited bursts of frothy zeal and the dull ebb of the reaction when the wave subsides.

Could we but gather a sufficiency of men like this to form the heart of our great body politic we might perhaps prolong the splendid flower for ages. Then might we keep control of our appliances for making Nature serve our physical necessities, but center all our interests in the higher life. We never should be chilled by that satiety which is the portion of the multitude who see no further than the highest crest of civilized achievement and accomplished end. The flush of high endeavor and the limitless unseen inviting our advance would then prevent the deadly slackening of attempt which always follows hard upon a realized ambition, and the tardy consummation of a long desire. Can we not lift our eyes and pierce futurity and get a far off glimpse of a community like that described?

Can we not dimly see a race of spirit-dominated men with a supreme command of civilized appliances and arts but utterly indifferent to their uses save only as they minister to purposes of soul? Were men's minds thus linked on to the true ends of evolution, they would be safe civilized or simple; only as the vision dies do the people perish. STUDENT

Individuality

HAVE the peoples of the earth today attained to true individuality of character? This is the boast of Western Civilization. But on closer consideration, what is individuality? Do we say that a man who has a certain magnetism; who has, in the eyes of the world, always, succeeded, is a man of great individuality? Or is such a man merely one who has abnormally developed his personal will? We are a race of strong personalities, if you choose, but of great individuals, ready to lay down their lives for their country's welfare, no.

Let us explain this distinction thus made between individuality and personality. The former is of the higher, soul nature; the latter of the lower, selfish, grasping nature. The former has regard to the whole of humanity, and its welfare; the latter seeks only for self, and says always, "I, I." True individuality is shown as much in right service as in command.

A man of true and strong individuality is self-reliant. Place him in any situation upon this whole wide earth, and he will immediately lend a shoulder to work that is valuable and noble. He will never attempt to act just like others about him, pretending to be more than he is; nor, on the other hand, will he ever stoop; to such is cant unknown. Try this man in a position of great danger and trust; will he ever become discouraged? No, he has given his word of honor like the knight of old, to stand by his post until death. He has the self-confidence of one who has ever been faithful to his higher nature.

A man of true and strong individuality always adheres closely to his own duty; not in slavish obedience to the directions of another, but sanely recognizing his own powers, in ready obedience to those directions which he knows by intuition are right. What a magnificent thing it is in our days to encounter a man really contented with his own path in life, whether that of the sturdy tiller of the soil, or that of the famous personage before the public gaze who manages yet to maintain a proper dignity.

Think of our modern building, the exemplification of a thousand different styles, and then think of the calm, stately form of the Greek temple. The former is the outcome of intensified personality; the latter is the creation of a true and strong individuality. The one confuses and shatters; the other clears and composes. He who borrows the robes of others displays an ungainly appearance to his neighbor, but he who clothes himself befittingly commands universal respect. STUDENT

We call our "Father in heaven" that deific essence of which we are cognizant within us, in our heart and spiritual consciousness, and which has nothing to do with the anthropomorphic conception we may form of it in our physical brain or its fancy: "Know ye not that ye are the temple of God, and that the spirit of [the absolute] God dwelleth in you?" Yet let no man anthropomorphize that essence in us. Let no Theosophist, if he would hold to divine, not human truth, say that this "God in secret" listens to, or is distinct from either finite man or the infinite essence—for all are one.—H. P. Blavatsky, in *The Key to Theosophy*

MYSELF when young did eagerly frequent
 Doctor and saint, and heard great argument
 About it and about; and evermore
 Came out by the same door wherein I went.

With them the seed of learning did I sow,
 And with mine own hand wrought to make it grow;
 And this was all the harvest that I reaped—
 "I came like water, and like wind I go."

"Into this universe, and why not knowing,
 I came like water, willy nilly flowing;
 And out of it, as wind along the waste,
 I knew not whither, willy nilly blowing."

Up from earth's center through the Seventh Gate
 I rose, and on the Throne of Saturn sate;
 And many a knot unraveled by the way,
 But not the master-knot of human fate.

There was the door to which I found no key,
 There was the veil through which I might not see:
 Some little talk awhile of "Me" and "Thee"
 There was, and then no more of "Thee" and "Me."

Earth could not answer, nor the seas that mourn
 In flowing purple, of their Lord forlorn;
 Nor rolling heaven, with all his signs revealed
 Or hidden in the sleeve of night and morn.

Then to Thee in me, that works behind
 The veil, I lifted up my hands to find
 A lamp amid the darkness, and I heard
 As from without—"The Me within Thee blind."

Fitzgerald's Omar Khayyam

THEOSOPHICAL FORUM

Conducted by J. H. Fussell

Question

Why is it that when an effort is made towards reform, when the spirit of true progress is awakened, the evil and selfish forces are aroused to redoubled vigor?

Answer

You would expect it, would you not? No such effort was ever made, but was the bringing, not of peace, but the sword; and all human upliftment has to be carried over ramparts fully manned and formidable, unstormed these thousands of years.

Each one of us has lived life after life; and in every moment of every one of these we have been laying up stores for ourselves of good and evil and indifference; there have been moments of self-sacrifice and fine endeavor, moments of weakness and treachery, and wasted moments of heedlessness which are the most common of all.

All of these return to us some time; they have become a part of our selves, and are not done with until we have met them again, and transmuted all that was ill in them into good. This opportunity that I have lost now has gone from me, weighted with the inefficiency and idleness I have let slip into it; it will come to me again in its cycle, a little harder to profit by than now; I shall never escape from it until I have seized it and turned it to true value for the universe. Meanwhile the failure will lie hidden within me, amid a vast accretion of other failures.

That which appears of us in any one lifetime is but the smallest fractional part. Consider: you are the result of experience in thousands of ages; how much of all that do you manifest now? You have lived average lives and good lives and bad lives in all historic times and prehistoric times; and much of the ill you have worked must remain to be paid for, as much of your good must still remain to be rewarded. There is all that past

to be sorted out and set in order before you shall stand free and unmanacled for the great service of the world.

Do you remember the man that was shown the barnful of seeds; and he was to separate the wheat and the flax and the oats and the millet, and have them all in their own piles before he could obtain the boon he was seeking? One night he was allowed for the work; an impossibility, as it seemed—if he had had no superhuman helpers.

In all our past lives we have been shoveling seeds in that way into a barn, the good and the evil together; we have kept no count of them; our affairs are thoroughly mixed. The barn is the submerged region of ourselves, and the seeds are our thoughts and actions. Life by life Karma brings forth a few of them into the light; and wheat and tares they grow up around us and we reap them; while we reap, still throwing more seed and confusion into the barn.

Then some time the will comes to us to turn inward, to make straight our lives, to advance; we are content no longer with the old ways of living, but must devote ourselves to better things. Personality has grown too meager, the personal life a bore; we are weary of seeing the confusion and inanity of things as they are, and determine to stake ourselves against this present state of disorder. "I will arise," we say, "and go to my Father"; realizing of what nature has been our food latterly. We desire soul for self, not personality; and to undo some portion of the gross bewilderment and discord of the world.

Then the door is opened of that secret barn that we have been filling all this while; and it is no longer that Karma shall take out a few seeds, good and bad, in a lifetime for our reaping; we must go in, sort them all; be enriched with all the wheat and afflicted with all the tares; according to the strength of our aspiration shall our deserts fall upon us swiftly or slowly. There is no passing on before the work is finished.

We hardly know what it is we have to conquer, when we speak of self-conquest. That which we sometimes call the human elemental, which lives in the body with us; an undrivable and exasperating animal; a pig hankering after every byroad; a mule for stubbornness; a creature of stupendous cunning.

You are feeling as amiable as may be, and no sign nor rumor of him in your consciousness; some duty has to be done promptly, and—there, the brute has tripped you again; you have done everything, but not that duty; he balked and gibbed and was down the bystreet, and yourself in pursuit of him, at the very moment it came to your hand to be done.

You have imposed silence on your personality as to some matter; you stop to bid someone good morning, all sunshine and good nature, nothing less in your thoughts than the pig you are driving, who has been going like an angel all day long. What! There he is between your legs again, and down you go; away he is, racing for the place you set out from; I mean, you have blabbed it all out unawares; the promise you made to yourself of silence is gone to the winds. Whatever is in your mind, be sure that wretched pig is watching; trust him least the more he goes like an angel! If you call your destination Cork, then is his Dublin, and—

Now we come to the region of fairytales; it takes the imagination of the ancients to supply a likeness for what is to happen on the road. The more you have sworn to get to Cork with him, the more you are to find what a thing it is you set out to driving. He was a simple pig at the start; he shall finish up as a raging unsubduable demon (but that you yourself, as a soul, are more unsubduable still). He will undergo more changes than the legends record; you shall battle from sunrise to sunset with dragons; once you have shown him your quality, he is to show you his; and it is to be life and death between you. That is the crux of the thing; it is to be life and death between you; you or your lower self are to survive; the kingdom has been divided against itself; the lower elements are not going under without a struggle. The more your energy threatens them, the more they will fight. They have reserve forces, as you have. Your reserve is the Soul; and the whole divinity of the universe; theirs is the accumulated, unseen, unpaid-for evil of all your lives.

Now what is true of the individual is also true of the race. When any body of people rise up to set things right, and to strive towards wiping out some of the abuses of the world, a challenge is given to all evil; and in proportion to the strength and wisdom of the challengers will be the response. The world may be floating along ever so peacefully, a meek and orderly people ever so careless of any betterment of things, of their lives lived like oxen, of perils to which they have grown accustomed, no longer seeming to threaten. It is easy for the ignorant to be docile, for the unaspiring to be meek. But let some reformer of the true sort arise; let that old peril to the world's enemies, the Theosophical Movement, show its head; let men strive to reach the higher life and proclaim it and induce others to strive for it; and the peace is gone in a moment. There must be fighting then. Where they took only stragglers before, deeming the whole flock safe for them and to be taken at their leisure and pleasure, the wolves must now make invasion in force; their power and livelihood are threatened.

For whatever one shall find within himself, he shall find outside and in the great world also, macrocosm reflecting microcosm. We have a soul in us, which one day rises and will permit no more the old, unhappy dullness and the going in fat, effortless pastures. There is a soul in the race too, whose voice speaks through the great Teachers in their cycles; well for those who listen and obey. And just as there is also a subtle, demon, lower self in each of us, that is accentuated and comes out into the light and wages fiercer battle when we take a stand for the Higher Life, so there is a demon lower self of humanity; and there are men in whom the world's soul is incarnate, and men who embody the world's evil.

We cannot suppose that the Children of Darkness will hold truce with the Light, when the Gods themselves have gloriously broken the truce. This world is the heritage of the Gods, but has been usurped by the demons; let us rejoice when these latter are aroused and rampant. It means that the divine clans are gathered, and that Kurukshetra and Moytura and Camlan are to be fought and won again.

THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY

FOUNDED AT NEW YORK CITY IN 1875 BY H. P. BLAVATSKY, WILLIAM Q. JUDGE AND OTHERS
REORGANIZED IN 1898 BY KATHERINE TINGLEY

C e n t r a l O f f i c e P o i n t L o m a C a l i f o r n i a

The Headquarters of the Society at Point Loma with the buildings and grounds, are no "Community" "Settlement" or "Colony." They form no experiment in Socialism, Communism, or anything of similar nature, but are the Central Executive Office of an international organization where the business of the same is carried on, and where the teachings of Theosophy are being demonstrated. Midway 'twixt East and West, where the rising Sun of Progress and Enlightenment shall one day stand at full meridian, the Headquarters of the Society unite the philosophic Orient with the practical West

Behind the Scenes of History

IN the science of history, as in natural science, we find certain mistakes due to the limitations in the minds of the students.

The world of physical phenomena is a world of effects, whose causes lie invisible beyond. The prescribed sphere of physical science limits it to the study of these effects and bars it from a study of their causes. Therefore we find ourselves obliged to postulate some kind of causes, but prevented from finding the real ones, seeking for causes among the effects, and making a generalization of the effects do duty as a cause; as, for instance, when gravitation is said to be the cause of bodies falling, or force is described as the cause of its own manifestations. These statements, logical if the words are taken to mean invisible potencies, become mere tautology when the words denote a generalization of the effects.

And may it not be so in history? Historians depict for us various movements and tendencies and new spirits sweeping over the people and bringing about changes. But what it is that causes a people, after lying quiet or retrograding for ages, to spring suddenly into new life, is not sufficiently indicated. To what extent are we to regard a new movement as a mere outcome or effect, and to what as a cause?

It is clear that we must postulate the existence of some ever-active always-aspiring spirit in the human breast, which burns with a perpetual fire according to laws of its own, using circumstances as leverage to achieve its ends and as obstacles against which to brace itself. To speak of circumstances as the causes which produce progress is as illogical in history as it is in science. Circumstances *alone* can do nothing, any more than environment alone can cause development in the natural kingdoms. An obstacle is not an obstacle until something resists it; all force is dual; there must be action and reaction. Circumstances produce different effects according to the force that encounters them; one race may succumb to them, another overcome them. We cannot learn much from a study of circumstances alone; we need to know the strength and quality of this innate force that is encountering them.

Some races are rising and progressing,

MEMBERSHIP

in the Universal Brotherhood and Theosophical Society may be either "at large" or in a local Branch. Adhesion to the principle of Universal Brotherhood is the only prerequisite to membership. The Organization represents no particular creed; it is entirely unsectarian, and includes professors of all faiths, only exacting from each member that large toleration of the beliefs of others which he desires them to exhibit towards his own.

Applications for membership in a Branch should be addressed to the local Director; for membership "at large" to G. de Purucker, Membership Secretary, International Theosophical Headquarters, Point Loma, California.

others stagnating or degenerating. Why is this? It cannot be the circumstances; if these were interchanged, the result would be the same. It is something in the race. Or perhaps a race which has been advancing begins to show signs of decaying and succumbing. What is really the matter with it?

To answer such questions we need to know something about the nature of the life-forces within a race and their fount and origin. This means a study of psychology, both individual and collective.

Those whose cast of mind is too practical to allow them easily to remain satisfied with postulating abstractions as causes, will seek to find some definite concrete cause for the effects seen in the historical drama. And reasoning by analogy from the present day, they will infer that the agent in such movements has always been men, actual people, individuals and bodies. A careful study of history would show that for long before any given movement has emerged upon the plane of visibility, it has been brewing in secret. Behind the visible movement in society at large would be found the small group of workers, ahead of their time, courting misconception and resistance. Behind that again would be found the individual, the leader, the prophet. But this machinery, the real cause, usually escapes the notice of the historian; the marionettes are seen, but the almost invisible strings connecting them with the concealed operators are overlooked.

The real clue to history has yet to be recognized. If we could see behind the scenes we should find, throughout the ages, that there have been individuals springing up from time to time, inspired with a message and with unusual energy, who have gathered around them a band of pioneers. This body has been despised and persecuted, and hence has usually worked in secret; but the power of its thought has been so dynamic that it has stamped itself on the race, and its ideas have become the ideas and the inspiration of ensuing generations.

Such leaders are discernible in history, but nearly always strangely dissociated from the events of which they were the real inspirers. Impostors and fanatics they are often called, out of touch with the times. But, since they never worked for reputation, they willingly sacrificed it, yielding to others the credit for which they were not seeking. Those who work for the uplifting of human life have to do so, sooner or later, without recognition or thanks.

To explain the existence of such individuals it is necessary to understand something about human nature and the doctrine of Reincarnation. It is necessary to realize that in other times man has been much more of a conscious director of his own affairs than he is at present. In the present cycle man is not conscious of the source whence his guiding motives spring or of the power that governs his destiny. In his ignorance he imagines a god and sundry theological machinery to fill the gap; or perhaps he is fool enough to think that the mere interplay of human propensities is sufficient to account for the phenomena of history. But a fuller knowledge would reveal to man the causal part of his own nature and initiate him into the mysteries of the World of Causes that lies beyond the World of Effects.

There have never been absent from the world great beings who watch over its destinies during epochs of ignorance and darkness. Unable to work openly, they have been the secret inspirers of the noble movements that have afterwards resulted in visible developments. The awakened individual is the real mover in human life; not abstract forces or ideal Gods.

The Moon Laughed When Adam Fell

ALL creation wept when Adam fell — the sun and stars and all created things.

The moon alone laughed, at which God was very angry and obscured her light. So says an ancient Jewish legend. The influence of the moon is well known, both in its physical and its mental effects. It is connected with the psychic nature of man; hence its classic association with witchcraft and sorcery. The moon is no child of the earth, and a well known astronomer has recently admitted this, having proved it mathematically. T.

Reincarnation

REINCARNATION is a subject which is fast coming to the front in the West, but at present in some quarters the Theosophical teaching is confused with the transmigration of souls. In the "Library of Living Thought," has just been published a volume on *The Transmigration of Souls*, and the London *Telegraph* devotes no less than a column of its space to its review (written by Mr. W. L. Courtney). Obviously, before there can be a transmigration or reincarnation of souls there must be souls to transmigrate or reincarnate, and it is here that the initial difficulty arises in the mind of the reviewer. He is driven to ask the old old question in another form, "If a man die, shall he live again?"

The doctrine, it is admitted, is very widespread, and has been held from the very earliest forms of recorded thought, but how did it arise? Does the theory rest upon those vague feelings of reminiscence we have, when we seem to feel that the experience we are at a certain time passing through has really taken place years before, or has it been derived from the phenomena of dreams "as so many early myths are derived"? Granted that there is a "soul" which is independent of the body, then it can possibly migrate, but if we accept

scientific doctrines, and think that the soul indicates merely our name for the characteristic bodily functions including also the activities of the brain, which a man may exhibit—under a supposition of this kind, of course it is impossible for the soul to migrate, just because it is inseparable from its corporeal envelope.

The reviewer in this manner sums up the situation respecting the existence of the soul at the beginning of the 20th century. It is a position of nescience. Scientists cannot by means of the knife and the microscope and the laboratory find the soul, and so it is fancied that there is no solid ground for supposing that it exists; and so far as religion is concerned, the existence of the soul is entirely a matter of belief. The Society for the Propagation of Christian Knowledge does not seem to have propagated very successfully.

It is to Theosophy that men will have to look for knowledge of the nature of man and his destiny, and it points out the "Path" to tread if one would have the certain knowledge that he is more than his body. The review in question refers to the "soul" in animals and also in plants, as evidenced by the apparent consciousness of the latter, but difficulties of that kind disappear when one remembers that the *universe is embodied consciousness*, and that the "heavenly diapason" ends only fully in man. LONDON STUDENT

The Common-Sense of Evolution

IN *Science* appears a controversy between "philosophic zoologists" and "philosophic palaeontologists," as to whether the variations that occur in animal species are produced fortuitously or purposefully. The philosophic zoologist is quoted as follows:

Whether definite variations are by chance useful, or whether they are purposeful, are the contrasting views of modern speculation. The philosophic zoologist of today has made his choice. He has chosen *undirected* variations as furnishing the materials for natural selection. It gives him a working hypothesis that calls in no unknown agencies; it accords with what he observes in nature; it promises the largest rewards.

The philosophic palaeontologist says that this shows the absolute divorce between the zoological and the palaeontological observer. He thinks the above hypothesis may prove to be a dogma unsupported by facts. He challenges zoologists to produce a single instance of a series of animals in which "adaptive characters are being accumulated through the selection of undirected variations"—defining the word "undirected" as meaning "in which there is no law evident." The philosophic palaeontologist, he says, has also made his choice; and he finds no evidence of such fortuity. To quote him:

The materials for natural selection are furnished by the *ensemble* of an enormous number of characters, each of which is a unit pursuing its independent history and fluctuating and mutating and moving in direct lines under laws which the philosophic palaeontologist has proof of, but totally fails to understand. Consequently he assumes the agnostic position that there is some principle or principles of direction; or, better, . . . "unknown agencies," still to be discovered, other than the principle of order coming out of fortuity.

Here, then, we have two schools, both claiming the facts in support of their opposite theories. The natural conclusion to be drawn, under these circumstances, is that the facts have not had very much to do with the theories; or, to put it otherwise, that each observer's view of the facts was considerably modified by his preconceptions.

The first theory would seem to be that slight variations exist among animals of a species, due to "chance"; that of these varieties, those survive which are best suited to their environment, while the others die. This is familiar theory; and scientists are divided on the question whether or not such variations can be transmitted to offspring. The second theory seems to differ from the first chiefly in giving a different name to the cause of the variations; instead of "chance" we have an "unknown cause." But this unknown cause is considered as being purposeful, while "chance" is not.

Chance, of course, is simply a word used to cover our ignorance. Every effect must have a cause; we use the word "chance" when we cannot trace the cause.

But why is the palaeontologist so puzzled to find a cause for the purposeful actions which he sees in nature, when there is a simple explanation ready to hand? Why not *the mind of the animals themselves*? What else can we conceive of as directing purposeful actions except mind? Every cell in our body has mind; every atom in the universe has mind; everywhere we look we find purposeful action. It is this omnipresent mind that enables the organism to adapt itself to changed conditions. We have the same mind in our own bodies, which will adapt themselves to changed conditions; as, for instance, when a muscle develops after being much used.

The hypothesis that there is mind everywhere explains the facts easily; any other hypothesis requires the predication of unknown forces to supply the place of mind. We first pronounce a thing unintelligent, and then set about seeking a cause for the intelligence which it shows. When we see a man building a house, we infer that he is intelligent; we do not first pronounce him unintelligent and then theorize as to what unknown cause makes him act so. Why is it not the

same in the case of the animal, the organism, the cell? They all act intelligently and purposefully.

The old theory was that Almighty God directed every one of the operations going on in nature. But this sweeping generalization would not satisfy science; yet is not science really creating God over again under different names?

How do bees make honey? Is it not a good enough explanation to say that they have intelligence and have learned how? If we need further explanation, then we must study mind and consciousness. Variation in the animal kingdom is undoubtedly the result of purposeful action on the part of the animal intelligence; though the animal, not being *self-conscious*, acts in obedience to an instinct. In the same way we are not self-conscious of the mind that acts in our own organs and cells; yet there is such a mind—call it automatism or by what name you will. STUDENT

The Churches Day by Day

Can Churches Keep up with the Procession?

IT is interesting to see how theology is striving to show that it is essential to the true progress of humanity, and how difficult a task it seems to find it. A prominent theologian, Rev. P. T. Forsyth, declares, in the *Hibbert Journal*, that the world is trying to prove that the doctrine of Christ is not necessary for the moral emancipation of the race. He thinks, however, that there never was a time when social and personal righteousness found such earnest advocates as now. There is a passion for the reconstruction of our social order in the interest of an ideal righteousness. As private interests are borne down by public justice, so formal religion is on the wane, and with it the membership of the churches. This is accompanied by a turning away from theology.

Abandoning the historical Christ as an effectual factor in modern aspiration, the writer takes his stand on Christ as a "moral fact of the present." The secularist reformers—

have never taken due measure of Christ as a moral fact, still less as a moral factor in history. They have indeed been interested in the historical Christ, and they have owned the spell of his character in the procession of prophets. . . . But they have not dealt as seriously with the moral meaning of the fact as with its moral effect or its aesthetic or historical aspect. They have never integrated him into the moral philosophy of history, into the grand moral psychology, into the spiritual organism of the race—as theology has at least tried to do.

This, and what follows on the same point, is vague, and scarcely calculated to impress the modern hungerer for righteousness as described. This idea of Christ as a moral fact of the present is too shadowy. The proper complement to a historical personality is a modern personality, not a "moral fact."

The main difficulty of the churches is to show where they themselves come in as influential factors in the problem. They are seeking by argument to convince the world of those claims which they have failed to establish by their actions. If they really have any special power to hold up this moral ideal and render it serviceable to humanity, no doubt humanity will find that out and be ready to admit it. But humanity seems to need convincing.

It is of course open for the churches to

say that the movement towards greater social righteousness is too formless and needs the directing and cementing power of a definite belief; but this is just where the churches show their real weakness. For, if they had anything more definite to give, what a golden opportunity would be theirs at the present moment. That they are not seizing this opportunity must be taken as evidence that they are not competent to take it. The maintenance of their existence as churches depends on their assertion of the old time-worn doctrines which the world has outgrown. Many ministers are trying to adopt a position of compromise between, but the old adage about the two stools applies to their case. They do not go far enough for the free-thinkers, and too far for the orthodox.

A Clerical Stockbroker

A PAPER announces the resignation of a pastor from the ministry in order to engage in the business of selling bonds; and adds that he had for some time been carrying on both businesses, on the basis of an agreement with his church directors to be relieved of a part of his ministerial duties. The double harness plan seems to have ended as might have been expected.

On the other hand a clergyman with private means is announced as having decided to devote his private income entirely to charity, and to have sold his automobile and carriage, while he lives on his ecclesiastical revenue. This he does as a true follower of him who had not where to lay his head.

Can Religious Toleration be Overdone?

All men are free to hold what religious views they will, *provided these are not subversive of public order.*—Charter of the First French Republic, Oct. 3, 1789.

No one can accuse the above charter of being too conservative or not radical enough; yet it had to recognize a restriction on toleration.

Toleration is now being lauded in high quarters without a sufficient regard to qualification. There are some things that cannot be tolerated. Sooner or later it will become necessary to define "religion" in order to prevent the abuse of toleration principles and declarations. Cases are often published in which ecclesiastical organizations, claiming a perfect unity and solidarity, have declared that the laws of a state are secondary to the laws of the ecclesiastical organization. Another question is, Can religion be treated as a kind of indifferent pursuit, like fashion in dress, profession, language, etc? It may be so for some natures; but with others it is an affair of the most vital concern. When religion is viewed from the latter standpoint, it becomes a matter of importance what a man's religion is. After studying the views which are promulgated by some religions as being essential parts of their teachings, a wise man would think twice before placing one of their adherents in a position of responsibility.

State-Provided Theology

THE Berlin *Kirchenzeitung* says that there is so much radicalism among the theological teachers appointed by the State to the chairs in the universities, that students often lose faith under the ordeal of teaching, instead of being confirmed in faith. To combat this the church has established vacation courses and

even special institutions to undo the work of the theological professors. This is taken as indicating a growing rift between church and state. It certainly adds a new complexity to the distribution of party lines in religion and politics.

Dogmatism and Enlightenment

PROFESSOR FOSTER, the Baptist minister whose resignation on account of broad views has aroused such interest, is reported as predicting that there will soon be two world-religions: all the Protestant churches will unite with the Romanists against the free thinkers. A union of the other churches with the Roman church will surely be like the union between the wolf and the lamb. But it is certainly true that clericalism is gathering into a focus, as clericalism, not as churches; and that church which is the most clerical will naturally predominate. On the other side are gathering all anti-dogmatic tendencies. It is dogmatism against mental freedom. And on the side of dogmatism we see other things besides clericalism ranging themselves.

All that tends to limit liberty of conscience, whether it be frankly tyrannical or masquerading as a movement for emancipation, belongs to the same category. H. T. E.

'And even Convocations Move'

CONVOCATION, the Convocation of Canterbury of the English Church, has been discussing the Athanasian Creed, as has been already alluded to in this Review. Moved by the spirit of the time it has inspected "the damnatory clauses" with a critical eye.

Upon certain Feast Days the congregations have hitherto been required to express their conviction that whoever does not keep "the Catholic Faith"—which, as expressed in this Creed, consists of a series of incomprehensible propositions—whole and undefiled, "shall without doubt perish everlastingly"; and whoever has done evil shall in due course retire to "everlasting fire."

No one who really accepted these clauses could possibly consent to their being omitted or made optional; it would be far too important that they should be known to every man, woman, and child on earth. But Convocation has consented. The use of the Creed is to be optional; and even when used, the "perish everlastingly" and "everlasting fire" clauses may be omitted.

Even Convocation is therefore moving, however slowly. Perhaps it would hardly relish perceiving that in the front of the same procession of which it occupies the rear is President Eliot, late of Harvard, with his proposition that there should be a new religion altogether. This, he said, will not be bound by dogma or creed.

There will be no supernatural element; it will place no reliance on anything but the laws of nature. Prevention will be the watchword and a skilled surgeon one of its members. The new religion will not teach that character can be changed quickly. It will not deal chiefly with sorrow and death, but with joy and life.

This may or may not be all right; it depends on the significance of the phrase "laws of nature." Philosophically, there can be nothing *super-natural*. Yet there are countless possibilities awaiting recognition by those who become perfected in putting in practice the Wisdom-Religion of Antiquity. H.

Tide-Mills

ALMOST every one has wondered why the rise and fall of the tides is not more used as a source of power, and the answer can only be that there are practical difficulties in the way which render the plan commercially unprofitable. A writer in *The Engineer* (London) considers the question and gives descriptions of some existing tide-mills.

The conclusion arrived at, is that given a suitable natural site, and given a good local market, the tide mill may successfully compete with the coal-fed steam engine and the gas engine as a source of power for generating electricity or for direct driving of a mill; but that without these conditions, it cannot do so.

Old charters show that tidal power was used for grinding corn as early as the 11th century, and tide-mills have been in operation from that time to the present day. In the earlier mills no attempt was made to obtain a head, but the rush of water, both into and out of the pound, was used to drive a paddle wheel. The inflow and outflow could both be used, either by arranging the sluices so that both currents would pass the wheel in the same direction, or by using reverse gearing between the wheel and the machinery. The wheel had to be raised and lowered so as to keep only its lower paddles in the water; but later were introduced paddles which turned on a pivot so as to lie edgewise to the water after completing their stroke, and in this case the whole wheel was sometimes submerged.

In order to avoid an expense out of all proportion to the advantage contemplated, it is essential to have a natural site where a pound can easily be made by erecting a dam across an estuary or other inlet. It is not practicable to arrange matters so that the water can be used both ways. A rise and fall of at least 12 feet is necessary. There must be a local market and an existing road leading to it. Very few situations command all these facilities.

At Woodbridge there is a tide-mill used regularly for grinding corn. The pound covers 310,000 square feet but is very shallow. The average rise and fall is about 12 feet, and the wheel works with a 6-foot fall, operations being begun a little before half-ebb and continued for 5½ hours at spring tides. The wheel is undershot, 14 feet diameter, 6 feet width, with radial wooden floats. Power is transmitted by bevel gearing to a vertical shaft. At St. Osyth the pound is 1,120,000 square feet and there are two wheels, each capable of developing 20 H. P. Seven pairs of stones are driven, and the two periods of running total up to nearly 12 hours at spring tides.

The writer thinks the late improvements in turbines would enable these to be advantageously introduced into these mills in place of the wheels. But after going into figures on the various questions of cost, he comes to the conclusion that tide-mills cannot in general compete with gas and coal, for the main reason that they cannot be had where they are wanted and that it is too expensive to transmit power from where the conditions admit of their erection.

Large sluices are sometimes turbine actuated from the water-head behind them, and water-power is now much employed. T.

Art Music Literature and the Drama

Prehistoric Art in Ireland—Part I

THROUGH storm and strife, through incessant attacks from without and in spite of centuries of internal dissension, the Irish race has ever looked forward hopefully to a good time coming. Today, in defiance of much that is depressing, there is a new life stirring; the people seem almost ready to respond to the regenerating spirit of liberation calling them to awaken to the deeper meaning of the ancient and prophetic title of the land—the Isle of Destiny. What can this wonderful destiny be but a pre-eminence in spiritual life, in the realization and practice of Brotherhood with its accompanying moral and physical blessings, a rebirth of the conditions of the older times when Ireland was in the forefront of European progress, when literature and the arts flourished in a sympathetic and prosperous environment, when the products of Irish looms and workshops, aye, and the learned scholars from the colleges, were called for and held in highest appreciation in foreign lands?

This reincarnation of ancient greatness will be on larger lines than anything yet seen. It does not mean more congested cities with their extremes of wealth and poverty, more soul-killing drudgery for the many and unwholesome luxury for the few; nor the vain pursuit of excitement, falsely called pleasure, which is such a serious blemish on the face of modern civilization. Nor does it imply great military power; the Irish people have never been taunted with pusillanimity in strife, but the valor of the race will be demanded in other fields under the better conditions of the future.

The Irish nation has within its keeping the heredity of a past whose ideals were higher than those of today; it has certain more or less latent qualities of mind and heart which are destined to stand forth prominently in the better times coming when the lessons taught by the suffering of ages will have purged the dross and brought a clearer vision of the real object of living. Strength must not be wasted in lingering mournfully and sentimentally over past glories, which are quite useless unless they inspire the people of today to bring out the best that is lying within them. "There are as good fish in the sea as ever came out of it."

In the record of Ireland's artistic past we find a splendid promise of the future, for the vestiges remaining show the possession by the Celtic people of a high and individual quality in the decorative arts, in music, and in poetry. History may be, and generally is, perverted by

national, theological, and personal prejudices, but the story told by the art treasures cannot be gainsaid. They prove that a high culture prevailed throughout Ireland from very remote periods, for you cannot have a race of skilled craftsmen doing quantities of the highest class of art work without the existence of a public capable of appreciating it.

The object of the articles, of which this is the first, is to give a brief account of some of the most interesting features of Irish art, so that they may be better known and that some hints may be gained as to the lines on which present-day Irish arts and crafts should proceed in order to do the best work in harmony with the spirit of the nation.

low goldfield yielded \$70,000 worth of the precious metal. Sir William Wilde, a good authority, says that a greater number and variety of antique objects of gold have been found in Ireland than in any other country in north-western Europe. Most of them have been discovered deep below the surface of the bogs which cover so much of the low-lying parts of the country. A few have been recovered from tombs or ancient battlegrounds, but most of the golden articles have been found in separate places. The few hoards or collections unearthed are supposed to have been left by plundering Danes who were not able to carry them off after their final expulsion from Ireland. In one stone chamber \$15,000 worth

Lomaland Photo. and Engraving Dept.

PYRAMID OF CAIUS CESTIUS—GATE OF SAN PAOLO, ROME

The public museums in Dublin contain great treasures of antique and medieval jewels and gold, stone and bronze, but only a comparatively few persons can go to see them; most of the Irish and other people in America who are interested in them, have had, until recent years, to depend upon descriptions and photographs for information about the remarkable achievements of the ancient Irish artists, but there is now a wonderful collection of facsimiles of the finest specimens in the Field Columbian Museum, Chicago. The New York Metropolitan Museum of Art last year added a large number of similar reproductions to its collection. These copies are mostly taken from metal work of the early Christian centuries, but there are some which show the high development attained by the native art of working in gold, silver, bronze, and enamel, long before the advent of Christianity.

Gold is still found in several districts in Ireland, but little has been worked since the middle of the last century. In 1795 the Wick-

low goldfield yielded \$70,000 worth of the precious metal. Sir William Wilde, a good authority, says that a greater number and variety of antique objects of gold have been found in Ireland than in any other country in north-western Europe. Most of them have been discovered deep below the surface of the bogs which cover so much of the low-lying parts of the country. A few have been recovered from tombs or ancient battlegrounds, but most of the golden articles have been found in separate places. The few hoards or collections unearthed are supposed to have been left by plundering Danes who were not able to carry them off after their final expulsion from Ireland. In one stone chamber \$15,000 worth

A Literary Mecca of England

THE place to which the lover of English literature will sooner or later turn his steps is Twickenham. No other small town can boast of having been the residence and beloved abode of so many famous literary lights. With it are associated the immortal names of Pope, Horace Walpole, Swift, Gay, Lady Wortley Montagu, Gibbon, Boswell, Johnson, Tennyson and Dickens. Surely this is enough to make any place doubly immortal! Twickenham was well named by Horace Walpole the Baiae, or Tivoli, of England; for it has truly been to London what Baiae was to ancient Rome—indeed, in a far higher degree.

The big red house in Montpelier road where Alfred Tennyson lived for so many years of his earlier married life was the one in which many of his earlier poems were written. . . . That house should surely be sacred to all lovers of English literature, which saw the dawn of *In Memoriam*; which witnessed those delightful gatherings . . . within its walls. It is today called "Tennyson House" and is now without a tenant.—*Westminster Gazette*

The ground may be rough and dirty, or full of rich flowers whose pollen stains and of sweet substances that cling and become attachments—but overhead there is always the free sky.—*Light on the Path*

THE medical journals all note the present appalling mortality from cancer, statistics showing that one woman in every eight past her thirty-fifth year will die of cancer! This, notwithstanding that the profession keeps up an unremitting search for the cause and for a cure of the disease.

Pathologists, who have so far failed to find a cancer germ upon which to put the blame, describe the malignant tumor as a collection of a normal type of cells. Now cells can do two things, but they are able to do only one at a time: they can multiply in number or they can work for the benefit of the body, as the gastric cells do in furnishing digestive fluid, the liver cells bile, etc. The cancer cell does nothing useful, it performs no function; but it consumes nutrition and then goes on dividing, subdividing, and piling up a purposeless, functionless mass which crowds and injures the surrounding tissues. Finally it breaks down and poisons the system with its products of decay.

It may be a long time yet before present lines of research arrive at either the cause or the cure of cancer, and the statistical record, "one woman in every eight," is coming near enough home to concern all women. Leaving the laboratory tests for the profession, it would be well for every woman to test herself by the standard of clean, normal, purposeful living. One need not be a learned physiologist to understand that a healthy body, with an active, contented mind and the forces of nature unselfishly controlled by the will, do not make up the culture medium for any kind of disease germ—malignant or otherwise. Upon the other hand, since every cell is on the telegraphic wire of a live nerve, these units, even in a strong body, will surely show the continued effects of physical or mental disturbance, be it excessive or improper diet, dissipation, fear, jealousy, envy, or any selfish emotion.

Even where there is no special anxiety or

The Cancer Problem and Woman's Work

disturbance, a restless, dissatisfied mental condition is reflected throughout the body by the subconscious telegraphic system of sympathetic nerves and the function of every cell is affected in some way. The balance of the complex

THE BETTER PART

BEYOND the forms and the faces I see ineffable things,

Above the cry of the children I hear the beating of wings;

Gracing the graves of the weary are blossoms that never were blown,

And over the whole of Knowledge stands all that shall yet be known.

The City is not my prison—the world cannot stay me there;

For whole wide earth and beauty there's beauty beyond compare.

The wealth of the wind-blown music, the gold of the sun are mine.

In light of the light men see not—in sight of the things divine.

For truer than all that is written is all that has not been told.

The yet unliving and unliving are truer than all the old. The fairest is still the furthest; the life that has yet to be Holds ever the Past and the Present—itsself the soul of the three.

Elbel Ashton, in The (London) Outlook

processes of nutrition and waste at the fine point of health is lost. When the functional impulse of the cells is not given normal expression and the unexpended impetus is thrown back upon them, as it were, their increased numbers somewhere make for abnormal useless growth. It is significant that in this strenuous, materialistic age, this restless

period of transition, so pregnant with possibilities for the creative and nutritive life forces to find new and worthy expression, cancer is most frequent in the pelvic and digestive organs.

As the racial evolution is at a point where old things are passing away and the awakening soul sense is stimulating both brain and nerves, the body cells become more sensitive. May we not logically relate the impulse of increased activity in the restricted, useless cancer cells to the inco-ordinate, disturbed, restless inner sense of limitation which is found on every hand? Many brilliant women of affairs today are too sane and busy to brood or worry, and yet at times the whole scheme of modern life palls upon them and something within—the truer self—is vaguely and miserably sick for more of the reality. Their trained minds and wide sympathies make them but the more alive to the oppression and cramping misery of the sordid standards of life around them. The outgrowing of old faiths has left many of a negative, sensitive type peculiarly susceptible to social depression and hopelessness.

There is no lack of activity; humanity is strenuously seeking possessions, amusements, education—gratification of all the mental and physical senses and appetites—according to the individual bent. But is not the average life typified by the mass of selfish, useless cancer cells? Are not the majority busy accumulating possessions or acquiring experiences for self-gratification while contributing little or nothing helpful to the real welfare of the human brotherhood of which each man and woman is as much an integral part as the single cell is a part of the body? While the pathologists are absorbed in the study of animal experiments and microscopic specimens, may we not reason by analogy and see the disturbed, self-centered, inadequate quality of modern life reflected through the nervous system into the functionless, multiplying cells

of perverted power and pernicious activity?

H. P. Blavatsky foresaw the danger of this time when, with the passing of old beliefs, the awakening soul sense should impel to activity the minds and bodies of a developing humanity that would turn away from an unsatisfactory theology to seek expression in an unsatisfying materialism. Because the time was ripe, she again brought forward the ancient truths of Theosophy, with its science of right living as a safeguard.

Real satisfaction comes only from service, from a worthy output of energy affording the better part of the nature favorable conditions for its functional expression. Failure to live up to one's higher possibilities produces that intangible feeling of unrest and limitation, that vague longing for a peace and freedom which has been attained somewhere, in some life, and then deserted for some pet license or laziness.

Because life might be richer and fuller today than ever before, Nature demands that we make it so; and she will make us pay the penalty of suffering until we cease to break the law and turn to the natural life. LYDIA ROSS, M. D.

A Queen's Initiative

THE heroic protest made by Queen Victoria of Spain against bull-fighting, which was recently noticed in these columns, seemed at first a futile one. In spite of her appeal to the Spanish veneration for Queen Isabella by showing that Isabella herself had protested against, and fully intended to abolish this sport which has not even the virtue of being Spanish in its origin, Queen Victoria seemed destined to lose in the battle for the cause she had espoused, so much a part of the national life had bull-fighting become. But within the month the tide has turned, due to what many Spaniards believe to be the interposition of Providence, this interposition taking the form of a succession of frightful and alarming casualties. On one day only, in June last, (a Sunday, of course), twelve *toreros* were killed and one injured in Madrid, seven were killed or seriously wounded at Bilbao, several were injured, two fatally, in the rings at Santander and Minola, a *matador* met death in Seville and a *banderillero* was carried dying from the ring at Pantereto.

If this list of casualties were extended to include the families of the victims, with the mental suffering, the anguish of loss, and the deprivation that nearly always, in those classes, follows the death of the breadwinner of the family; if the report could become prophetic as well as historic, so that we could know how many members of these families will in the future, late if not soon, become paupers, to swell the lists of Spain's beggards, a more just idea of the Queen's real beneficence would be gained. As it is, the Minister of

the Interior has now taken legal measures to protect *toreros* from violent death and has also barred from the ring all bulls that have had experience in it, for these soon learn the tricks of *torero* and *matador* and so become trebly dangerous. A wail of protest is being heard from a certain class which declares all enjoyment gone in the sport if it degenerate into a mere killing of animals by *toreros* who are not coquetting with death at every turn. But it is likely to have little effect, for the keynote of humanity has been sounded in high quarters—by the Queen of Spain herself—and with the notable step taken by a Minister of the realm, other steps will follow in logical sequence.

Whether we believe this awakening due to

passed, and "Divine interposition" has quietly shifted the burden to its own shoulders! Even more than the Queen had dreamed of securing so soon has been done already.

There is a divine magic invoked, say what you will, when a pure, strong, heart-appeal is made to the finer forces of life, for those who make it become by the very sincerity and compassion of their invocation co-workers with, even directors of, Universal Law. The nations need more trust in the hearts of their people, not more votes in their ballot-boxes. They need men and women who have that divine courage which will act and act and act in protest, though ruin and defeat may be the only prospect ahead. Particularly do our nations need women who dare to challenge

Lomaland Photo. and Engraving Dept.

MONT-SAINT-MICHEL, FRANCE. N. E. VIEW

"Divine interposition" or not, there can be no doubt, for all history, all philosophy, proclaims its truth, that an earnest protest against evil, for humanity's sake and in the service of right, does awaken an echo in the great Universal Heart of Love and actually shapes and forges events themselves, like fragments of some hero's broken sword, into a weapon of magic power.

No woman has a right to believe that she can do nothing for humanity. What could have been more seemingly hopeless of success than the Queen's crusade against Spain's national pastime? The very fact that she was of foreign birth and training militated against her efforts. Spain itself, by nature and education both, had come to consider this pastime in the light of a necessity. Men high in Spanish councils laughed at the idea of abolishing bull-fighting, the King himself said that he was powerless to render aid, and the English papers commented upon the Queen's crusade as "Quixotic." Yet only a few months have

evil, armored by that superb faith in their own Divinity which can build victories out of the very ether itself. STUDENT

Woman and the Law

THE death in her seventy-second year of Mrs. Burnham Kilgore, of Philadelphia, reopens the earlier pages of America's recent scripts on woman and the law. Mrs. Kilgore was the first woman to be admitted to practice before the Supreme Court of Pennsylvania, and the fourth admitted to practice before the Supreme Court of the United States. When, in 1871, she applied for admission to the Law School of the University of Pennsylvania she was curtly refused, and it required just ten years of siege to batter down the walls of prejudice sufficiently to allow her entrance; but in 1883 she received her diploma as Bachelor of Laws. Mrs. Kilgore was the author of several articles in the *Encyclopaedia Britannica*, and later aided in revising the law terms in *Chambers' Encyclopaedia*. H.

OUR YOUNG FOLK

VERSES ON A DICTIONARY

OH wondrous book, thy leaves unfold
The sum of all that e'er was writ;
Like pearls unstrung, here lie unrolled
The words of Wisdom, Folly, Wit;
Thousands of words, like bells to ring
Their countless changes to the heart,
Then thoughts, their subtle masters, bring
The pen or voice to aid their art.

Here lies the future statesman's speech,
The coming poet's mythic lay
The wisdom that the past should teach
The words that shall the future sway.
And thou, a prophet, shape the speech,
Or gather up the scattered lay;
Show millions how the path to reach
Where Truth and Wisdom lead the way.

Weigh well thy words, choose well thy theme;
Hear soaring Fancy while she sings;
Listen to Reason's thoughtful scheme,
But bolt the page that Folly brings.
Thousands of words before you lie;
Wisdom and Truth you here may view,
But choose with purpose fixed and high
Words that are loving, pure, and true.

Found written on the fly-leaf of an old dictionary, and signed, W. H. N.

Legends of the Rainbow

THERE are many legends connected with that beautiful phenomenon of nature, the rainbow. It is only natural, for does not everyone feel a curious thrill of wonder and delight when gazing at the gorgeous arc of color in the sky? The Hebrew story of the rainbow, how it became the Bow of Promise, is the one best known to us, but there are many other legends, which deserve to be better known.

The ancient Greeks believed that the rainbow was a bridge let down by the gods, and over it was wont to pass Iris, the Swift-footed, on the messages of the gods. To the Scandinavians also, the rainbow was a bridge of the gods. They called it Bifrost, and believed that it stretched from Midgard, the earth, to Asgard, the white city of their gods, and that in the last days of Midgard the bridge would be broken down. It was by Bifrost that the souls of the mighty, slain in battle, crossed into Asgard where Valhalla awaited them. The rainbow-bridge was only seen by mortals when a hero was slain, for then Heimdal, the Warder, sounded his horn for Bifrost to be let down.

The Irish hold that

Where the rainbow strikes the ground,
There the crock of gold is found.

Another pretty Irish legend says that lying buried at the rainbow's foot are a pair of magical slippers, and that whoever seeks and finds them can travel surely and safely to his heart's desire. Again it is said that under the rainbow the earth gives forth an odor of mysterious fragrance.

But not in all of the legends touching the rainbow are there good omens, nor do all tell of its beneficent effect. In Africa there are

tribes who believe that the man who passes under the arch of the rainbow will die a dreadful death, and an English couplet of the sixteenth century runs:

When the rainbow touches the tree,
No caterpillar will hang on the leaves.

Of course the caterpillars are of doubtful benefit, but there is a fairly widespread belief that the rain which falls through the rainbow blights whatever it falls upon.

Many superstitions regarding the weather are connected with the rainbow. We are told thus, "when a perfect rainbow shows only two principal colors, which are generally red and yellow, expect fair weather for several days." Sailors call the rainbow "a sun dog" and an old sea-rhyme runs:

A dog in the morning,
Sailor, take warning;
A dog in the night
Is the sailor's delight.

Although we laughingly quote these weather prognostications, they are sometimes very truthful, and tend to show that our ancestors were close observers of nature; and, with the legends, they reveal the poetical, symbol-seeing mind which belongs to all peoples at certain stages of their growth. H. M.

KEEP your head and heart full of good thoughts and bad ones will find no room. The cup that is full will hold no more.

The Giant and the Law

ONCE upon a time there was a great giant who said he would work for the greatest power in the world. Now, money seemed to be the greatest power, so the giant said, "I will work for money, for one can have everything and do everything when one has money." So the giant worked hard and became very rich.

One day someone who was under the power of evil, stole all the giant's money.

"Well," said the giant, "there is certainly a power greater than money, or my money would not have been stolen." So he stopped working for money and went to work for a number of thieves, and after he had worked for them for some time, he found out that they were afraid of being caught. They said that the law would be after them.

"Well," said the giant, "this law is a greater power than thieving"; so he stopped working for the thieves, but was unable to find whence came the power of the law. Then he began to work for poor people and to help all who were in need. As time went on he found himself growing able to help more and more. He was able to do good in many ways and he began to love his work. The more he loved and helped, the wiser he grew, until at last he found out that he was working under the greatest power on earth. the Law of Brotherhood and Compassion. Then he was satisfied. E.

The Earliest Americans

THOSE who have studied the myths of America tell us that the oldest myths refer to a race of beings who lived on earth and in the country beyond the sky, before man existed. The people on earth at that time are said to have had great power; they had only to wish for something in order to have it; they knew the thoughts of other people; knew when people were coming before they could see them. In time these people came to be divided into two camps: a camp of good persons who originated different kinds of food, arts, games, and religious ceremonies for the race; and a camp of cunning, ferocious people who worked evil for the race.

When the Indians appeared these people had vanished. A part of the good camp and all the evil workers became the beasts, birds, plants, stones, fire, rain, snow, sun, moon, stars, etc.; only a small number of this early people who had prepared the world for man, left the earth. Some myths say they went beyond the sky to the land there; others, that they sailed away over the ocean westward until they were lost to sight beyond the setting sun. There they are said to live now, free from pain, disease, and death. G. R.

UNSKILLED workmen will blame their tools. VALUE a good conscience more than praise. AN honest endeavor is worth ten promises.

THE CHILDREN'S HOUR

The Blackbird and Elsie

"WELL, Elsie," said the blackbird as he walked along towards her as she sat in her little chair under the palm tree one day. "Have you been doing any thinking since I saw you last?"

"Yes, Mr. Blackbird, I have," she said, "I am trying to think why I can't be happy all the time. I wasn't a bit happy yesterday and I am not so very happy today."

"Well," said the bird, "that is bad. What do you think is the reason?"

"I wanted to have a silk dress for my dolly like the one Esther has and Mother said she could not afford it."

"O ho! you *wanted*," said the bird, "that is it. It is because people want all the time that they have not time to be happy with what they *have*. You wouldn't be any happier if you had the silk dress, for then you would have wanted a new dolly, and you would go on and on wanting things."

Elsie opened her eyes and said, "I did not know wanting things made one unhappy. Should I stop wanting and never get anything?"

"Wanting the silk dress has made you unhappy, has it not?" said the blackbird. "It is strange," he went on, "but wanting is a thing which keeps on growing the more you let it. It grows bigger and bigger and never gets satisfied and it has the most to do with making people unhappy, until they can control it and realize that they really do not want everything they see. It is because people want more than they need that so many people cannot have what they need to keep them in food and clothes. It is one reason why people are poor."

"Oh," said Elsie, "I did not know that wanting did that!"

"It is just as I said last time," the bird replied. "You don't know who you are nor what you are here for, or you would not want things because others have them, and make yourself unhappy. You see, you are here to learn what it is that really makes everyone happy and then you will begin to find out who you are. Good bye Elsie; don't think about wanting things for a while and see what will happen," and off he flew and left Elsie thinking hard.

EUGENIA

Three "Samples"

LUCY, Minnie, and Ted were in great delight. They had not seen their cousin for six months, which was a long time in their little lives, and now they were showing him the various improvements and changes that had taken place in his absence. Finally they came to the orchard. The pears were setting into shape small green models of what was to come, the peaches coloring pink, but hard as waxen models yet, while the golden tinted apricots were ripening fast.

"We must not touch them," called Lucy

TWO CUBAN BOYS AT POINT LOMA

THE SONG SPARROW'S TOILET

A SPLASH into a silver brook;
A dainty little dipping;
A dart into a quiet nook,
With all his feathers dripping;
A little shake, a little tweak,
To stir up every feather;
A pretty preening with his beak
To lay them all together;
A stretch of wing, some fluffy shakes;
A flash—he's flown away!
This is how the sparrow makes
His toilet for the day.

Selected

warningly as Ted's fingers closed on a beauty. "Mother wants them for something."

"It would not matter to take one," said the boy giving the tree an irritable shake. "Auntie would never miss it. There it has fallen to the ground! I will have one half and you two little ones can have the other." He stooped and picked up the fruit. Fat little Minnie's eyes were opened wide in astonishment.

"No, no!" she cried, "We must be 'samples,' and 'samples' can't steal."

"I'm not stealing," said Ted hotly, "if Auntie were here she would give it to me."

"She hasn't given it to you," replied Lucy quietly, "and it is greedy to want to eat the first for yourself, anyway."

Ted flushed up for he knew it was the truth.

"Wouldn't you like to be a 'sample' too, Ted," asked little Minnie. "Its helps people when you are." Just then a gentle voice said

softly, "So this is where you are, children," and the little girl's mother gently felt the fruit near her, carefully picking three ripe apricots and placing them on a bed of glossy leaves in the little basket she carried. Ted silently held out his apricot which she placed beside them.

How tempting they looked! "Children," she said, "You may either eat this fruit, or give it to me for Mrs. Thornton who has been very, very ill. But if you give it to me, it must be a willing gift. There are only these four ripe today." She placed an apricot each in the children's hands and turned away down the long path.

"Poor sick lady!" said little Minnie. Lucy's silent decision was made. "Guess it will give her a surprise to see four apricots this size," said Ted firmly.

"We are all samples, Mother," cried little Minnie flying down the path after her mother, and they all arrived together.

So the apricots were sent. Two days afterwards at luncheon time the children tasted their first apricots that season, and truly they were luscious.

"I heard from Mrs. Thornton's sister today, Ted," said his aunt, "and she tells me that the Doctor says that the apricots were the first thing she had eaten for days. She is so grateful to my little people for their gift to her sister."

It was more than Ted could stand and he blurted out the history of his temptation and his cousin's valiant stand.

"You took your chance to make good your past mistakes when it was offered to you, Ted," his aunt replied, "and see how it has helped."

"Ted is a good sample too, isn't he, Mother?" said little Minnie, and Mother smiled.

ETHNE

Boys Who Were in Earnest

NOT long ago two boys were found during the night studying their lessons by the light of a street lamp. Of course the policeman who saw them had to find out why they were on the street at night. They told him, in answer to his questions, that their mother was very ill, that they were nursing her and so were getting very much behind their classes. They did not like to keep their lamp burning for fear it would disturb their mother, and so when she dropped into a quiet sleep they hurried out of the house and started to study their lessons. It is to be hoped that these boys will not have to give up their studies, for they are in earnest. They remind us of the little Chinese boy who was so poor that he could not afford to have a lamp, but who was so fond of study that he would gather a great number of fireflies and hold them in a guaze bag to serve as a light for him to study by, when his other tasks for the day were done. When boys are kind and studious too, like these boys, they deserve to have success in what they do. G.

THE MYSTERIES OF THE HEART DOCTRINE

PREPARED BY
KATHERINE TINGLEY
AND HER PUPILS

The Theosophical Book *of the* Twentieth Century

Tells the story and the history of the Theosophical Movement.

The prices are \$2 in cloth and \$1 in paper, which barely cover the cost, for it is printed and bound, not gaudily, but with such carefulness and thoroughness of art and craft as to make it unique among modern edition books.

ORDER FROM THE
THEOSOPHICAL PUBLISHING CO., POINT LOMA, CAL.

Isis Conservatory of Music OF THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY POINT LOMA, CALIFORNIA

Personal applications and inquiries received every Saturday
by the Secretary at SAN DIEGO BRANCH

ISIS HALL, 1120 FIFTH STREET

between the hours of 9 A. M. and 4 P. M. Full particulars will be sent by mail upon application to

J. H. FUSSELL, SECRETARY AND TREASURER,
ISIS CONSERVATORY OF MUSIC, Point Loma, California

SOME OF THE ERRORS OF CHRISTIAN SCIENCE CRITICISM

BY H. P. BLAVATSKY AND WILLIAM Q. JUDGE

CONTENTS

"The Empty Vessel Makes the Greatest Sound"
A Note of Warning

—by H. P. Blavatsky

Of "Metaphysical Healing"

Affirmations and Denials

The Cure of Diseases

Replanting Diseases for Future Use

—by William Q. Judge

A MOST VALUABLE PAMPHLET. Outside of Theosophy there is given no adequate explanation of the healing that is at times accomplished, nor of its rationale, nor of the ultimate price that must be paid and the dangers connected with such practices.

This pamphlet is invaluable to all students.

Atomic Theories and Occultism

"ATOMIC Theories" is the subject of an article by Professor Louis T. More in the July *Hibbert Journal*, in which the writer, seeming to take for granted that knowledge cannot be reached by metaphysical speculation, announces his conclusion that neither can it be reached by science; and, as he does not mention any method by which knowledge can be reached, this perhaps being outside his subject, the reader is left in doubt as to his views on this point. The effect of thus placing both metaphysics and science may give a handle to religious dogmatism, and supply the churches with an excuse for claiming for their pretensions a value which they have not been able to vindicate. It is important, therefore, to show what is the true way of knowledge, that neither confusion nor false hopes may mislead the unwary.

And the answer is simple. The professor shows, in the course of his article, that modern science when it keeps to its sphere of observing actual phenomena in the sensible world, and using these alone as data for its reasoning, achieves successes in the acquisition of useful knowledge, and is infallible within its limits. It uses the method of actual experience, as opposed to that of speculation. The question then naturally arises, Can the range of this method be enlarged; can we extend the limits of the visible universe; can we apply direct observation to regions of nature that lie beyond the scientific pale?

Theosophy answers, Yes; this is the method of Occultism. As declared by H. P. Blavatsky:

The occultist . . . declares that the daring explorer, who would probe the inmost secrets of Nature, must transcend the narrow limitations of sense, and transfer his consciousness into the region of noumena and the sphere of primal causes. To effect this, he must develop faculties which are absolutely dormant—save in a few rare and exceptional cases—in the constitution of the off-shoots of our present Fifth Root-Race in Europe and America. He can in no other conceivable manner collect the facts on which to base his speculations.—*The Secret Doctrine*, vol I, p. 477.

This touches the root of the matter, and defines the place where Theosophy steps in to complete and round out the thought of the world today. Current thought points out the limitations of ordinary channels of knowledge, and carries us up to the boundaries of the field—there dropping us. It remains for Theosophy to conduct the pilgrim farther. And this it does by affirming the existence of the Science of sciences, Occultism, the data for which are the direct observations of the awakened inner senses, and which is therefore independent alike of speculation and of observation limited to the physical realm.

Hence the writer's statement that "we cannot by reasoning from our consciousness obtain an objective knowledge of natural causes," must be modified, subject to the meaning given to the word *consciousness*; not by reasoning from our present normal waking consciousness perhaps—but how about other planes of consciousness? We may be mocked at this point by a sneer at the words transcendentalism and mysticism; but the subject of higher orders of consciousness and perception obtainable by man as gateways to knowledge cannot be so readily dismissed, in spite of the nonsense, both ancient and modern, that may prevail in connexion therewith.

The professor concludes his article with the words:

Should not the men of science . . . confine their efforts to the legitimate function of science—the discovery of natural phenomena and their classification into general laws derived by logical mathematical processes?

This follows a demonstration that the symbolic theories of science are of a highly metaphysical character, involving great confusion of thought, the mistaking of imagination for reality, and the dogmatizing upon an inadequate basis. This reminds one of the introduction with which H. P. Blavatsky prefaces Part III of the first volume of *The Secret Doctrine*:

So far as Science remains what in the words of Professor Huxley it is, viz., "organized common sense"; so far as its inferences are drawn from accurate premisses—its generalizations resting on a purely inductive basis—every Theosophist and Occultist welcomes respectfully and with due admiration its contributions to the domain of cosmological law. . . . It is only when its more ardent exponents, overstepping the limits of observed phenomena in order to penetrate into the arcana of Being, attempt to wrench the formation of Kosmos and its living Forces from Spirit, and attribute all to blind matter, that the Occultists claim the right to dispute and call in question their theories.—p. 477

The professor next traces historically the developments of the kinematical theory of the universe. With the development of the Cartesian geometry and the calculus had come the possibility of discussing the motions of bodies. By this all problems concerning the paths of moving bodies and their velocities were capable of solution, without the necessity of considering the forces which produced those motions. Lagrange and Laplace generalized this into a law to include and solve all problems relating to a system of bodies in equilibrium and at rest. Their problem may be stated thus:

Given the positions and masses of any system of bodies, to find the configuration of the system at any time previous or afterwards.

By the aid of the principle of centers of inertia each heavenly body could be replaced

by a mathematical point at which the whole mass was concentrated, and endowed with a force of attraction according to Newton's law of gravitation. In the same way every terrestrial body was considered to be composed of small elastic particles, invariable and indivisible, to each of which was ascribed the force of attraction. Thus the whole universe was explained by simple dynamic laws, and Laplace said, "In this system there is no need of a God."

So solidly had this theoretical universe been built, that it defied criticism for a century and established science finally, as it appeared, on a mechanical basis. The other branches of physics . . . fell promptly under the influence of this mechanistic idea. . . . We have the wave theories of light and sound, the dynamic theory of heat, and the mechanical theories of electricity and magnetism. . . . In all these theories, attributes of matter . . . are measured solely in terms of the mechanical units of length, mass, and time. . . . The universe was a complicated machine, whose visible parts were connected together by a system of intangible links called atoms, whose complex motions, while they might defy our analytical skill, were yet completely expressible by general mechanical laws.

Then he says that most scientists now reason as though the atom were a matter of experimental proof rather than metaphysical speculation."

He points out the *reductio ad absurdum* involved in the postulation of an ether to explain the transmission of force from atom to atom, when this ether itself requires a similar explanation to account for its own constitution and properties; it must either be atomic, in which case the reason for postulating it at all disappears; or else continuous, in which case it cannot exhibit the mechanical properties required of it. Thus we have to go on multiplying ethers indefinitely. This has been pointed out by Theosophical literature for thirty years past.

Speaking of the use of hypothetical theories, such as the wave theory of light, and other theories which involve the use of hypothetical bodies like atoms and ethereal vortices, he emphasizes their usefulness when employed strictly as *provisional* theories; but adds:

Their free use tends to confuse the essential differences between hypothesis and fact, between metaphysics and physics, and this confusion does now exist in the minds of the public generally and even in those of many scientists. A desire has, consequently, often shown itself to explain away, or set aside, facts inconsistent with a preconceived hypothesis. . . .

A metaphysical hypothesis, valuable solely for its utility, is always dangerous, for by its constant use we tend inevitably to give an objective reality to things which in the beginning we knew to exist only in our own minds. . . .

Now the belief in the objective reality of molecules, atoms, aethers, and aetherial vortices has grown so steadily that little objection has been made to the creation of a whole new class of objects, called indifferently ions, corpuscles, electrons, or particles, which are assumed to be the constituent elements of the hypothetical atom.

And he compares the remark of a man of science that "we know far more about the aether and the atom than we do about sensible matter," to the remark of a Frankenstein who might say of a mechanical man which he had constructed, "I know more about him than I do about the real man!"

Such confusion of thought is directly traceable to the fact that many scientists have forgotten the distinction between the creations of nature and the

creations of their imaginations. We can never say more of molecules, ions, and the aether, than that they may exist; but ponderable matter, as perceived by the senses, has an objective existence, or else there is no place for science.

Lagrange has proved that any phenomenon which obeys the laws of conservation of energy can be explained by a mechanical theory. But the important point is that *there is an indefinite number of other mechanical theories which will equally meet the case.*

Then is considered the case of Rankine, who, realizing the hypothetical nature of such elements as atoms, etc., sought to frame a satisfactory mechanical formulation by assuming *energy* as a general attribute of matter. He thus chose for his basis something amenable to experimental observation, and was on less unstable ground. But his followers have fallen into the old error and tried to give objective reality to the mathematical equation of energy.

Larmor resolves the molecule into a system of positively and negatively electrified portions in a state of steady orbital motion around each other; a theory in the highest degree metaphysical and artificial, and explaining simplicity by complexity.

The influence of these abstruse and metaphysical theories on scientific thought is already apparent in a certain eagerness to advance startling hypotheses and novel ideas. Many men of science of today have temporarily put aside the sobriety and restraint which should characterize scientific reasoning. The most tremendous results are based on insufficient evidence. . . .

Such confusion of thought and dissolution of the boundaries between fact and fancy is deplorable, and if they create trouble in the minds of scientific men, they have absolutely bewildered the general public. Books of a popular nature are constantly appearing which change the results of speculation into established fact, and their readers naturally credit the most astounding statements.

In conclusion, let it be repeated that Theosophists have no wish to seem to lend themselves to anything which may be taken as discrediting science in favor of religious dogmatism. It is easily possible to make too much fuss about the inaccuracies of scientific research and speculation. One should distinguish between the work of the pioneer and that of the methodizer and plodder who comes after him. Too much addiction to formality and precision will get us nowhere; if we are always to wait until we are quite certain, we would never venture onward. What this professor stigmatizes as wild wanderings of the imagination may sometimes contain flashes of intuition, and sometimes be morbid fallacies. There are both kinds, and discrimination is needed. Anyone writing on a special subject is apt to be carried too far by his enthusiasm for the particular point he is making. But just as naturally as he does this, so does the critic naturally modify, and bring up the other sides of the question.

It is a time of rapid change, and of dissolution, and re-formation in the world of thought. In this ocean of ideas we see many fish, but they are not all sharks nor good herring. We must distinguish. And the great question is, *What is the way of knowledge?* On the one hand we have the blessing of free scientific inquiry; but just as we think it is saving us from dogmatism, some dogmatist tells us that science can never get us anywhere except on the material plane. And if we

turn for consolation to the Occidental religions, we are met with more than equal doubts as to their credentials and efficacy.

In this sea of speculation we can only cling to the rock of solid fact. And we are beginning to realize that the observations of the physical senses, though so reliable in material concerns, cannot afford us the basis of fact we need, upon which to ground our hopes. We must turn to *Occultism, the ancient Science of sciences*, which declares that man can, through self-discipline, acquire the means of direct perception with respect to the world of causes underlying the world of effects; and which points out the means by which alone he can safely and successfully pursue this path. In short, Theosophy is the only beacon by which we can steer in all this chaos.

STUDENT

Right and Left

AN anatomical professor is described as having published an essay on the question of man's righthandedness, in which he agrees with the view that it is due to the preponderance of the left hemisphere of the brain; and this preponderance he attributes in turn to the asymetry of the blood-vessels and other organs of the body. But this is surely about as lucid an explanation as that of the village wag who told the bumpkin that the telegraph posts were meant to hold up the wires, and the wires were to hold up the posts.

Why is man asymmetrical? Why should he be otherwise? may just as well be asked. And, while we are about it, we may as well ask the professor to give us a definition of right and left. Just what does he mean by the right side of the body? If he replies, "That on which the right hand is hung, or that on which the liver lies," this will be reasoning in a circle; and will amount to saying that the liver is on that side of the body on which it is. He might reply that the right side is that which points to the east when man stands on his feet and looks northwards; but then what is the east? The east is that part of the earth which lies to your right hand when you face the north. There is surely something very radical about the difference between right and left and this should be gone into first. E.

Perishable Newspapers

IT is found that the wood-pulp paper, on which newspapers have been printed for the last two decades, is perishable, the files becoming as brittle as dry pine shavings. So not even our paper lasts; we build for the moment, and our civilization will leave few if any traces behind it. It is likely that there have been other civilizations similarly blotted out. Anything worth preserving ought to be printed on durable paper and stored away in a vault; it would not take up much room.

But there is not an indefinite supply of wood for paper. Reliable government statistics, based on local reports and actual measurements, state that the annual consumption of wood in the United States is 23,000,000,000 cubic feet, and the annual growth of the forests only 7,000,000,000. Contrast our perishable records with such as the zodiac in the temple of Denderah, which records the passage of three cycles of precession, a period of nearly 80,000 years, and then boast of modern civilization — if you can. T.

Some Views on XXth Century Problems

Waking Dreams

FOR a short time, when the fame of Carlyle was at its height, his marked and peculiar style proved itself infectious. Young men at the debating societies wrote papers about The Silences, and The Immensities, and cultivated grotesque and uncouth phraseology. But Carlyle was living and no one supposed himself to be possessed by the soul of the sage. Most young men of imagination and ability, saturating themselves with much reading of some strong writer, go through a period of imitation. Their ears are filled with the phrases and their minds with the spirit of the thought of their original. The same occurs with young students of the arts of painting and music.

When we meet with an extreme phenomenon in human life, it is better to wait before making a theory to explain it, until the wonder phase of it has ceased to weight the mind. Then see whether there may not be steps of transition from the normal to this abnormal.

A young man, a goldsmith, has just suddenly taken to painting pictures. He thinks that he is in control of the soul of the dead painter, Robert Swain Gifford. "My hand, but Gifford's soul," he says. Slightly acquainted with Gifford, six months after that artist's death the goldsmith attended an exhibition of his paintings. Whilst looking at them he suddenly thought he heard his voice. Soon after, images of landscapes and so forth began to stream through his mind.

Then out of the mass grows color . . . and (I) gather the intent of Mr. Gifford's plan. Then I paint rapidly under his direction. I know nothing of technique.

Professor Hyslop has examined the case and rendered a report. He thus summarizes:

On any theory we ought to recognize that the identity of Mr. Gifford is clear. . . . The communicator has been and still is influencing Mr. — and influencing him to paint.

Professor Hyslop should know something of psychometry. When a man has been long at work upon a piece of material of any kind, a subtle emanation of his subjective personality remains about it. This stands to his *mind*, as that grosser emanation by which his dog would recognize that he had touched the material, to his *hands* and person. From contacting that material, or even, in the case of a painting, from being in its neighborhood, a very sensitive or mediumistic nature would catch some of the thought or pictures which had been in the worker's mind whilst working.

Knowing now-a-days something of what the "subconscious" is capable of doing, especially when uncontrolled by a strong judgment — and in some people it is nearly as uncontrolled during their waking hours as it is in all of us during sleep — and what a dramatist it is: can we not make a better theory than Professor Hyslop's?

A mediumistic nature is one which is extremely sensitive to those subtler emanations from human life, past and present, and of which one class is the subject-matter of the psychometrist; is of essentially negative temperament, occasionally concealed behind an

acquired sharp and positive manner; is of imperfectly active judgment; and is liable to those incursions from the world of his own subconscious which, when occurring without order, without any deceptive mental fashioning, and in sleep, constitute dreams. For even the most negative nature, when awake, gives an unconscious mental fashioning and plausibility to these incursions.

In a mediumistic or similar nature, then, coupled with the subject's acquaintance with the dead painter, and with his sudden environment by a number of the paintings, we have the materials for a better theory, surely, than Professor Hyslop's. We would recommend him to read Theosophical Manual number 5, *Man After Death*. The soul of a departed painter has something better to do than wearily haunt the neighborhood of his own paint, waiting until somebody mediumistic enough happens to come along. STUDENT

The Meaning of Pain

THE doctrine of pain, just enunciated by Professor George Foster of Chicago, may be at once true and not true. We can never eliminate suffering from the world, he told his divinity students,

for pain and suffering are essential to the advancement of mankind. . . . The only rational solution of the dilemma would seem to be the conclusion that pain has a functional importance. Otherwise how could we believe that the universe is rational?

Professor Foster's faith that the universe is rational means for him that if we could look into the finer work of any sort of pain suffered by anyone, we should see that it was serving to enrich in some way the character of him who suffered, or to teach him something. Here is no reason for not trying to relieve it, for those who pour compassion in thought and act into the world *also* enrich their own characters as well as the characters of all whom the compassion touches — and who, in the end, does any ray of compassion emitted anywhere *not* touch? Nature has these two ways: suffering, which it is *her* business alone to inflict; the relief of it under the influence of compassion, which it is *our* business to supply. This latter is really hers also, at root, whilst also ours; for he who feels compassion has let her soul into him or become a working ray of her soul, Isis. We have no business with the infliction of suffering, for we do not know what mode of it nor what degree of it is applicable to the particular state of evolution of any creature, — *unless* we have gnostically approached very close indeed to the Divine Law and see as it sees.

Pains usually drive us, and always drive the physician, to the search for their cause; for we have an inner absolute faith that somewhere they have a removable cause. When a man has dyspepsia he reforms his ways at table, knowing that he must have broken a physiological law. Having learned to live by that law, his pain vanishes.

But if it be true that man has only learned of some of the profounder laws, and will only learn of the rest, by the pain following the breaking of them, it must also be true that as

he fully learns them the pains will vanish. Subtle forms of *mental* pain may endure long after we have learned so to live that *physical* disease and pain have disappeared; but these too, having had their day, will cease to be.

But before that we shall have learned, and many know it now, that pain and the profoundest joy or peace may co-exist. He has the peace who has felt the Divine Law within him in all its beneficence and transcendent approval of his efforts to live by it; he can stand above his pain, looking down upon it and even glad of its work upon him. This peace and joy is the lot of all who live for humanity, even though, having become too great to be even conscious of their own personal pains, they have fully accepted the pain of humanity.

It may be that when all pain of every kind has absolutely ceased everywhere, the universe as we know it may cease. But that may be the beginning of a real life to which this was but a preliminary and preparation.

So we are justified by a great hope in throwing ourselves upon pain anywhere and working to relieve it. STUDENT

Twentieth Century Degeneracy

WE have recently summarized the report of an investigation into the physical condition of 30,000 New York children. The investigator laid his results at the door of alcohol. The same cause has been adduced to account for even worse conditions prevailing among the children of Chicago, conditions to which we have also called attention. The eyes, for example, are defective in eighty per cent; the ears in sixteen per cent; in twenty per cent there is disease of the nose, mouth, or throat; seventy per cent suffer from anaemia; and so on. The figures are of course much worse for city dwellers than for those who live in the country. Making allowances, we should probably find general conditions to be much like those exciting alarm in other nations. In England, for example, an investigation of 40,000 children in different parts of the country showed that 13 per cent had defective vision, 1 per cent heart disease, 1 per cent lung disease, and 2 per cent some sort of deformity.

In England they are not laying all the blame on alcohol, though its evil is pretty well recognized. The increase in the consumption of alcohol, if any, is in no relation with the increase in physical degeneracy. They recognize the evils of town life, but the degeneration is also in progress among country-bred children.

Miscellaneous marriage of the already unfit or degenerate, think the eugenicists, urging some sort of regulation of marriage as the remedy. But marriage is no more miscellaneous than at any other time; the increase of the unfit remains to be accounted for. Something *increasing* must be sought.

The people to do the seeking are the parents, the physicians, the teachers of schools, and particularly the heads of public boarding schools. There is something in the habits of an enormous percentage of children of all social ranks which needs to be brought fearlessly into the light and dealt with. M. D.

Archaeology

Palaeontology

Ethnology

An Eskimo Sun and Moon Allegory

IN *Scribner's Magazine* there is recounted an Eskimo myth of the Sun and Moon, which may seem strange to those who have no clue to the understanding of myths except that of imagining them to be a kind of dramatization of the phenomena of Nature, but which is readily understood by the light of the interpretations of ancient symbology given by H. P. Blavatsky. Through this interpretation we also see that the Eskimos were not inventing dramas, but that they must have brought down this myth from ancient times and from ancestors skilled in sacred astronomical lore.

For one thing, the Sun is female and the Moon male—a circumstance which surprises the critics. Yet in ancient symbology we often find the Moon, *Deus Lunus*, masculine. Originally it was a sexless symbol; then, after the Fall of Man, it became androgyne; and later still, masculine and feminine alternately. The symbol is so comprehensive that it can be considered as masculine or feminine according to its relation to the other things under consideration at the time. In the same way the Sun has often been considered feminine. Indeed in a modern language we have *der Mond* and *die Sonne*.

The Moon is forever in love with his sister the Sun, and chases her through the heavens, each carrying a lamp, she attended by light, summer and plenty, and he by the long Arctic night, continues the Eskimo myth.

Here we find the allegory of the human soul chasing its divine counterpart. The Moon is a frequent symbol of the changing mind of Man, shining by reflected light and presenting a cold delusive light; in contrast with which is the pure warm radiance of the Sun, symbolizing the light of the Spirit or Higher Intelligence. The chief reason why we know that this is the right way to interpret these astronomical symbols is that we find the self-same symbolism universally, and also the same truths as to Man's nature allegorized in different symbols. But to assume that all the astronomical myths in the world are merely astronomical in their meaning requires too great a stretch of imagination. STUDENT

Herodotus and Memphis

HERODOTUS is generally regarded as a perfectly honest historian, who believed everything that he wrote about, but had unfortunately a capacity for belief greater than the moderns. In view of this estimate of the "Father of History," it is always gratifying to those who have admiration for the ancient historian to come across facts which go to vindicate some of his history; and these are coming to light every year. Londoners and visitors to the Metropolis are favored annually with an exhibition at University College of Egyptian antiquities discovered in the preceding twelve months by the British School of

Lomaland Photo. and Engraving Dept.

THE VIA APPIA NUOVA AND THE AQUEDUCT OF CLAUDIUS, ROME

Archaeology under Professor Flinders Petrie. The exhibitions of this year and last contained a good many extremely interesting little figures of men and women, in terra cotta. Some were of Egyptians and Nubians, others Greek, but there were some representing people who were greater "foreigners." For example, there was a Persian king, a Persian cavalry officer wearing the regimental badge mentioned by Herodotus, and, what are regarded as the most important, a number of Indian figures, "clearly showing that an Indian colony existed at Memphis." Now the existence of a foreign quarter at Memphis is mentioned by Herodotus, and Professor Petrie, having this fact in mind, made his excavations, with the result that he was the first to locate the site. In reply to an inquiry, the Professor kindly sent a note to the present writer, in which he says that he was led to the discovery of the site by the description of Herodotus. Other figures are those of a Spaniard or Sardinian, and a Karian with the helmet crested like a cock's comb, "as named by Herodotus," and many others with peculiar helmets.

The feature of this year's collection, however, is what is described as probably the richest entire burial that has been brought from Egypt. It was found in one of the valleys to the north of the Tombs of the Kings. It is believed to be of the XVII Dynasty. At the side of the coffin lay a basket for toilet objects. In it was a horn enclosed by a decorated plug at the wide end, and with an ivory spout in the form of a bird's beak; a blue marble bowl with four monkeys, whose tails curve round to form the base; a bronze cutting-out knife; a sharpening stone, two flints, and a ball of thread. Inside the coffin was a wooden head-rest (the stem inlaid with ivory and ebony) an obsidian kohl-pot, a basket with

an alabaster vase of ointment, two bead-work pouches, and a bead fly-whisk. At the sides of the coffin were cakes of bread, and a dish of grapes and dates, two stools, and a chair. The jewelry placed with the body included a collar of gold consisting of four strings, each of about four hundred rings, gold ear-rings, four gold armlets, and a girdle of electrum. On the third finger of the left hand was a green scarab with "nofer" and scrolls.

LONDON STUDENT

Modern Inventions Among the Ancients

FALSE hair was worn in Egypt 5000 years before our era, says Professor Waldstein; and he added that in explorations in Greece, he had come across a perfect set of false teeth, made very much on the same plan as our dentists adopt today, and gold-filled, although dating back to the 4th century B. C. In the same country ladies' perfume boxes, containing scents and rouge, have been found. Razors also have been found, those used by the Greeks and Romans being crescent-shaped.

In the south of France there is a concrete arched bridge, known as the Pont du Gard, which was erected in 56 B. C. It is composed of alternate layers of large and small stones, gravel, etc., and of cementitious materials. Vitruvius, says *Cement Age*, describes the materials and methods in use before the Christian era; and other writers accurately describe the ancient method of using boards laid on edge and filling the space between with cement and all sorts of small and large stones mingled together. The ancient builders must have been more conscientious, or better looked after, than some modern ones, or their concrete would not have lasted so long; which shows that conscientious work is the main thing after all.

Our Beverages

THE medical profession has not yet been able to say the final word concerning the relatively innocent stimulants of modern life, tea and coffee. The finer action of these two herbs is still obscure; the recognized verdict is that for some people any dose of them, and for all people an excessive or too frequent dose of them, is bad. The verdict of the philosophers is still to be given, and it would be useful to try to get it.

That they stimulate means that they throw nerve protoplasm into an alertness of function which *should* occur under the pulse of vitality. It does not ordinarily occur because the vitality of few of us is normal.

Since the excitation has been artificially produced, it would seem that it must ultimately die away to a point as much below the usual as it was raised above it. But this equivalent reaction is commonly unnoticed or attributed to ordinary fatigue; whilst the excitation, being immediate, is recognized and sought after.

A newspaper writer has his daily quantum of words to turn out. To help himself he uses tea or coffee, and finally cannot very well make his brain move at the necessary speed without them.

If, upon entering a morning's *physical* work, a man finds that his muscles are sluggish, he puts his will into them, turns the vital current in better stream into them. Under normal circumstances their sluggishness presently departs. He has then gained something by his effort — more will and probably more health; the first of which, at any rate, he would not have gained if he had used some conceivable drug which should do for the muscles what tea and coffee do for the nerves.

Well; should not the writer do for the latter, with his will, what the physical laborer does for his muscles? If he replies that the amount of his work is too great, that his will is not equal to forcing his cells to the work necessary for daily bread, does it not seem probable that the aid of tea and coffee is invoked at the cost of a later breakdown or at least of premature nervous outwear or senility? What to us is now the "normal" period of such outwear is in the view of nature premature by perhaps 40 years — assuming that she would have us live to 120. So it would seem that what *can* be done, with practice, by will, *should* be so done; what cannot, and therefore calls for stimulants, theoretically and ideally should not be attempted — which is a counsel of perfection in these fierce days. But maybe there are fewer situations than we suppose, however arduous, that we could not meet if we lived wisely, reserving from the clutches of excessive appetites that vitality which should be expended in work and in real living.

For the ordinary worker, therefore, whose work is well within his normal powers, or could be made so by use of will, and who wishes to develop will, who wishes to have the power over the protoplasm of his nerves that he is entitled to, these stimulants are philosophically a mistake. What they are physiologically, we leave to the physiologist to ascertain. At present he knows only a dozen or

so of crude facts about their grosser action.

Tea and coffee are related in a certain way to sugar, salt, vinegar, and condiments. All of them are as it were abstractions. They are the qualities which make food agreeable to us, and to which in their natural degree as present in food we have become insensitive. Its natural stimulation, its sweetness, its saltiness, its acidity, its flavors, are insufficient. So we accentuate them with substances that *only* stimulate, are *purely* sweet, purely salt, purely pungent or acid or aromatic or savory. Their presence on our table indicates our inability to respond to the degree of these qualities already sufficiently present in food, to a perfectly healthy organism. And most of them tempt us and enable us to eat too much. M. D.

Some Pathological States

THERE are certain public exhibitions of hypnotism in which the victims are made to perform feats impossible to their normal quantum of muscular strength. A New York medical journal, holding forth on this topic, informs us that they are all of them fraudulent. That one, for example, in which some slim youth lies outstretched with occiput on one chair and heels on another, and the operator jumps up and down on his unsupported body, is explained by the youth being a confederate and wearing a steel harness beneath his clothes.

For many performances that explanation may do very well. But when the journal goes on to say that hypnotism is a purely subjective phenomenon in which no ultra-normal physical expenditure can occur, it merely shows ignorance of the literature. In cases of mania, whether of the nature of delirium tremens or otherwise, almost the entire physical reserves may be expended in a few hours or even minutes; the subject will do feats of strength absolutely beyond his normal possibility and may require five or six strong men to hold him down. The ultimate result is of course bankruptcy and even death.

In the hypnotic state there is sometimes the same liberation of all the reserves; only instead of being expended wildly and objectlessly, the force is run along the channel provided by the suggestion. According to the amount thus expended there is a corresponding exhaustion; where this is very great, death may occur, or prolonged coma. The hypnotic state, in these cases, may be regarded as a regulated mania or epilepsy. Induced often, it leads to the same mental decay as ordinary epilepsy. Induced once, and regarded from the physiological standpoint only, it is probably about as injurious as to be once thoroughly drunk or thoroughly chloroformed. We can therefore cordially agree with the paper named that such exhibitions should be prohibited.

The hypnotic state, often related on the motor side to epilepsy and mania, has relations also with mediumship. Some of the physical phenomena of the mediumistic state are due to the liberation of the medium's reserve energy *beyond* instead of into his muscles, producing some of the cases of apportionment of objects, moving of furniture, and the like. The same

exhaustion follows as in the case of an epileptic or maniacal seizure, and the same mental results — with others — follow frequent repetition.

STUDENT

The Subconscious

PROFESSOR Münsterberg is trying to lead a reaction against the current doctrine of the subconscious. There is no such thing, he says; there are only brain processes remaining latent until called upon, or brain processes so subtle that consciousness does not ordinarily become modified by them.

As a matter of fact the field of the subconscious is vaster than we can possibly imagine. Every cell in the body is in its way possessed of consciousness, memory, and thought. These little flames of consciousness are synthesized into the larger consciousness of the organs; and the synthesis of the organic consciousnesses is the consciousness of the body as a whole. Only an occasional note of this infinitely complex harmony reaches the indwelling man. The subconscious appeals to him when it needs his co-operation, as, for example, in the craving for fresh air or food. All the rest is its own secret. In his turn he calls upon it to do for him what he has not the slightest knowledge how to do for himself; for example, to move a muscle, or wake him at 5.30 tomorrow morning. The healing of a wound or the destruction of bacteria he must leave for it, merely ensuring good external conditions for its work or adding something it may find useful.

If man really knew the measurelessly busy creature with whom he is associated in his own body, he would know some of the profoundest secrets of physical — and even some of divine — nature. But nature knows better than to trust him as yet. She has permitted him a little control over his respiration, for instance; and in this very country there are numbers abusing her confidence by systems of breath-holding, deep-breathing, and what not. What would he not do if she let him play with his heart?

STUDENT

The Winged Egg

WE live, according to the latest word of astronomy, in a winged egg. Mr. Lewis tells us (*Memoirs of the British R. A. S.*, vol. LVI) that this egg, of which we do not (at any rate now) occupy the center is about twice as great in the long diameter as in the short, the latter being perhaps 300 light-years. The wings of the egg are constituted by one or more spirals thrown out from it and twining about it. These coils constitute the Milky Way. On this hypothesis the Milky Way is not therefore a closed ring, nor a pair of rings inclined to each other at a small angle. The spiral is two-branched and makes apparently two turns, of which we see one projected upon the other.

We live, therefore, in a vast nebula still in process of formation and organization around and within its egg-shaped nucleus. We can dimly guess at its future progress from the study of the lesser nebulae and systems within the all-including parent.

A Giant Octopus

THE remains of the largest octopus on record were thrown up on the beach not far from St. Augustine, Florida, recently. They were dead, having been knocked about by storm waves that left only the main trunk of the body. But as this was 21 feet long and 5 feet in diameter, and weighed 6 tons, the tentacles, eight in number, must have been fully 100 feet long. When it was thrown up a scientific man was fortunately on hand to measure it, and a portion is now on view in the Smithsonian Institution.

This monster may be taken as a sample of the denizens of the ocean depths, such as rarely appear on the surface, but are believed to exist in numbers and to form the food of the sperm whales. It shares with the giant squid the honor of supposedly being the celebrated Sea-Serpent; and indeed tentacles 100 feet long might well resemble such a monster. A writer in the *Hartford Times*, who chronicles this discovery, speaks of these creatures as inhabiting "the dark unfathomed caves of ocean"; but this is scarcely what the poet meant when he sang —

Full many a gem of purest ray serene
The dark unfathomed caves of ocean bear.
T.

Instinct and the Animal Mind

WRITING on "Evolution in Nests," *Forest and Stream* mentions that many years ago a naturalist gathered swallows' nests from the window sills and placed them in a museum at Rouen. Forty years later he sought for similar nests and was astonished to find that these showed a real change in their form and arrangements. They were from a new quarter of the city and showed a mixture of the old and new types. Of the forms described by naturalists of earlier periods he found no trace. The new nests were better adapted to the needs of the young.

Here is much food for thought. If this instance is typical, as doubtless it would prove on investigation to be, it shows that we are too hasty if we assert that "instinct" is fixed, unintelligent, and unadaptable. It shows that the birds have a mind, which studies and learns, albeit very slowly; and that so-called instinct is simply the accumulated experience of past generations of birds. And this view is borne out by other observations. Place an animal in unfamiliar circumstances, and it is at first daunted; but close observers have

found that it will gradually adapt itself to the new situation. It is noteworthy here that different observers come to different conclusions according to the thoroughness and patience of their study. One man, holding a brief for the view that animals do not think, notices that the bird which builds its nest to match the color of the lichen on the tree also goes on building nests of the same color on trees which have no lichen; and he argues that the bird is a fool. Yet, if he had watched longer, he might have found that the bird

THE STRONGER CHOICE

NATURE, so far as in her lies,
Imitates God, and turns her face
To every land beneath the skies,
Counts nothing that she meets with base.
But lives and loves in every place;
Fills out the homely quickset-screens,
And makes the purple lilac ripe,
Steps from her airy hill, and greens
The swamp, where humm'd the dropping
snipe,
With moss and braided marish pipe;
And on thy heart a finger lays,
Saying, 'Beat quicker, for the time
Is pleasant, and the woods and ways
Are pleasant, and the beech and lime
Put forth and feel a gladder clime.'
And murmurs of a deeper voice,
Going before to some far shrine,
Teach that sick heart the stronger choice,
Till all thy life one way incline
With one wide Will that closes thine.

Tennyson

Lomaland Photo. and Engraving Dept.

AN ANDES PEAK, WITH "ETERNAL SNOW." ALTITUDE 3900 M.

would gradually correct its mistake. We can hardly expect animals which have grown accustomed to one set of conditions for perhaps thousands of years to change their habits suddenly when the arrival of civilization alters those conditions. It might well take them many generations to adapt themselves.

But there seems no doubt that the so-called fixity of Nature is, in most cases if not all, simply slow change; and that animal instinct is ready to adapt itself if given time.

Another unnecessary view is that of regarding instinct as the work of some mysterious power designated "Nature" or "God." The most natural assumption is that a bird builds a nest by its own intelligence, acquired by infinitely small bits through innumerable generations. But because the bird only knows how to build a nest, get its food, and a few other things which it has learned; and because it does not know how to do other things which it has not learned, we assume that it has no intelligence and we have to invent this term "instinct" to supply the place of mind.

Of course it is presumed that the mind of the animal is transmissible and is added to bit by bit whenever a novel experience renders this necessary. This indicates that man may do a great deal in the way of teaching animals — especially if he sets out with the assumption that they are teachable, and is willing to find them slow pupils.

Finally, we may avoid the apparent necessity of disbelieving ancient writers when their accounts differ from our experiences. H.

Students'

Path

The Larger Science

MUCH has been said and written during the last few years about the increasing tendency to materialism amongst the thinking people of Europe and America. A want of confidence in the teachings on religious questions, which have done duty for two millenniums, has grown up in the public mind, and has evidenced itself in countless ways. One feels that change is in the air on all sides, and it becomes necessary for every man to consider very carefully the principles of ideal and the motives of action which should guide his life.

The ancient teaching that the universe has two main aspects, which mutually interweave and complement each other, is admitted by everyone. The ideas which are presented by the words *spirit and matter*, are the opposite poles of that which contains the whole. The study of the meaning of these two ideas is therefore of the first importance. At present there is much misunderstanding about them. Comparatively few people have taken the trouble to dwell upon them sufficiently to arrive at a clear conception of their essential and polaric difference.

And then the question arises: what is it which enables us to deal with them at all? What is that which constitutes the man himself? the entity or being which ideates, cogitates, seeks, and understands? Evidently this must be something in the man which is able to study not only his body, but all its states, senses, and perceptions, and also everything else in the universe which comes within the grasp of his conscious knowledge. According to the well known teaching of Theosophy, the real man is not any material thing, such as the body in which he dwells. The real man is something very different. H. P. Blavatsky called it "a powerful consciousness."

The argument advanced by some materialistic thinkers, that this consciousness, which is man, results as a by-product of the qualities of the matter of which the body is composed, and that when the body dies the man becomes non-existent, is now relegated to the dust-bin of materialistic thought. The testimony of all ages, the innate intuitions of all peoples, and the positive knowledge of very many who are qualified to know, are against it. Man, the consciousness, does not die with the body. He is a positive and eternal entity and he cannot be conceived of in terms of matter.

If this be so, the question arises: how can he be conceived of? And what is consciousness?

In looking at this question, one is sometimes amazed to find how few people have any idea of the term consciousness. They have not thought about it, or if they have, they have limited its meaning, and have drawn a line somewhere. But if one begins to look

at it fairly, continually enlarging the circumference of one's outlook, the truth of the saying of H. P. Blavatsky, that the "whole universe is nothing but embodied consciousness" begins to dawn upon the thinker. The student of *The Secret Doctrine* will find this explained therein in the fullest measure.

If then we make use of our human self-consciousness, and apply it to the properties of matter, through the imagination of the brain-mind, we arrive at certain conclusions. Firstly let us consider space. We can only image a space of three dimensions. The limits of this image are the mathematical point on the one hand, and the infinitudes beyond the farthest star, on the other. But does this include all experience? Is there not experience of another kind that has no relation to space, or time, or matter? The brain-mind with which we cognize the material world is a limited instrument of consciousness being material only, and with it we can gain but limited conceptions, as a little consideration will convince us. Yet we know that however imperfect our knowledge, there are existences far more real than those which can be expressed in terms of space and matter. Such, for instance, are Truth, Life, Honor.

The ultimate properties of matter are still a mystery and no brain-mind can conceive of them. The limitations which we call extension, have already been referred to. We require some other intelligence to explain gravity, cohesion or chemical valency. We do not even yet know why water may become either ice or steam. We know something of the laws governing these conditions, and that is all. But it is certain that when the last secret of these mysteries of matter is finally understood, it will come through an analogy which man will find in some consciousness which is part of himself. How else could he understand them?

This may be illustrated by the fact that the human tendencies which we designate as material, are specifically those of the lower side of man's conscious nature. The passional, self-seeking, crystallizing forces, the attractions and repulsions, the form-seeking, the burying of latent potentiality, the inertness, are generally recognized as material in their nature. If we can study these and master them, we shall know more about matter than all the microscopes and all the speculations in the world can tell us.

The effects which we call Color, Sound, Heat, and Light, become evident to our consciousness through the sense organs of the body. No one has yet been able to explain these. Science really knows nothing of the causes of them, although theory has been heaped upon theory. That they are not specially material in their nature is evident, since they stand outside the properties of matter as we know them. It is true that they generally become known to us through a material agency, and yet we can instinctively perceive that they have an absolute existence of their own which is of an immaterial nature. They produce effects upon our consciousness but we do not know them for what they are.

If we proceed further we perceive that we have a mind or intelligence which is not limited by the brain. Through it we are able to cognize and estimate the value of the states of consciousness which lie below itself, and also those spiritual states which are above

itself. It can experience and choose. It has a free will of its own. It is, in short, the Ego—the man himself—who is passing through the cycle of experience that he may become ultimately a god, knowing good and evil.

This is the consciousness which extends to things spiritual. This higher, constructive imagination can create for the man that which is already potentially his own. By its means he can consciously assimilate strength, patience, peace, joy, purity, humility, sympathy, compassion. He can become acquainted with the science of the divine attributes—the fruits of the spirit. He does so as the result of study and experience.

The scripture says: "The kingdom of heaven is within you," "The kingdom of heaven must be taken by violence." If these sayings mean anything at all, they mean that the potentiality of attainment lies within the science of human consciousness.

When these facts are rightly understood they throw a flood of light upon the study of ancient religions and of the ancient divine Mysteries. The wise in ancient days knew far more than we do about the divine science. The "gods" of ancient Egypt, India, and Greece, when properly realized, will do much to enlighten a man who is studying to know himself. For these gods were neither more nor less than the states of consciousness which pursue, help, hinder, or transform, the hero-soul of man on his journey towards perfection. Everyone who cares to do so may study this out for himself.

Thus man is a consciousness which is seeking experience by the process of assimilation. The student of *The Secret Doctrine* will find the outlines of the path to this experience on the authority of those who have attained perfection, the Elder Brothers of the human race. We are endowed with discrimination and will to help us in our quest. We learn by experience. We may choose heaven or we may choose hell; but these are far different from the grossly materialistic conceptions with which theology has disfigured them. They are the states of consciousness which are the results of good or evil choice.

What then is the highest state of consciousness which man, as such, is capable of perceiving? Acknowledging with all reverence and humility that our limitations are such that we can hardly approach its borders, we know that we can find no words to convey such a conception even in the barest outline. By our bodily limitations we are confined within the narrowest bounds. None of us can raise our ideals to that center of all from whence came the worlds and the hosts of heaven and hell, visible and invisible. We all know that we are seeking for something. Virtuous and criminal, rich and poor, gentle and simple, there is a force behind us which gives us existence and keeps us moving in this apparently vain search. All, whether they know it or not, are seeking happiness, peace, and joy. In vain we try one scheme after another to obtain it. Life after life we pursue and pursue. Slowly, very slowly, we learn and profit. This struggle is in our very nature. It is the reason why we live.

Where is the goal? It cannot be anything outward and it cannot come from contact with matter, with sense, which is only one pole of the universe.

There is, however, a possible conception of

an attainment which we may term, for want of better words, *The Divine Harmony*. This does not present itself to us as a negative condition of conscious bliss, but as that positive omnipotent, omniscient and dynamic Beness which emanated the worlds and all that they contain. All beings are only partial manifestations of it, and to it they will return when they have found it within themselves.

That harmony is the most powerful force which man can conceive of does not require much proof. Even on the material plane the experiments of Keely demonstrated its titanic energy. But when higher ground is taken and unity of thought, purpose, and ideal are brought into play, its power is obvious. Nothing can withstand it. It is the solver of all difficulties, the royal road to Truth and to the knowledge of Divinity.

The sympathy and compassion which will not rest in peace until all suffering and disharmony is removed, is a part of this divine harmony. Recognizing that he is only a part of the great whole, it is the duty which every man owes to his greater Self, to work for others, that the divine purpose which extends to all may be fulfilled. This is true religion.

The world needs in these days a fuller realization of these Truths. They are written on the sacred pages of the bibles of all races, and they form the substance and essence of the teachings of all the great Saviors of mankind. We need to recognize the reign of Law in this Higher Science. Its unfailing action would unfold itself to our gaze if we would but study it. And then would disappear for ever the absurd and man-made concept of a personal god, and the notion that anyone but himself can raise a man to the knowledge and wisdom which he can only acquire by his own interior effort.

Question

Are pain and suffering necessary to the advancement of our evolution; and if so, why should any effort be made to combat them?

Answer

It would seem that they are necessary, we being what we are. It is hard to say what we should do without them; or rather, it is not hard to say—we should go down into corruption at once. As things stand, pain is the price we pay, not merely for advancement, but for holding our own. Nature, desiring the best of you, sets your face towards gigantic difficulties. She puts the ocean behind you, and the hard rock before; work your way through that, and you shall be saved.

For salvation means nothing vicarious; or unreal; but such actual qualities as courage, invincibility, persistence, which are no holiday blossoms, and do not ripen and fall into one's mouth. There is no safety, except in what we call danger; and we must attain peace armed cap-a-pie, and with flaming swords always drawn. But then consider; the real Self of us is warlike, and courts exertion and activity; we ought to remember that ease is the thing most repugnant to its nature. It insists that all muscles shall be used; and to the muscle grown slothful, use is pain. If our life is a burden to us, it

is because we have grown up in a thousand false ideas, and our whole conception of things is a warped and ghastly distortion. We are these personalities, we imagine; and work is a curse; and we are sensitive to and revolt against pain. What jars against our personal feelings is evil; what chimes in with them is good. That is our bottom-most philosophy, conceal and disguise it how we will. Rubbishing stuff, and unworthy; not even milk for babes, but a sickly and poisonous dilution; how are we to grow up on it, and be men?

Now the fact is, we are two things, all of us: inhabitant and thing inhabited, which latter includes mind and passions, as well as the body of flesh, all that we call personality: the former, the inhabitant, is the soul. The paths of these two are different, and their desires nowise akin. It is not to be thought that we ourselves know anything of pain and suffering, which are rather the obscuration of our true selves; or their sting and objectionableness are. It is personality, the thing we inhabit, that needs the plow and harrow of the Law before it will bear fruit for us; such plowing and harrowing affecting us as pain. It is not the thing itself, but the way in which we accept it, that is the evil.

Think what a congealed, congested, dried-out thing a man is, as a rule. Somewhere at the back of our consciousness, we know ourselves for better things than appear; and it took a deal of slipshod going, to bring us down to this humdrum, uninteresting level. Yet even now there are awakenings and surprises for most of us; there are times when great deeds of self-sacrifice are done, great thoughts laid hold on, and purple and gold and glory flow into our lives. Certainly fountains congealed and hidden are within us, and illimitable magnificent possibilities. Who cannot look back, and see some opportunity neglected, which might have led to the noblest things? But we were fond of ease and self, and afraid of our own greatness; the little things we liked crowded about us, and drowned us away from our proper manhood and godhood. Ought we not to welcome whatever will call us back?

We have so concerned ourselves with the lower nature, as to be forgetful of the divine part of us; and the very word *soul* has come to have a wretched Sunday sound with it, and very little meaning. It ought to mean a universal and glorious thing, alive to the purposes of evolution, and with no anxiety save for furthering the universal plans; a mighty agent, at one with the Law of Laws. To say *I am a Soul*, ought to be the equivalent of saying, *I am divine, without beginning or end, and never to weary of bettering and building up the world*.

These personalities are entrusted to us for their training; they are animal or elemental things, without heroism, without compassion, without wisdom or strength. It is for us to endow them with these qualities, and change them into the nature and likeness of ourselves. Should not pain aid us in our task? We are at one with the Law and the Divine Will; our own eternal volition precludes the possibility of ease and no correction for these unwieldy beasts our personalities. It is shame for us, and our sorrow and degradation, that they should be lacking in the godlike qualities.

Our pain is, when they are at ease in oblivion of divinity; when they graze sluggish in the lush places, and have no aspiration towards the heights. Their pain, that harries and guides them with sharp, faithful teeth, we ought to recognize in a measure as our true servant, and have a certain joy in.

So that these are not the real evils, but what they indicate are the evils, and the necessity for them. It is really within our choice, whether humanity shall go on bleeding and confused under their fangs. They are not set here to trouble us needlessly; but are the result and means of cure for our long ill-doing. We have done so ill so long, that were its fruit to ripen for us unreservedly and at once, the whole world would be plunged into destruction. Too much punishment—which would be about half of what humanity deserves, if one is to go by what is recorded in history—would drive the world into acute madness, and sweep away all our attempts at civilization. So that there is a necessity to hold pain back from humanity, as far as we can; to undo the terrible conditions everywhere, alleviating suffering wherever it may be possible to do so. One's duty to one's own pain is to profit by it, learning strength and endurance; one's duty to the pains of others is to combat them, developing that other and most cardinal quality of the soul, compassion. For pain is the first great enkindler of compassion, and the soul always hopes for a hearing at the sight of pain.

We ought then, to fight the evil of the world with all our power, attacking it mainly at the root, which for us begins in the evil of our own individual natures; in subduing this we acquire a certain power against evil wherever it appears, for we hold no personal property in either good or evil, but draw from a common stock. Most of the philanthropic work in the world is only half useful, because founded on no true knowledge of the connexion between the suffering it attacks, and that which causes suffering, the wrong living which it does not know how to reach or alter. You can postpone human suffering along those lines, no doubt; and that in itself is often worth doing on the sufferer's account, and almost always, as developing latent compassion on the account of him who so postpones it. But to do effectual work one must go deeper, and show men how that suffering ceases, when the causes that set it in motion are no longer at work; and that it is possible to live so that the universe will no longer have reason to oppress you.

REORGANIZED IN 1898 BY KATHERINE TINGLEY

C e n t r a l O f f i c e P o i n t L o m a C a l i f o r n i a

The Headquarters of the Society at Point Loma with the buildings and grounds, are no "Community" "Settlement" or "Colony." They form no experiment in Socialism, Communism, or anything of similar nature, but are the Central Executive Office of an international organization where the business of the same is carried on, and where the teachings of Theosophy are being demonstrated. Midway 'twixt East and West, where the rising Sun of Progress and Enlightenment shall one day stand at full meridian, the Headquarters of the Society unite the philosophic Orient with the practical West

Spiritual and Physical

THE necessity for solidarity is everywhere felt today, at a time when great changes in our material circumstances have at once weakened our hold on the old moral stays and granted us such increased facilities for self-indulgence. But nowhere is this need more urgently felt than in connexion with the rise of the new interest in matters "occult."

Great as is the danger from the selfish use of new discoveries, it is small in comparison with the danger threatened by the misuse of psychism. For this latter is so subtle as to be often beyond the reach of the law, and its effect on the health and morale of the people is far more disastrous.

Under these circumstances it will not be surprising that a body like the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY, whose primary aim is the teaching of humanity, should discountenance all attempts to pursue the study of occultism without the necessary safeguards, and should insist on the culture of unselfishness and purity as the first and indispensable step. Theosophy will not thwart its own objects and abandon its sacred duty by ministering to curiosity, vanity or ambition. The duty of protection is incumbent on Theosophists, nor will they flinch from their efforts to do all that is possible for the protection of the race in its danger.

Man has already suffered enough through allowing the grosser forces of his animal nature to obtain the predominance over his will and intelligence, and through the prostitution of his intellect and other faculties to the service of blind selfishness. To allow his awakening psychic nature, with its subtler forces, to become the servant of the animal, would be to court speedy disaster to civilization, which would necessitate a return to barbarism and a setting back of the hand of progress for ages.

Occultism is not magic. It is comparatively easy to learn the trick of spells and the methods of using the subtler, but still material, forces of physical nature; the powers of the animal soul in man are soon awakened; the forces which his love, his hate, his passion, can call into operation, are readily developed. But this is Black Magic—Sorcery. For it is the motive, and the motive alone, which makes any exercise of power become Black (malignant), or White (beneficent) Magic. It is impossible to employ spiritual forces if there is the slightest tinge of selfishness remaining in the operator. For, un-

MEMBERSHIP

in the Universal Brotherhood and Theosophical Society may be either "at large" or in a local Branch. Adhesion to the principle of Universal Brotherhood is the only prerequisite to membership. The Organization represents no particular creed; it is entirely unsectarian, and includes professors of all faiths, only exacting from each member that large toleration of the beliefs of others which he desires them to exhibit towards his own.

Applications for membership in a Branch should be addressed to the local Director; for membership "at large" to G. de Purucker, Membership Secretary, International Theosophical Headquarters, Point Loma, California.

less the intention is entirely unalloyed, the spiritual will transform itself into the psychic, act on the astral plane, and dire results may be produced by it.—*Practical Occultism*, "Studies in Occultism," Vol. I; by H. P. Blavatsky.

The spiritual and the psychic must be carefully distinguished. A force is not necessarily good because it acts on the astral plane. This is perfectly obvious, for "good" means "uplifting," "ennobling," or "of benefit to humanity," and we can see that such forces may be used for selfish and sensual purposes. Let us take hypnotism as an example: cannot this force be used malefically, or—what also produces dire results—ignorantly? Imagine hypnotism let loose in society as society is today. Imagine, not alone hypnotism, but other powers, stronger and subtler. But we do not have to imagine, when we can see, as we already do in some quarters.

Look around and see the various agencies and influences that seem converging to the point of familiarizing humanity with the existence of psychic powers; some of these influences acting blindly, other perhaps not. Does it not constitute a grave menace to our race, its sanity, its moral integrity, its health?

To counteract all this undermining influence it is essential to insist on the spiritual powers and on the meaning of true Occultism.

True Occultism has for its one purpose the attainment of Sacred Knowledge to be used in the service of Humanity and the cause of Truth and Purity.

The highest morality is the primary condition exacted by Theosophy as a preliminary to Occult teaching. How necessary this is, is seen by the results which ensue from ignoring it. The student loses his way, falls a victim to the delusions created by his quickened passions, and the moral and mental balance are destroyed, causing him to embrace, propagate and defend pernicious doctrines.

We must keep alive in the human heart the aspiration for all that is clean and bright and wholesome. We must maintain the sacred purity of childhood, of the marital bond, and

of every right human institution and relation, such as are threatened by this horrible psychism. All lovers of the true, the pure, the beautiful; all who love sanity and balance, should withstand everything that is neurotic, emotional, erotic, unbalancing. If we value things we must defend them; none but the brave deserve the fair. If we think we

can continue to enjoy the beauties of life in idle indifference, we shall find out our mistake; they are threatened.

We can only escape from the meshes of desire and passion by sacrificing desire and passion; a sacrifice which is no sacrifice.

But Occultism is not merely philanthropy. The great message of Theosophy is that spiritual powers are *realities*, and that he who aspires to use them in the service of the Right shall have them—the ancient message of all the Christs.

How Science Demonstrates Solidarity

ONE instance of the way in which scientific discovery tends to reveal the interdependence of human beings and the consequent necessity for solidarity, is the emphasis that has recently been laid on the fact that persons who are well may be carriers of disease germs. The problems raised by a consideration of this fact touch the whole question of the relationship of man to man. When it is asked what we shall do with these unailing individuals who are a constant danger to their fellows, we find that the familiar standards that have hitherto dictated our policy in such matters are no longer adequate.

A writer in the *Boston Transcript* points out that the report of a recent outbreak of diphtheria in an institution was false, being due merely to the fact that the physicians had discovered diphtheria germs in the throats of a large number of well people. But in removing one scare, we create another; for this is by no means unusual, but in fact the rule. Such persons, designated "carriers," are people who, though well themselves, on account of their constitutional strength or immunity, yet are creators and distributors of disease germs. It seems indubitable, from what is stated, that there are many such persons, creators and distributors, not only of diphtheric, but of tuberculous and other germs. And these germs are liable at any time to pass

from the quiescent to the virulent state, thus causing the disease to break out in the carrier; or they may, though quiescent in him, assume the virulent state when communicated to somebody else.

After giving figures to show the prevalence of carriership, the writer asks what we are to do with the carrier? This is a difficult question; because first we have to discover him, which cannot be done unless we examine everybody; and next, when discovered, it is hardly practicable to seclude for an indefinite number of years an individual who is to all recognized intents as well as anybody else. He will not submit to the treatment, especially when he knows that he is no worse than many who are permitted to go at large.

This brings home to us the fact of our mutual dependence and the need for solidarity. It is not merely that we recognize the danger better; it is that the danger actually is greater than formerly, on account of the increased intimacy and more widespread intercommunication brought about by science. We must level up our ways of living into conformity with the changes introduced by science; our conduct must be altered to suit our altered circumstances. Otherwise our society is threatened with many dangers.

But the need for solidarity is emphasized in another way by the same problem. We have seen how difficult it is to provide precautions against the spread of contagion by well persons. Is not the reason for this difficulty to be found in the fact that we have not enough solidarity to be able to act effectually in concert, to be able to pool our knowledge, to be able to appoint and obey a recognized authority? Any authority which ventures to assume the direction of the community in such important matters must be able to establish to the general satisfaction its *fitness* to act in that capacity. It must be able to command the public confidence; for it will never, unless by unexampled tyranny, command their blind obedience. And before such an authority can emerge, we must have attained to a solidarity in our beliefs and sentiments such as we see no signs of at present. Nevertheless the goal is definite; solidarity is seen to be the essential law of human life, from whatever point of view we examine life.

Religion Day by Day

Church Provides an Arctic Hell for Alaskans

THE following interesting episode is quoted in the *Literary Digest* from a book on the natives of Alaska by a Russian missionary of the Greek Church:

A missionary was constantly threatening his impenitent converts with the flames of hell. But he noticed that this threat, instead of filling them with terror, was exceedingly agreeable to them, for the thought of being warm in the next world filled them with joy. The missionary made a complaint on this point to the bishop, who understood at once that a Northern hell must be represented differently. He therefore told the missionary to teach his people to expect a hell of frost, where the cold is ten times as intense as upon earth. This freezing Gehenna terrorized them, and the refractory ones were soon reduced to obedience.

This anecdote throws serious doubts on the question of the missionary's and the bishop's belief in their own teachings. They appear to have regarded the doctrine of hell-fire as a story invented for the purpose of reducing

sinner to obedience. Surely it would never do to let the story reach the ears of penitents in the temperate regions of the church's authority. Or is it possible that the penitents regarded the ecclesiastical authorities as a kind of magicians able to doom them to suffering after death? In any case the anecdote is not very creditable to the reputation of church doctrines.

The Christ of Promise

IN a brief mention of a book called, *The Christ of Promise in Homer, Hesiod, Virgil, Ovid, Horace, etc.*, we read that the author seeks to show by many excerpts from these classics that the story of Christ has been told for a much longer period than is popularly supposed, and that Paganism was never universal among Gentiles between Noah and Augustine.

Now let us imagine a learned Hindû pundit or a great Chinese scholar commenting on the above. What would our Jewish Biblical traditions and our Greek and Latin scholarship be to him?

It is creditable, of course, to have enlarged one's view as much as is indicated in the above title, but how much longer are we to be dominated by Hebraic traditions and the twisting of the Graeco-Roman classics?

Are we to suppose that all those authors, from Homer downwards, were alluding to the particular Jesus of our own borrowed theology? The *Christ of Promise* is a universal belief, and refers (1) to the dawning of the Self-Knowledge in man; and (2) to the periodic appearance among men of epochal Teachers. At all times men have felt that periods of spiritual enlightenment would come and that they would be marked by the appearance of great spiritual Teachers.

The coming of the Christ in the first of the two senses mentioned, is an event that may occur to any man in the history of his Soul's pilgrimage. It means his arrival at the state of Self-Knowledge, when he becomes freed from the delusions consequent upon ignorance of the true Self, and is "reborn" in spiritual knowledge. In the second sense, history shows us the records of a continuous succession of great Teachers among all nations; men ahead of the generality in their evolution, coming at times of darkness to instruct and help humanity.

President Eliot's New Religion

PRESIDENT ELIOT'S prophesied new religion has been too widely reported and commented on to make it necessary to consider it at length here; but one or two points may be considered. He says that the new religion will have no place for obscure dogmas or mystery, and will admit no sacraments except natural hallowed customs, and it will deal with natural interpretations of such rites. Also it will comprehend only persons of good will.

It would seem that the President has made his subject too formless and too forceless. Negative virtues will not withstand positive vices. The human passions are strong, and will lead unless they are led. A body of amiable people with indeterminate views cannot dictate to people of purpose and conviction. Religions have always started from great enthusiasm and conviction, definiteness of purpose, and (above all) leadership. The reason why our present religions are not succeeding is that there are virtually no men of light and

leading in any pre-eminent degree. There may be able and clever men, but no men of such marked spiritual pre-eminence that they can claim authority on their merits.

The world has had plenty of theories and claims. Instead of having people who carry lanterns and say, "Here, follow me, I can show you the way," it needs people who will open the shutters and *let in the daylight* so that people can *see the way for themselves*. A new religion will not drop from heaven into our expectant laps nor generate itself out of our praiseworthy hopes. There has never yet been a religion founded without a leader; and if the new religion is to be anything more than a temporary agitation the leader must be one whose qualities will command the attention of the world without his having to put forward any pretensions. In fine, he must be a *real* leader.

Amiable men and women will not make a new religion. There must be men and women of character and conviction. And they must be profoundly versed in that greatest of all studies, the study of man. The new religion will be grounded on a proper knowledge of the mysteries of man's nature. This does not mean mere theories or dogmas about it, but definite knowledge, founded on experience.

Our present religions cannot initiate us into anything; they can only give us good advice. The new religion will have to be able to initiate people into something or it will command no attention. People will not pay much respect to a mere body of good-intentioned people humbly seeking for the light. They want people who can show them something real. Hence we must look for the emergence of a new religion, if there is to be such, among people who have definite knowledge to impart and who can make their words of some effect; people who can and do actually teach and help and bring light, not people who merely proclaim new theories.

Where can such positive and age-old teachings be found outside of Theosophy?

Minister Assails Churches

A MINISTER, who is reported as having recently "stirred up things at a Christian convention," spoke strongly on the uselessness of the denominations in face of social needs, and pleaded for a union of all Christian churches on the basis of essential Christianity, which he said consisted in two things:

A Social Message, and
Personal Piety.

Two things which he said are worthy of special mention. One is the forcible figure of rhetoric in which he conveys the contrast between the church's lofty ideals and its trifling practices:

To put in bath tubs and horizontal bars will not solve the real problems of the church.

The other is where he represents the church as voting with the good old parties to please the deacons, but talking to the socialists in the parlor.

A school must have two things: teachers, and something to teach. Without these they cannot ask the people to come to them. The churches are realizing that they scarcely have these essentials, and that this is the real reason why the people drive by their doors. The people want tuition.

But will the message come from the

churches, or the people of piety appear in the pulpit? It was not so in the days of Jesus, when he condemned the churches of those times, as quoted by the minister. The Christian churches, as such, are no longer in the van, but in the rear; they are following, not leading. How can we lead the people whither they want to go? is the burden of their cry. The attitude is illogical. Some, no doubt, would have the column face round and march back under the leadership of the rear ranks, and this attitude is more logical; but fortunately the people will not do it.

There does not seem much use in ministers who feel as this one does staying in the church; they can never make its organization subservient to their views. They could be better teachers outside of it.

To become a spiritual teacher it is necessary to have studied one's own nature and to have acquired some mastery over it greater than that possessed by the average man. But the churches do not seem to have the Gnosis, but merely dead dogmas. What has become of the esoteric teachings of Jesus? H. T. E..

The Awakening of the East

THE newspapers of China, says the *Literary Digest*, have only recently become "live," reflecting the opinions of the people and giving them material for their opinions. The new press is rousing the masses from their indifference to political questions, says a Chinese editor, writing in a London magazine; it freely criticises the abuses and arbitrary conduct of the officials and spreads a knowledge of European institutions and of the possibilities of China. This is quite a change from the old-fashioned official newspaper. Weeklies and monthlies, of a more or less literary character, are also being developed; while a comic paper exercises the Chinese talent for irony.

This awakening of the East does not play a sufficient part in the forecasts and anticipations which people make for the future of our civilization. We cannot afford to omit so important a factor from the equation. Is it a light thing that a nation of such vast size and remarkable national solidarity should be adopting Western methods? Knowing, as we do, what the press can effect, we must completely invert our estimate of China's value as a factor in the world's affairs; just as in algebra the larger a negative quantity is, the larger it becomes when the sign is altered to positive. And other Eastern countries the same. It seems as if, after this has gone on for a few years more, the influence of Eastern thought will have become so great as to affect all our problems, political, social, religious, commercial, and what not.

And the Orient does not put on western civilization over a naked skin, as we may be said to have done, but over a profound conservatism and adherence to ancient ideas. The amount of stored-up *character* in China is something inconceivable. Its capacity for absorbing and assimilating the races that have "conquered" it from time to time is well known. And this reflection raises an "awful question."

Can it be that, without knowing it, we have gone and "conquered" China — not with the sword this time, but with modern weapons? If so, will China proceed tranquilly to digest us, and does this news about the papers and

so on indicate that the process has already begun? How long will it be before the British Parliament wears queues and orates in Chinese? These are awful questions, but they are far from ridiculous in view of the facts.

The survival of the fittest; the predominance of the big-brained; nature's rigid justice;—and finally the engineer hoist with his own petard, and the modern scientific phrase-monger hoist with his own phrases! All very well, these phrases, when *we* happen to be the fittest; but suppose the case were reversed? Then it would be a chance for the philosopher to evince the courage of opinions and meekly go to the wall or to the hindmost.

Rolling down hill may be pleasant while it lasts, but is apt to have consequences. And may not some of our philosophies be described as rolling down hill? It is force of character that wins the day; and if there are any who do not wish to become a portion of the future Chinese empire, they had better develop a force of character that will keep them from that destiny. Is trade our boast?

TO THE MUSES

WHETHER on Ida's shady brow,
Or in the chambers of the East,
The chambers of the Sun, that now
From ancient melody have ceas'd;
Whether in Heav'n ye wander fair,
Or the green corners of the earth,
Or the blue regions of the air,
Where the melodious winds have birth;
Whether on crystal rocks ye rove,
Beneath the bosom of the sea,
Wandering in many a coral grove,
Fair Nine, forsaking Poetry;
How have you left the ancient love
That bards of old enjoyed in you!
The languid strings do scarcely move,
The sound is forced, the notes are few!
William Blake (Selected)

Then how indeed can we hope to compete with a thoroughly westernized Chinese people, equipped with all modern inventions? If trade is to rule the world, are we likely to be the rulers?

The press supplies plenty of material for answering this question. Orientals can drive our workers from the labor market. The very principles on which our commercialized civilization is founded make it right, according to those principles, that the employer should employ the cheapest labor he can get. Then the Orientals are taking to manufacturing goods themselves instead of importing them.

We are building railroads, ostensibly to carry us and our goods and influence to the East; but railroads run two ways, and no doubt the Bagdad railway and others will serve equally well to carry Orientals to the West.

This awakening of the East is indeed a challenge to the West. Has Jack been playing while the giant slept? We had better make up our minds whether we cannot learn a few things from the East in return for what we have been teaching it.

The Eastern peoples are far older than we, and they have preserved an idea as to what are the essential factors of life. Our own ideas of reliance upon material resources and personal ambition seem to them to be imper-

manent ideals which they have long since outgrown. They place their reliance on certain qualities of character in the people, and we shall have to set about studying character and the mysteries of human nature in order to get a permanent basis for our civilization. If we continue to rely upon superficial forces we shall become a mere adjunct of Oriental civilization.
H. T. EDGE

Is Mass Permanent?

WE learn from an article in *Die Umschau* (translated in the *Scientific American Supplement*) that:

The law of the indestructibility of matter (or the conservation of mass) forms the very foundation stone of modern chemistry.

Anaxagoras, Aristotle, Empedokles and Demokritos affirmed it; Lavoisier re-affirmed it.

No attempt was made to test rigorously the truth of the law. In every chemical reaction its truth was so plainly evident that it seemed unnecessary to ask for further proof.

Nevertheless, in connexion with experiments requiring great accuracy, the question of its absolute truth has been raised. Stas found that in the synthesis of silver bromide and iodine, the mass of the product always fell a few milligrams below that of the constituents.

But as our faith in the security of edifices depends on an accurate knowledge of the movements of foundation stones, Kreichgauer made actual experiments to determine to what extent this law was a dogma, and was followed by other investigators. By the most elaborately careful experiments with reagents in sealed glass tubes and specially constructed balances of greatest delicacy, it was found that there was always a loss of weight. Staunch to their law, however, the experimenters found themselves unable to resist the conclusion that some of the ingredients must have gotten out through the glass. So they placed silver foil outside the glass vessels to catch any metallic vapors that might diffuse through; and they did catch them and tested them qualitatively, and quantitatively.

So the law of the conservation of mass is not necessarily disproved. Whether it was actually refuted depends on whether or not the amount that oozed through was equal to the amount lost from the tube, and on this we are not definitely informed. The point is whether mass remains a constant quantity throughout the whole of a chemical reaction. And let it be observed that even if it does not, still the truth of the axiom that "Nothing can arise out of nothing, and nothing can ever be destroyed; all the events which occur in the world consist in changes of form, in the mixing and separating of bodies; the essence of nature is a perpetual cycle"—the truth of this axiom of Demokritos is not disturbed.

Briefly, everything is changeable except that which is unchangeable. All philosophy has to postulate an unchangeable to start from, and this unchangeable gives rise to changing forms of varying degrees of relative permanence. Matter is more or less permanent according to how much we include under that term. Mass seems to be the most permanent thing we know, yet even that may be a variable quantity, capable of being created out of some substratum and of being resolved into it again.

Prehistoric Art in Ireland — Part II

ABOUT 250 lake-dwellings of prehistoric age have already been found in Ireland, and there are no doubt a great many more to be discovered. One in County Donegal was covered by 35 feet of peat which had formed above the original lake-bottom. An abnormally low tide lately revealed the remains of another off the coast of Ardmore, County Waterford, in a place normally covered by the sea. There are many such evidences proving that these prehistoric habitations must be of enormous antiquity. Yet among the many valuable "finds" that have been made in the "crannogs," as they are locally called, many objects occur which show that the builders were far removed from savage conditions. Gracefully carved bone combs (see illustration), pottery, harps, and chess boards are often found. The skill shown in the structure of the crannogs — which have remained fairly intact for thousands of years — under the severe handicap of the primitive tools in use, shows in itself ability and perseverance of a high order.

Few if any gold ornaments have been found in the crannogs. This is probably owing to the ravages of the Danes. Most of the golden objects we have were unearthed from the peat bogs, and were generally found singly. The *torc* or *torque* ("twisted collar" in Irish) of gold is fairly common. Some of these are very large; one known is 57 inches long and weighs over 27 ounces.

These large ones may have been carried on the body, but it is suspected that the smaller ones were worn in the hair as emblems of authority. It is said that when Julian "the Apostate" was proclaimed Emperor, one of his soldiers took off his torque and put it on the imperial head.

Archaeologists have been greatly puzzled to account for the purpose of the golden crescent-shaped plates or lunettes called *mind* in Irish. They were most probably placed upright on the heads of distinguished persons, producing the effect of a nimbus or glory. Many gorgets, or neck collars, rings, and other golden objects have been found whose use is apparent, but there are some things which defy explanation. Among them are the open rings with cup-shaped ends (see illustration) and a curious object resembling a flute with a number of little birds on it. If the latter is really a musical instrument we have certainly lost the art of playing upon it, for there appears to be no way of making sound with it. It is

very probable that some of the curious and inexplicable things found were used by the Druids in their ceremonies and that we shall not learn their use until we regain the lost mysteries of antiquity. It is known that the Druids used a golden sickle-shaped (lunar) knife to cut the sacred mistletoe.

The date of all these beautiful golden objects is quite uncertain; some authorities place them between the fourth century B. C. and the tenth A. D., but they may be far older. They are well made and agreeably decorated, chiefly with geometric patterns, but they show more care and mechanical ability than high feeling for art.

During the same dark and mysterious pre-

A Strange Manuscript

I DO not know who he is, or where he lives, and I have only spoken to him once, though for I cannot tell how long we have sat on the same seat in Kensington Gardens every fine morning. He is old and gray, and bears the look of one whose bitter sorrow has been mellowed into sweet melancholy. In his hand he always carries a certain manuscript, though I have never seen him open it to read or write in it. He just handles it with an affection that seems like that of a mother for her child. One day he turned to me suddenly and asked in an abrupt manner, strangely at variance with his gentle voice:

"You are wondering what is in this manu-

IRISH ANTIQUITIES

1. Gold "torc" or torque probably worn on the head (reduced)
2. Gold object of unknown use (natural size)
3. Bone comb from prehistoric Lake-dwelling

Christian ages to which some, at least, of the gold objects belong, in the dim prehistoric past, the three great tumuli — so-called tombs — on the banks of the river Boyne, about thirty miles north of Dublin, were built. These are enormous artificial hills or circular mounds of stone and earth, now partly covered with trees, the largest being seventy feet high and 1100 feet in circumference at the base. Each one contains passages and chambers, and singular carvings, circles, spirals, "fishbone" patterns, zigzags, and "lozenges" or diamond shapes, as well as what seem to be ideographic inscriptions. These carvings are very carefully executed, and appear to be the earliest remains of symbolic art in Ireland. Representations of human or other forms of life are noticeably absent. Similar designs are found in Brittany and in other Celtic regions, and, singularly enough, in the most primitive Greek remains. The latter resemblance is particularly important and will be referred to in a later article of this series. CASHEL

script?" Then, without waiting for a reply, he went on, "I will tell you. It is a story — a great story, full of imagination and romance, yet not wild. Full of truth and realism, but not morbid. Full of tenderness and pathos, yet the two characters in it are happy from beginning to end. It is the story of a good man who is in love with a pure woman, and she loves him. They have no secret to warp their minds and no sin to warp their souls. There is no obstacle, and they marry. They are happy together, and are blessed with healthy and happy children. Then, in course of time, the mother dies a peaceful death, and the father lives more or less happily with her memory and her children, till he too dies, and is buried in peace by her side."

"And surely that is not all?" I asked.

"What more could you want?" he cried.

"Why," I exclaimed, "there is no story at all — no plot, no incidents, nothing remarkable to attract the reader's attention, nothing

Teaching the Children

AN active woman of education and ability, but, like many another, without a definite idea of life's purpose, had been reading about the Râja Yoga Schools. In telling a Theosophical friend of her own weariness and discouragement she said: "I know that the two or three purple hills I still see for an hour on the horizon would not be purple even could I reach them; and so I have no courage or faith to make the attempt. I remember as a child being told that sorrow was sent us to wean us from the world. Well, I am weaned; I long to go; and yet here I am. I wonder why. It seems as if I had fulfilled my mission. . . . I wish I were one in spirit with you and with your work. If I were I would ask to teach the children, for I am a born school ma'am."

This touches the vital point which makes the Râja Yoga training so essentially different from the prevailing educational methods. The Râja Yoga system teaches first, by example and precept, a practical philosophy of life, and then relates the different subjects of study to the art of living. The usual educational system trains the body and the mind, but, failing to recognize the central fact of the soul as the Perceiver, it has no definite purpose by which the various subjects are correlated into a science of life.

No purely conventional teacher, however cultured and willing, could teach a child Râja Yoga and no one who had lost the faith and courage to try to reach ideals would be allowed to attempt it. There are plenty of "born school-ma'ams" but they can no more meet the crying needs of the hour than can the old theology which fails the teacher so pitifully in its philosophy. What the world needs is a realizing faith in man's divinity and not more enervating theories of vicarious atonement for the adults or the saving grace of more grammar and geography for the children.

The ancients regarded the relation of teach-

er and pupil as something sacred. Perhaps the average instructress would be somewhat appalled to learn the extent of her influence upon the children and its karmic reaction upon herself. As the teacher opens up new worlds of thought to the pupil's plastic mind she unconsciously colors every view with something of her own make-up. She is not only giving them the standard theories, but in ways beyond her own analysis she is giving something of

FORTHFARING

I TRIPPED along a narrow way,
Plucking the same flowers, day by day;
The sun which round about me lay
Had never seemed to sink.

But now at once the path divides;
I see new flowers bloom on all sides;
I stop, while doubt the sun half hides:
I have begun to think.

Winifred Howells --- Selected

herself. A pessimist in private life cannot carry a convincing sense of optimism into the class-room. The teacher's physique and health, her mind and culture and poise, her faith and hopes and morals—all, in some degree, make a lasting impress upon the developing character of the child. What the teacher herself has not acquired she cannot give to the children in her care. Schools and systems have tried it for ages, but the attempt has always been a futile one.

The magic of the Râja Yoga system lies in its naturalness. It symmetrically develops body, mind, and moral nature to meet the needs of a soul incarnating in an animal body. To find the truth after adult years of error brings a joyous sense of liberation; but when the world shall start right with the children, to what shall not the race attain? **STUDENT**

Signs of the Times

DESCRIBING a recent frightful railroad disaster caused by the undercutting, by floods, of the bank of the Missouri river and which resulted in the death by drowning of seven persons and the injury of scores who were imprisoned in the overturned, partially submerged coaches, a Kansas City paper says:

Men and women fought against the waters of the Missouri River in their efforts to escape. But there was no brutality, no selfishness in the desire for safety. Everyone seemed to be thinking of someone else; everyone seemed filled with the desire to do whatever possible to aid those who were more badly injured than they.

In the chair car, where eighty persons were crowded under wreckage, the heroism was shown. It was a case of women first, in everything—including the treatment of the injured. Two women, Dr. Turner Lohveck of St. Louis, and Mrs. Asher Rosseter, the wife of a Pinkerton superintendent, did most of the work. Sheets were stripped from the beds of Pullman berths and torn into strips for bandages, while the two women seemed to be everywhere, ordering the men about, making them roll bandages, aid in the lifting and supporting of injured and in general.

In another paper comment is made upon the seemingly astonishing fact that the entire work of first aid was managed by two women and most admirably, in fact, perfectly. That one had a physician's training and resourcefulness of course made all the difference in the world, for good intentions and ignorance are a poor substitute for knowledge and skilled initiative in any line of work. Yet women, from time immemorial, have found an outlet for their energies and the best in their heart-life in ministering to the sick and helpless, and in these modern days such an example as the above-quoted is by no means anomalous, for women have successfully handled in some of our camp-hospitals in time of war, problems that completely out-generated the whole staff of army surgeons. A notable example was the work of Florence Nightingale in the Crimea. The medieval notion that woman properly

mustn't stir unless some duly qualified authority—her Church, her doctor, or else a sometimes mistaken idea of what constitutes her duty—takes the initiative and provides a track for her to run on, is two-thirds nonsense and one-third atavism. But it will not be dissipated until competency, thoroughness, and skill are as much insisted upon in the education of all women as are the standard virtues and the orthodox intellectual accomplishments. And again, in the unselfishness displayed by those who knew they were facing almost certain death is another of the hopeful signs of the present time. It shows that the soul stepped forth and ruled the lower desires and all personal limitations, bringing out latent nobility and obscuring selfishness. V. H.

Bristol, City of Romance

BRISTOL, a West of England seaport, was during the fifteenth and sixteenth centuries the second English city in importance, and through its harbors carried on a trade with all parts of the world.

The Bristol of today stands out in bold relief upon a background of war, enterprise, reformation, and romance. Its history may be fairly said to begin with the subjugation of Gloucestershire by William the Conqueror in 1068, and it was in the next year that the citizens of Bristol successfully defended their city against the invasion of Harold's three redoubtable sons, Godwin, Magnus, and Edmund, who swept up into Bristol Channel with a fleet of over fifty ships, determined to re-conquer their father's lost domain.

It was to Bristol that King Stephen was brought after his capture by the Earl of Gloucester at the battle of Lincoln, and there he was imprisoned in the castle until the wit and energy of the Queen secured the defeat and capture of Gloucester at Winchester. This "red Earl of Gloucester" was lord of the town and castle of Bristol and one of the mightiest nobles of his age.

King John, later, was much at Bristol, and his successor, Henry III, often came for safety and quiet to Bristol Castle. It was during the latter's reign that Bristol was permitted to choose its mayor after the manner of London. Froissart tells us that in 1387 "the King was at Bristol Castle with the Queen and all the ladies and damsels of her court," and Shakespeare, in *Richard II*, immortalized Bolingbroke's siege of this splendid city.

In Bristol the doctrines of the Reformation were expounded by Cranmer, Latimer, and Tyndale, the then existing religious houses were dissolved, a bishopric was erected and the abbey church of Austin canons was converted into a cathedral.

In 1645 Bristol was besieged by Cromwell

and Fairfax, and after twenty days of resistance surrendered. Of this Cromwell wrote: "We had not killed of ours in the storm, nor in all this siege, two hundred men. He who runs may read that all this is none other than the work of God."

The first Englishman to land in America, Sebastian Cabot, was born in Bristol, and this city was the first in the kingdom to open up regular steam traffic with the United States.

The architecture of Bristol is impressive and dignified, the principal monuments remaining from earlier days being of course ecclesiastical. It was at Bristol that Mary Carpenter, that remarkable woman, lived and worked, and it was due to her that the first girls' reformatory school was established. H.

A LETTER from Germany states that court society is again scandalized, this time not by the exposure of another delinquent of high rank, but because a young noblewoman has actively and publicly, withal most energetically, espoused a not yet popular cause. The Baroness Emilie, niece of the Saxon Minister of War, has stepped out boldly in protest against the saloon evil.

She goes unattended to places where criminals and outlaws congregate, refusing police protection, and reports great progress of her work. . . . She carries no weapon, declaring that "a civil tongue and a kind heart" suffice for an appeal to the most degraded human beings.

The emptiness of life bounded only by personal interests is to this woman unknown.

A STREET IN BRISTOL, ENGLAND

Jottings and Doings

(From a Student's Note Book)

THE following is from a cabled report of the sessions of the Anti-Vivisection society which recently met in London, arousing great general interest:

Owing to the pressure brought to bear upon the police by vivisection leaders, the anti-vivisection society has agreed not to carry banners depicting the horrors of vivisection in Saturday's great procession.

Dr. Helen Burchler of London said that since 1878 more than 350,000 animals have been used by vivisectionists in England. She denied that vivisectionists usually anaesthetized animals before operating upon them. She also denied that vivisection assisted physicians in discovering causes of disease. She asserted that the plague in India, which ought to have lasted eight months, continued twelve years owing to the vivisectionists' futile system of inoculation with plague virus.

She declared that the time was coming when vivisectionists would not be content with torturing animals, but would begin torturing human beings in the name of science.

A Strange Manuscript

(CONCLUDED FROM PAGE 13)

original, nothing out of the common in real life —"

"No story at all! Nothing remarkable! Do you call it nothing remarkable for two people who were once absolute strangers to be united in mind and body and soul? Do you call it nothing remarkable to bring human beings with mysterious minds and souls into the world? Verily, you must have seen strange things! 'Nothing original'! What author has not spoilt this exquisite picture arranged by God with some clumsy crime or calamity arranged by man and the devil? 'Nothing out of the common'! Would the happiness I have depicted were as common as you think! Ah, would to God it were!" Then he lapsed again into silence, as one oppressed by some great sorrow.

And I also was silent.—Ivan Julius Collins, in *Westminster Gazette*, London

OUR YOUNG FOLK

Oliver Wendell Holmes

JUST a century ago Oliver Wendell Holmes was born in Cambridge, Mass. His entry into the world was marked in his father's almanac by the laconic record of *son b.*, against the date August 29, 1809.

His father, the Rev. Abiel Holmes, was puritanical to a severe degree, and in this orthodox atmosphere young Wendell was reared, chafing against Calvinistic training and resenting it even down to old age, if it can be said that anyone so kindly, genial and light-hearted by nature could feel bitterness in his heart against anything.

After he had graduated at Harvard University, he began to read law, but found it unsuited to his taste; then he studied medicine at home and in Paris, and in 1836 he hung out his physician's sign in Boston and began his career as Dr. Holmes. Some witty critic has accounted for his lack of patients by saying that because of Dr. Holmes' characteristic announcement, "the smallest fevers thankfully received," people who had no fever laughed and enjoyed the joke, but those who had fever would not call in a physician who seemed to treat the matter in such a light and jovial way. His success lay in his medical essays and lectures; he was professor of anatomy and physiology in the Medical School of Harvard University for 35 years.

However, it is not as a physician or a Harvard professor that the world remembers and loves Holmes, but as the author of the Breakfast Table series of books, especially *The Autocrat of the Breakfast Table* and *The Professor at the Breakfast Table*. They came out in serial form in the *Atlantic Monthly* when Lowell was its editor-in-chief. How their easy, graceful, conversational style delighted our grandmothers and grandfathers half a century ago! His novels also appeared in the pages of the *Atlantic Monthly* and he published successive volumes of verse. Flashing wit, whimsical humor, gayety of heart, and a rare quality of youthfulness so characterize his work that young people can enjoy nearly everything that he wrote, and even very young folk enjoy many of his poems such as *Flower of Liberty*, *The Last Leaf*, *The Wonderful One-Hoss Shay*, etc.

Dr. Holmes was also famous as a speaker. He lectured on the English poets and other literary themes in Boston and many of the New England towns. He said to his audiences, "It is because you are just like me that I talk and know you will listen."

Many of his sayings, such as "the world has a million roosts for a man but only one nest," give us an idea of his love of home. His declaring that he always considered his face as a convenience rather than an ornament, shows how good-humoredly he accepted his lack of personal beauty. He loved his college and made the "class of '29" famous by the poems he always prepared to celebrate its annual reunion, which he attended for an unbroken period of 30 years. In his young days his class poem was always rollicking and brim-

ming with life and fun, and he generally sang the lines instead of reciting them, thus adding greatly to their flavor. In fact these poems never grew very serious even when the class of '29 had grown old and dwindled until he had become the Last Leaf on the Tree.

The Last Leaf sounds as if he felt a certain relish in describing the infirmities of age; for old age could not sadden the spirit of one who could, in spite of Puritanical training, write the last verse of *The Chambered Nautilus*. There was something in him which knew the

THE CHAMBERED NAUTILUS

THIS is the ship of pearl, which, poets feign,
Sails the unshadow'd main,—
The venturous bark that flings
On the sweet summer wind its purpled wings
In gulfs enchanted, where the siren sings,
And coral reefs lie bare,
Where the cold sea-maids rise to sun their streaming hair.

Its webs of living gauze no more unfurl;
Wreck'd is the ship of pearl!
And every chamber'd cell,
Where its dim dreaming life was wont to dwell,
As the frail tenant shaped his growing shell,
Before thee lies reveal'd,—
Its iris'd ceiling rent, its sunless crypt unseal'd.

Year after year beheld the silent toil
That spread his lustrous coil;
Still, as the spiral grew,
He left the past year's dwelling for the new,
Stole with soft step its shining archway through,
Built up its idle door,
Stretch'd in his last-found home, and knew the old no more.

Thanks for the heavenly message brought by thee,
Child of the wandering sea,
Cast from her lap, forlorn!
From thy dead lips a clearer note is born
Than ever Triton blew from wreathed horn!
While on mine ear it rings,
Through the deep caves of thought I hear a voice
that sings:—

Build thee more stately mansions, O my soul,
As the swift seasons roll!
Leave thy low-vaulted past!
Let each new temple, nobler than the last,
Shut thee from heaven with a dome more vast,
Till thou at length art free,
Leaving thine outgrown shell by life's unresting seal!

Oliver Wendell Holmes

Truth though he may not have been fully conscious of it; for it came out occasionally in such theosophic thought as that poem contains.

Holmes belonged in spirit and time to that group of men who gave to New England a place in the world of letters: Longfellow, Holmes, Emerson, Lowell, Hawthorne, and Whittier, gave to posterity all that was noblest and best in Puritanical New England. It was said that in New England, poet was synonymous with one of gentle blood, and it is equally true that the lives of these men were as clean and irreproachable as their birth and breeding were superior. All American writers acknowledge a debt of gratitude to them and their

literary associates. A good comradeship existed among these literary folk, and the love and reverence they felt for Boston has been compared to that patriotism felt in the past by the citizens of Florence and of Athens.

Holmes declared that his fame would rest upon his having said, "Boston is the hub of the universe." Certainly all that he did and said showed his love for his city. L. B.

The Argonaut

THERE is a little sea-animal, who, by his beauty, intelligence, and skill, has won for himself the famous name of Argonaut.

The Argonaut belongs to the kind of animals who live in shells. They are called mollusks. Because the shell of the Argonaut is all in one piece, it is called a univalve; if there were two pieces it would be a bivalve. The Argonaut belongs to the same family of mollusks as the Chambered Nautilus which the poet Oliver Wendell Holmes describes so beautifully in the poem on this page.

The Argonaut has a much thinner, more delicate shell than the Chambered Nautilus. On account of the thinness of its shell, it is sometimes called the "Paper Nautilus." This shell is oval and rather flat on the outside, but rolled into a spiral within. The last round of the spiral is so large that it curves the shell upward most beautifully. It makes it look like an ancient ship with graceful upturned prow.

The little animal who lives in this pearly, many-hued ship, has eight arms or tentacles. Two of these tentacles are broad, thin, and rounded, just like wings or sails.

When the Argonaut is resting or walking on the bottom of the sea, these sails are folded away. When he wishes to rise to the surface he draws himself into his shell, turns this over, keel upward so no water may enter, and goes straight to the top. Arrived at the surface he gives a quick little turn and sets his boat right. Then he unfurls his living sails, places two more of his arms on the water to act as a rudder, and then sails away like an elfin ship, steering whither he wills. If danger threaten, he turns over again, fills his ship with water, and sinks from sight.

The Greeks and Romans, and even the ancient Chinese, loved and admired these gallant little mariners, and wrote stories and poems in their praise. In India during the solemn sacred dances, the dancers carry one of these shells in the right hand and hold it proudly above their heads.

But think what a lovely sight it would be, to meet a thousand of these fairy ships on a moonlight night, trimming their tiny sails to the midnight breeze, an Argonautic expedition sent out by Mother Nature. STUDENT

SPEAK clearly if you speak at all;
Carve every word before you let it fall.

I FIND the greatest thing in this world is not so much where we stand, as in what direction we are moving.—O. W. Holmes

THE NEST OF THE MISSEL-THRUSH

How a Fairy Made His Fortune

ONCE upon a time there were two fairies who had been given the duty of taking care of a cluster of arnica-plants in the garden of a pretty little cottage. In the cottage lived a little girl who was even more beautiful than the flowers, because her soul shone out in her face and sounded in her voice, so that to look at her or listen to her was like hearing the sweetest music. The two little fairies loved her very much and wished that the prince who had charge of the whole garden had given them some other work to do, something to please the little girl.

"If I had only been put to take care of a rose-bush or a lily," said one, "something that she likes, I should be so happy and work so hard that next year I might be allowed to be one of her own attendants; but what can one do for her here? She never sees these coarse plants, and they would not please her if she did see them."

"But it is our work," the other replied, "and we should do it as well as we can. After all, this is part of the garden, and she may like the odor, or like to see these plants from a distance."

"Hateful old weeds they are, and nothing else, I won't water mine any more, it's no use. I shall go and help in the pansy-bed," replied the complainer, "she likes *them* and comes every day to look at them."

"But if you go away your plants will suffer, because I have all I can possibly do to attend to these," replied the other. "Let them wither, then," answered the discontented fairy, "I'm going." And sure enough, off he went.

Now there came a time of very dry weather and the gardener was kept busy watering the

Dare to do right! dare to be true.
The failings of others can never save you.
Stand by your conscience, your honor, your faith,
Stand like a hero, and battle till death.

more delicate plants, so that many of the others soon began to feel very thirsty. Then there was much work for the fairies in managing the rootlets so as not to let them drink all their water at once and to bring to them what was just beyond their reach. The arnica-plants which had been left to themselves did bravely for a few days but soon drank all they could reach and then began to wither.

But the other little fairy tended his faithfully and kept them bright and green. One day he heard a great fuss at the cottage; the beautiful little girl was crying and the doctor was sent for. The robin said she had fallen and hurt her wrist very badly. But the doctor was away and would not be back for a long time; so the white-haired old grandmother came out into the garden to the cluster of arnica and pulled up the strong green plants, but would not have the others because they were withered and small. Then she took water and put the plants to steep, until presently they were ready, and she made a dressing for the aching wrist, to lessen the pain and help to cure it.

Then the fairy was much pleased to see what was done with his plants and that they had been of good service to the beloved little girl. He went back and did all he could for the others and in a few days their health was so much better that when a second supply was wanted the old grandmother found them im-

proved and quite fit for use. Then the fairy was very glad indeed; but now he had no work; so he went to the prince of the garden, who gave him the duty of putting fresh dew, every morning, on the roses which grew by the little girl's window where she liked to come, the first thing, to see the new day and pick a rose.

But the other fairy, who would not do his work, was driven out of the garden and could not come near the little girl at all.

RALPH WYTHBOURNE

Some Queer Cradles

IN Lapland a new-born baby is cradled in its mother's shoe, a big affair, covered with skin and stuffed with soft moss. This the mother can hang to a tree or cover with snow, while she is busy.

In India the baby rides in a basket which hangs from its mother's head, or from her hips in a hammock. Sometimes the baby's nose is adorned with a nose-ring; and in some parts its face is wrapped in a veil like its mother's.

The Chinese baby is tied to the back of an older child; while the Mongolian infants travel about in bags slung on a camel.

Strangest of all, the mother, in Guinea, buries her baby up to its waist in sand, and that is the only cradle the baby ever knows.

J. H.

The Missel-thrush

THE missel-thrush, or mistle-thrush, is a well-known English thrush, and is the largest bird of its kind in Europe. It is said to have received its name because of the fact that it feeds upon mistletoe.

THE MYSTERIES OF THE HEART DOCTRINE

PREPARED BY
KATHERINE TINGLEY
AND HER PUPILS

The Theosophical Book *of the* Twentieth Century

Tells the story and the history of the Theosophical Movement.

The prices are \$2 in cloth and \$1 in paper, which barely cover the cost, for it is printed and bound, not gaudily, but with such carefulness and thoroughness of art and craft as to make it unique among modern edition books.

ORDER FROM THE
THEOSOPHICAL PUBLISHING CO., POINT LOMA, CAL.

Isis Conservatory of Music OF THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY POINT LOMA, CALIFORNIA

Personal applications and inquiries received every Saturday
by the Secretary at SAN DIEGO BRANCH

ISIS HALL, 1120 FIFTH STREET

between the hours of 9 A. M. and 4 P. M. Full particulars will be sent by mail upon application to

Was Jesus Divine?

WAS Jesus divine, was he the Son of God in a special way in which other men are not? If he was, then the example of his holy life is not of much use to us, for he had overwhelming advantages in his favor, which we have not. This has often been felt, and it has seemed to many a mockery to hold up before them examples of what a divine Son of God can do, and at the same time to tell them that they are not Sons of God, but mortal sinners. Jesus himself, however, according to the Gospel narratives, as also some of his disciples, taught that every man was divinely born and a potential Christ. Many churchmen of broad views now recognize this fact. All men are potential Christs; but from time to time there incarnates one who is in advance of his age, as a Teacher in times of darkness. He is a Christ, and there have been many besides Jesus. But, though they claim a Divine inner birth, they do not claim it as an attribute peculiar to themselves; they teach that the Divine birth is a latent attribute of all men. Jesus, in his conversation with Nicodemus, speaks of the "second birth:"

The Divine Self in Man

Except a man be born again, he cannot see the kingdom of God. . . . Except a man be born of water and of the Spirit, he cannot enter into the kingdom of God. That which is born of the flesh is flesh; and that which is born of the Spirit is spirit.

In using the term "second birth," Jesus was using an expression well known in the parlance of students of the ancient Mysteries; as he was also in using the terms "water" and "Spirit." Physical procreation provides the tenement for the indwelling Soul; the Higher Soul itself "cometh from afar," and is not of terrestrial but of divine origin. A man is said to be "born again" when he takes a certain step in his development, when he recognizes the Divinity within him (spoken of as the "Father") and vows to abandon his previous selfish indifferent life and follow the guidance of his Divinity. Then he begins a new life and experiences a second birth; the Divine nature has, as it were, been sown in the human nature, and the human nature henceforth grows more and more into the likeness of its Divine prototype.

This was the teaching of Jesus, as can be seen from his accepted utterances, and it is acknowledged to be such by many leading divines of today. But it is also the teaching of other great sages, as may equally be proven by reference to their teachings. In short, it is one of the eternal verities; and, as such, has been taught in all ages by

enlightened men, teachers of true wisdom. Jesus was neither a special and unique Son of God, nor a mere philanthropic human being. He was an Initiate—a man who had progressed in development to a point which for most other men lies yet far in the future. He had performed the At-one-ment, or uniting of the human with the Divine; his Divine nature had become consciously active in him. He had mastered the lower passion nature; and, being no longer under its dominion, was able to make it his servant, and *by that very fact*, to perform the deeds which are called "miracles," i. e., wonders, prodigies, but not supernatural in any sense of the word. Having overcome the *delusions* of the lower mind, he was filled with *wisdom*. He could read men's hearts and minister to their real needs. His chief object was to set the feet of other men on the same path; and to point out to them the way to emancipation and understanding.

We should take Jesus, the Christ, together with other Christs, as examples of the possibilities that await all men, and aspire to the condition of emancipation which these Sages have held up to us. They have taught how to find the road to peace and happiness in present opportunities; to take for ideal that of the conqueror who is lord over his own subjects and king in his own domain. The foes we have to withstand and which keep us in bondage, are the untamed desires and false mental pictures of our mortal nature. The power we must invoke in order to withstand and overcome them is that of our own real divine Self, which has its seat in the Upper Triad, Atmā-Buddhi-Manas. By following the precepts of Jesus as to study, compassion, and purity in conduct, we can gain the light which will light our footsteps on the path we have chosen. And this path is characterized by the absence of all pretension and self-glorification.

STUDENT

Science Bursting its Barriers

EVERYWHERE we look we find evidence that the reign of materialism is passing away, and that there is a renewed interest in things unseen. In scientific papers we find curious unexpected allusions to subjects which a few years ago would have been considered quite out of place there. The beliefs of the ancients are always being brought up; writers seem unable to keep away from the subject; it is "in the air."

For instance, in *Knowledge and Scientific News*, one writer takes as subject, "Stones from Heaven: the Veneration of Meteorites in Ancient Times." Beginning with the orthodox scientific remark, that before the advent

of strict scientific investigation, it is no wonder that stones which fell from heaven should become objects of veneration, this writer gives quite a lengthy account of various sacred stones of antiquity, launching out into totally irrelevant particulars about the temple of Diana at Ephesus, its size and construction. Thus the article becomes an account of the beliefs of antiquity on the line of what might be found in *The Secret Doctrine*, and naturally leads the unprejudiced reader to ask himself whether all these mighty nations whose opinions are quoted may not have had for their views some better ground than mere superstition.

Another writer undertakes to give some notes on the "Ancient History of the Planet Mercury," but it is quickly evident that the planet of that name plays but a very small part in the history he recounts. In fact he mixes up astronomy with quite other matters in a wholly impartial manner. It may be relevant to give Cicero's statements about the position of the orbit of Mercury, and Ptolemy's observations for the year 265 B. C. But is it relevant to mention that the Assyrian and Babylonian Mercury had under his care all learning and knowledge? Can this have been the planet? Also, what is the mere scientific planet Mercury doing with a female consort? The subject of the temple of the Seven Spheres may be very interesting and instructive, but how does it come to be described so particularly in a paper on the planet Mercury in a scientific magazine? Clearly the Mercury here mentioned among so many different peoples, under so many different names cannot be the humble and inconspicuous planet; and again the reader is led to ask why all these great nations of antiquity should, with one consent, and with a universality that bars the thought of collusion, have agreed to represent Mercury as the god of wisdom and to make such an important matter of his worship. The papers have to write down what is in the air and what their readers want, no matter what their title may be. They are signs of the times and one is glad to see them.

Again, in the same journal, we find it noted that some years ago a French physiologist wrote a paper to show that the colorless fluid in which the red corpuscles of our blood float, is the same fluid as that which constituted the primeval sea. In this fluid floated the earliest forms of life, all naked and uncovered, so that their cells were bathed in the primeval brine. But, alas! for the shade of Charles Darwin, whose centenary is largely dealt with in the same number, the writer does not forthwith pack his trunk and sail the globe in search of facts. This one point about the salinity of the blood plasma seems quite enough for him, and he launches forth into his speculations without more ado. Evolution raised that primeval jelly-fish into an animal with a silicious covering, and some of the brine got shut in; so that when finally the creature evolved into a land animal and waded ashore, he took a portion of the primeval ocean with him in his veins, so that he might bathe his corpuscles whenever they were tired, without resorting to a sea-bath. And ever after man has walked the earth with drops of the archaic sea laving his corpuscles.

How is this for folk-lore? Compare it with the beliefs of the ancients. Put it into the form of a translation from Herodotus:

Now in the land of Gallia there are physicians whose skill is so great that many resort to them from all parts of the world. And while sojourning there I was told this story on very credible authority, namely, that they have a singular belief as to the reason why the blood of men and animals is salt. For, say they, in the times before the age of Historius, there were no living creatures on the earth save such as swam in the ocean, which in those days covered almost all the earth. Now these creatures had no blood, for their veins were, as it were, open, in such wise that the water of the sea served them for blood. And when Evolution changed these creatures into creeping things, he enclosed a portion of the sea within their veins, that they might not die, and this became blood. And so it came to pass that ever after that day all creatures, and man likewise, have sea-water in their veins. This story appeared to me to be very singular, but as it was the belief of many reputable persons, I thought well to write the same down.

It is added that experiments have proved that white corpuscles can continue to live in sea-water. Apart from imaginative evolution theories, an interesting analogy is brought out between the organisms swimming in the sea and the organisms swimming in the brine of the human body. By collecting these analogies science is accumulating material which may help to show that the ancients had some reason in speaking of water, salt, etc., as universal elements, instead of restricting the meaning of the terms, as we do, to the physical, chemical, substances of those names. Ancient knowledge may have been aware of broader generalizations than our science has yet ventured upon. The human body is seen to be, in one aspect, an ocean of brine, wherein swim minute creatures.

These freer views of science certainly do often lead to truths which the more laborious methods would never attain to. It shows that the intelligence of man will not be bound down by methods, and that the intuitive faculties play a very large part in scientific research.

STUDENT

What is the Function of the Brain?

IN a scientific note it is stated that—

In modern physiological theory the brain is not the sole depository of thought or mind. Man thinks not only with his brain, but in a certain sense with every organ of his body.

Most people are under the impression that this was the *ancient* view, and that the moderns located mind and thought in the brain. The very words surviving in our languages prove that former generations located the mind in the heart, bowels, spleen, kidneys, gall, etc., and not in the brain alone. The above note implies that modern science is coming round to their view, though it ought to give them more credit.

Modern science knows very little about the functions of the brain, and this large and elaborate organ seems to have a structure altogether out of proportion with the functions that have been traced to it. H. P. Blavatsky tells us that *the brain is the organ of a power higher than the personality*. The ordinary mind and thoughts of man have nothing to do with the brain, but operate through the sympathetic nervous system and its ramifications in the bodily organs. In fact, while the nervous system and organs are the center for the *lower mind*, the brain is the organ of the *Higher Mind*—as yet almost wholly inactive in the average man.

This is where the Theosophical teachings

as to the duality of the mind (the *lower manas* and the *Higher Manas*) connects with physiology. Until the existence of the Higher Mind is admitted, many physiological mysteries will remain unsolved. Again, the neglect to discriminate between the Higher and lower mind has led many to suppose that the human mind is dominated by the bodily functions. But, while it is true that powerful instincts and desires are seated in our bodily centers, and that we may weakly allow them to occupy the arena of our thoughts, it is also true that we have aspirations, ideas, and purposes which are quite disconnected from the animal propensities and their physiological centers.

Occult physiology teaches that the body, as a vehicle of mind, is twofold in its structure. It is compared to a harp with two sets of strings, one set of coarse catgut, the other of fine silver wire. The catgut strings respond only to the grosser thoughts and emotions, such as proceed from the lower mind; the finer strings will not respond thereto, but can only be made to vibrate in response to the breath of the Higher Mind. The cells of the body may vibrate to the touch of the lower mind, with its selfish thoughts and animal desires; but the atoms within those cells can respond only to the touch of the Master—the Higher Mind, with its pure motives and lofty aspirations.

Thus, even physiologically and anatomically, man is dual—the Angel and the demon, the Flame and the clay. The Spiritual nature is not a mere abstraction; it is a real Being and has its temple here on earth. But it is little wonder if our bodies, after long generations of abuse and pollution by gross living, and after long neglect has well-nigh atrophied their higher functions, should fail to manifest their higher potentialities.

Long training in *purity of life* is an indispensable preliminary to the mastery of the higher functions of the body. Without this, all attempts to evoke "occult powers" result in an intensification of the gross animal nature, leading to loss of moral and mental balance, as has been demonstrated in the case of some who have wandered from the true path through ambition or vanity.

There is plenty of knowledge in store for those who are qualified to receive it. They may learn the mysteries of their nature, spiritual, mental, psychic, physiological. But, as said, wisdom is to the pure; knowledge, for the strong. All that Teachers can do, in this age, is to disclose enough to point the way, so that those who will may follow. So long as selfishness is the ruling power in the world, all the powers of the lower nature will be used in a way disastrous to the race and to the individual. Therefore the Spiritual powers have first to be evoked by purity of life, for by them alone can the lower powers be controlled.

STUDENT

MOTHER Shipton prophesied we should go over and under rivers. But now we can go through two others elements besides earth: water, by submarine; and air, by aeroplane. The crossing of the English Channel by M. Blériot in an aeroplane is the culmination of a century of invention, without a parallel since Atlantean times. And like Alexander we shall soon be wishing for more elements to conquer. Perhaps there are more. J.

Some Views on XXth Century Problems

The Opportunity of Age

NO reviewer of M. Finot's much reviewed book on longevity has pointed out the really weak place. He tells us that we die much before we need, giving us this prescription:

It is suggestion ill employed which undoubtedly shortens life. Arrived at a certain age, we drug ourselves with the idea of the approaching end. We lose faith in our powers, and they abandon us. Under the pretext of the weight of age upon our shoulders, we take on sedentary habits. We cease to busy ourselves with our occupations. Little by little our blood, vitiated by idleness, together with our ill-renewed issues, opens the door to all kinds of diseases. Premature old age attacks us, and we succumb sooner than we need in consequence of a harmful auto-suggestion. Now let us try to live by auto-suggestion instead of dying by it. Let us have ever before our eyes the numerous examples of robust and healthy old age. We must store up in our brains healthy, serene, and comfortable suggestions.

Then he tells us, very truly, that the soul and in a certain sense the body are immortal: thinking that with these knowledges, and the further knowledge that with the application of his prescription we can add another twenty or more years to our lives, fear of death will disappear.

But it will not, unless a man learns not only that his soul is immortal, but that he is that soul; and that old age is a pre-eminently favorable time for full realization. It is no more desirable to prolong middle age, with unchanged mind and occupations and interests, into old age, than to prolong childhood, similarly unchanged, into adult years. Each of the three periods of life has its appropriate belongings and doings, each developing something almost peculiar to itself.

Childhood is physical; adult life intellectual; old age spiritual—which does not mean that in the first there can not be and should not be any intellectual or spiritual work; that in the second there should not be any physical or spiritual culture; or that in the third the intellect and body should be given no further work and attention. But each stage should develop the basis for the next, a sound mind resting on a sound body, spiritual consciousness being gradually cultured in the intellectual. If the other parts of life have been properly lived, then, as the senses and organs begin at last to fail, that very failing will be the unhampering of spiritual consciousness; old age will enrich and deepen instead of dimming; antiquity's ideal of wisdom will be reached. By the time that death comes, and it may be long before, the consciousness of *being* soul, not of *having* it, will be perfected, and death will have absolutely lost its terror. It should be *reached* in childhood; it should be held and developed throughout middle life; then in old age it would function positively, even as in middle life the intellect pre-eminently and positively functions. For this consciousness is not mere quiescence and beatitude; nor is it what is ordinarily called piety. When developed it is as much a functioning part of man as is the body and intellect. Old age should make of each man a teacher to others of what he has learned to see.

Repeating this achievement life after life, we should find that in each of them the spiritual awakening came earlier and more easily and reached greater perfection. It is by this that humanity's great Teachers have come by their rank.

The Infinite Revelation

TURNING in thought from what men and women are, to what they will be, and holding that picture constantly in thought, is one of the ways of becoming ourselves what we shall be.

Within every creature a unique revelation is concealed. Once that Reincarnation is considered, it is not so hard to realize that. The highest creative geniuses came slowly through many lives of effort to what they are or were. Has not each, whose work we have entered into and appreciated, revealed to us something unique? In his work, in his hour of creation, each went up to the highest and raptest state possible to him and brought down what he found there. No one else could have brought it; Wagner could not have given us the *Ninth Symphony*; nor Beethoven *Parsifal*; nor either of them *The Divine Comedy*. Yet the two musicians, though they may never have read the poem, went the higher because it had been composed and was in the air and had been lifting the general consciousness for centuries.

As each of us, in this or some other life, begins to lift himself towards the eternal and infinite Light, it begins to give us a message, a revelation of itself, *for the rest*. Receiving and translating it, we help each of the rest in some smaller or greater degree upward on his path to that same Light for the reception of his message, needed also by us.

The entire message and revelation of infinite Light is only by way of the infinite totality of lives. Its message for the group of our earth is by way of all earth lives. Its delivery in fullness waits until all earth lives reach up and get, each for itself and the others, what is there waiting. That is the promise of perfect brotherhood. Unwise and untrue to his humanity is he who despises or hates or rejects another; for so long as he does so he is keeping his soul shut to a message that may even now be developing in that other. And as each can only conceive so much of the infinite Light as is within himself, he is surely ill-advised in shutting out any of the rays that may come in to him from his fellows. The ultimate Divinity is that which, when approached by any man, awakens in him the power to confer something necessary for their growth upon others; it is absolute beneficence. For that reason is compassion the path to it and the sun that lights that path. Compassion comes from the attempt to see in all men and women some ray of that divinity which shall sometime shine out in all their being, however completely it may now be hidden in flesh and passion and mental darkness.

The universe is for the expression of its supreme soul by its children. As they progress, new ways of the expression will open

up; they will develop new powers, new creative arts. Sometime, nature herself—*material* nature, as we now call her—will be the canvas, and human creative imagination the painter thereon. For nature will be given to man to fashion as soon as he is ready. That will be the new earth.

STUDENT

"Nature"

HOW often and for what lengths of time will people dispute about "Nature" without any preliminary definition of the word! There is perhaps no word with more meanings. There is the "Nature" which we are advised to "live close to," to whose voice in the winds and trees we should listen; there is the "Nature" which we question as to her goodness or badness and sometimes accuse of being wholly red in tooth and claw; there is the "Nature" to be followed by obedience to every elemental passion.

One of these Natures, Professor Weinert tells us in the current *Hibbert Journal*, was once the basis of a little religious cult in Germany:

There used to be in Friedrichshagen, on the shore of the Müggelsee near Berlin, a circle of young writers tired of Naturalism in art . . . who founded a community for the purpose of cultivating this new religion in the course of common walking tours. Their intention was to cultivate the power of listening to the secrets of Nature, of feeling and reverencing the great All of life, which, surrounding us on every side, speaks to us in mysterious language through man and beast, through tree and flower, through wood and lake and rock. By these means they would behold the "New God," and conquer the "Future Land" of humanity, the "Third Realm," the "Realm of Fulfilment."

The group, like many another such, has broken up. But if you are going to Nature to find her consciousness, her soul, with what organ of cognition will you detect it? And what is this god, or goddess, worth to humanity—her children—if they can only find their mother by weeks and months of leisurely sojourn by the side of mountains and lakes? Is that necessary? If they are her children, every finest quality and element that she possesses, from her midmost soul downward, must be present in them. Why need they look beyond themselves to find her?

Let her be judged—first as to goodness and badness—by the highest of her children, men and women, and by the highest that there is yet evolved within them. The judgment is rendered. The organ by which her soul can be known, is man's own soul; only in proportion as he gets awake to that, or gets that awake in him, can he look beyond himself and know her. He must find his absolute self-conscious highest and look through the eyes of that. Unless he has begun that inner looking she will be but an appearance, however beautiful. Mere sensitiveness to natural beauty, however extreme, unless moral values are being cultured in the soul by meditation and aspiration and compassion for all that lives, is no safeguard against a grossness that will finally destroy it and wipe out the possibility of real comprehension of Nature. With the results of such culture in full activity, this sensitiveness is a step to comprehension. C.

The Temple of Castor

THIS temple was founded to commemorate the apparition in the Forum of the Dioscuri announcing the victory of Aulus Postumus at Lake Regillus, B.C. 496. It was restored in 119 B.C., and rebuilt in 6 A.D., to which period belong the three existing Corinthian columns and piece of entablature, of the finest workmanship, in Pentelic marble. The podium is an example of the enormous solidity of Roman construction. Solid tufa walls, 8 feet thick, are built under the whole of the cella and the front row of columns, while the side columns rest on spurs of similar walling. The interior of the podium is filled up by a solid mass of concrete, of broken stone and lime, the whole forming a platform 22 feet high, solid as a rock, on which the superstructure is erected.

Ancient Sky-Scrapers

SKY-SCRAPERS cannot be reckoned among modern inventions, except perhaps so far as steel construction goes, as the *Kansas City Times* points out, quoting some facts in support.

Herodotus says that there were houses in Babylon four stories high and that in Carthage houses often exceeded six stories. In Tyre, where the building area was limited, there were houses ten stories high, as in other sea-side cities, according to Greek historians. In Jerusalem were houses eight and ten stories high; and one rabbi speaks of having to climb more than 100 feet to his room. Athens had a building law limiting the height of residential structures to ten stories. In medieval Venice, where space was crowded, the height was limited to 70 feet, and in Florence to 100. Rheims had a law forbidding any residential structure to rise higher than the eaves of the cathedral.

But, excluding residential buildings, the ancient world surpasses us in the matter of size. One has only to mention the Great Pyramid, the temples of India and adjacent countries, and the masonry of Peru and Mexico.

Prehistoric Remains in Essex County, Massachusetts

THE Newburyport *Daily News* has an article on the age and origin of the thousands of prehistoric implements commonly known as Indian relics, found in all parts of Essex County, Mass., in graves and shell-heaps, and just beneath the surface of the fields. The writer concludes that they may

be classified as follows: a few are the relics of the earliest primitive inhabitants and may be 1000 years old; the majority are of Algonkian local workmanship, made from Essex County rocks or other native materials, nearly all prior to 1620 A.D. The objects of foreign introduction are European, brought not earlier than 1500, and few of them later than 1630.

The older relics consist of shell-heaps, chiefly clams, but also oysters; and there are bones, broken implements, and pottery; in one case human bones, in a compact mass, as if turned out of a pot, seem to indicate cannibalism. The Algonkins have left carved stone faces, carved animal figures, and stone implements.

The writer says that the original peopling of this country must remain a matter of speculation; and that the most reasonable theory would seem to be that the primitive man came from Europe through the northern regions in remotely early time, before the glacial period; that these were then forced southward by the ice-sheet, the southerners becoming more advanced, while the northerners remained primitive. After the recession of the

ice, the north became re-peopled from the south.

One feels inclined to ask, Why suppose that the inhabitants ever came from Europe at all? Is not this a rather one-sided way of looking at it? Here is surely a chance for Americans to declare a new Independence by forswearing their allegiance to tyrannical European theories and establishing an independent theory of their own to the effect that the primitive Europeans came from America. Doubtless the Behring Strait road, like most roads, led two ways, one back and the other forth. Have we not in America the ruins of ancient temples which can vie with those of Egypt, and whose walls are decorated with strange hieroglyphical languages which promise, when they are fully deciphered, to be the gates to a knowledge even more profound than that of ancient Khem? Have we not in Peru the remains of architecture on a scale of such unparalleled immensity that nothing, even among the colossal structures of the Old World, can compare with it? Why then may not the Old World have been peopled from the New?

One cannot but think, too, that the writer has somewhat neglected the great prehistoric civilizations of Central and South America, and that any theory of the peopling of America which does not take them into account is somewhat partial and premature. What figure, for instance, would savages of a few centuries ago cut by comparison with the great pre-Incan builders? In fact the writer seems to be handicapped by the theory that the human race has developed within a comparatively recent period from savagery, a theory which is now rapidly becoming superannuated. The most advanced archaeologists now admit that savagery is a condition existent upon the earth in all ages and indicative of nothing so far as a historical time-scale is concerned; and that kitchen-middens and bone-yards are being accumulated in various places as we write. It has been sagely pointed out that our own civilization would, after the lapse of a millennium or so, yield to the archaeologist of that day an interesting but not very informing collection of just such articles as we are now digging up; for our iron pots would be veins of hematite and our copper blue vitriol, and there would not be a shred of the triumphs of modern industry left. Beyond a few stone foundations, there would be no architectural evidence; and the archaeologist would have to solace himself with clamshells and earthenware. T.

COLUMNS AND FOUNDATION OF THE TEMPLE OF CASTOR AND POLLUX IN THE FORUM, ROME

✻ The Trend of Twentieth Century Science ✻

The Return to Animism

HOW long now before science comes back to "animistic savagery"? In its European young days it set itself to understand and explain this perplexing universe of matter. Why do things behave as they do? Why does matter move and change in the stone and the tree and the test-tube? The animising savage would say. Because it has a soul or a lot of souls in it which move it and change it.

But that is animistic savagery; it will never do for us. Suppose matter consists of a lot of almost infinitely small round things, each like any other and each possessed of a given amount of energy and inertia; how is that for an explanation? It seems to work very well and we say accordingly that such round things actually *are*, and call them molecules. The savage endows matter with a conception of his own mind—a soul; every tree has a soul, and so on. We laugh at him whilst endowing it with a conception of *our* minds, namely molecules!

But presently we found that we could not explain happenings by regarding the molecules as all alike. So we invented another conception. Each molecule, still being a little round thing, consisted of still smaller round things, atoms. Some molecules had two, some twenty, and so on.

But without our noticing it, the molecule has now departed from the plane of matter, has become metaphysical, has even ceased to exist whilst still existing! By a part of its definition it is a round thing. But it may also consist of two smaller round things, atoms, side by side. Let anyone try to construct a sphere of twelve inches diameter by putting beside each other two spheres each of six inches! The molecule is evidently a mere conception of our own with which we mentally surround two or more smaller things.

Some deeper phenomena have now required us to attack the atom in the same way. It too has become an imaginary sphere containing still minuter round things, the electrons, each with its inertia and charge of energy. The universe is now thoroughly explained by reading into it a series of often incompatible conceptions born in our own minds. And we still go on laughing at the savage because his conception does not happen to be ours.

But now they say, Why have the little round things at all? Why not wipe away these things *possessing* energy and inertia, and have *only* the energy and inertia? There are no things at all; the energy pulsates from its centers through the ether. We *must* have ether to account for the energy pulsing about. The ether is (admittedly, this time) a *conception* which we *must* suppose to be real. It is even *two* (at any rate) conceptions, being infinitely elastic and as rigid as steel; and we are extremely sorry that these two are incompatible, for they simply *must* combine! But, happy thought! why not try the little round things again? So the ether is a set of round things still smaller than the electrons. Now surely we are all right. And that absurd savage,

actually daring to read his mere conception into nature! And those ridiculous metaphysicians, daring to read theirs, reifying—"thing-ifying"—their concepts!

Finally it turns out, when *all* the little round things have disappeared into mere centers of energy, that energy itself is but a *conception* read out into nature to account for our *perceptions*! It is but a comment of thought to account for feelings that now are, or were and have become memory, or will be or may be! And "nature" is likewise but a conception of the mind to account for, or lend a basis to, changes and strains of feeling that are, have been, or will be! We are as animistic as the "savage"! Only our *anima* is inanimate.

Why does not science rise to the situation and admittedly consider energy to be active feeling in that "stuff" which we know to have the capacity of feeling, namely mind? It would not be, then, that the substantive universe is an extension of my mind; but that my mind, and any mind, is an *intension* of the greater mind, a drop in that ocean. I can know it as it plays around me because of this identity of essence. Mind, becoming thus ever richer, becomes ever more perfectly the educator of its indwelling ego-soul, its awakener to fuller self-consciousness. STUDENT

The Lesson of Mimicry

A FRENCH naturalist argues, from a somewhat unique standpoint, that belief in an intelligent consciousness in nature, maintained and accumulated for two or three generations, will suffice to bring about an entire change in humanity. Children who are brought up to feel that they are in the presence of, and in part the product of, an all-surrounding natural intelligence comprehensibly working behind all that they see, will feel a unity with, a sympathy with, the natural world which will make them almost new beings. And this sympathy or friendliness may open some ways of communication of which we can now hardly conceive. Theology, he thinks, still stands in the way; for its God is more and less and other than the intelligence he argues for.

A good deal of his case rests on protective mimicry, a weak creature's mimicry of some better protected one, or of its surroundings. A moth, for example, may resemble a wasp; a butterfly, a dead leaf or twig; a sapid beetle, one of very ill odor and taste; and so on, thousands of cases being now known. According to the current theory of natural selection, these resemblances—often unbelievably close—arose very gradually, the slightest variations in the required direction being accumulated little by little until perfection resulted.

But if that be the way of their origination we should be able to see it going on, see everywhere the steps of the transition. Yet there are practically no steps visible, and the past evidences none. As Professor Kellogg says:

No indubitable cases of species-forming or transforming, that is, of descent, have been observed; and no recognized case of natural selection really selecting, has been observed.

The resemblances, then, occurred suddenly as cases of leap or "mutation." Are we to suppose that the leap, so marked, so eminently useful to the creature, resulting in so photographic a mimicry, was accidental? If so, why never a leap in the opposite direction? Why did a wasp never suddenly come to resemble a moth?

Natural selection would of course have eliminated any such injurious mimicry; but if it occurred, or if sudden changes of form, of magnitude equivalent to that of mimicry occurred, we should have some sight of them before elimination had done its work. Moreover it would have no work to do if the sudden change happened to be neutral as to harm or benefit. Useless mimicry we never see, however. Is it possible to entertain any other hypothesis than intelligent design?

The argument seems perfectly valid. It does not, of course, credit the insect with having varied itself or with having decided that the next egg it laid should hatch into a new type; but with being in the hold of a deeper intelligence working consciously in the interest of evolution.

One wonders whether some people may not already, unknown to themselves, be in touch with that, and in some degree guiding it; people who can make anything grow anywhere, people whose plants vary and mutate with extraordinary facility in the directions they desire.

And one can understand something of the enriching effect on a child's mind if it comes to feel that in caring for flowers and animals it is helping this inner soul of nature. For such a child at any rate, materialism would never be possible in after life. STUDENT

Vital Rays

IT seems to be definitely established that the human brain emits a special type of rays, provisionally named by their discoverer *v-rays*. Starting from the brain they emerge from the forehead, but also run down along the nerves and may finally be detected at the finger tips. The evidence of their existence, recently furnished by Major Darget to the French Academy of Sciences, consists in their power to affect photographic plates thoroughly protected with black and red paper. If in addition there is a sheet of printed paper between the forehead and plate, and an hour's exposure is given, an impression of it, either as positive or negative, is obtained. As an exposure to the sun caused no change in the protected plate, it seemed to follow that the rays were somewhere up in the region generally labeled *x*. Whilst able to penetrate glass as well as paper, they were stopped by thin films of various metals. They appeared, however, to do some sort of work on these, for the sensitive plate bore curious markings like those of electric discharges.

The whole trend of recent research makes the existence of such emanations at any rate probable. And when the probability has become certainty, science might gracefully render a little act of homage to Reichenbach. He demonstrated such rays sixty years ago. C.

Weed Eradication

THE agricultural department of the University of Wisconsin, while conducting tests in hemp growing, found that the crop's greatest usefulness was in eradicating weeds. Some of the experimental plots were infested with quack grass, Canada thistles, wild mustard, and other deep-rooted weeds. These plots were sown with hemp, which grew to a height of ten or twelve feet; and when the crop was removed and the land broken, it was found that nearly all the weed roots had been killed. The weeds, however, had not affected the growth of the hemp. Thus the hemp can be made of double service, for, apart from its weed-killing power, it pays to grow it as a crop.

The government recommends a solution of sulphate of iron as a spray for killing weeds in grain. Applied when the weeds are young, it kills their tender foliage but does not injure the grain. It is cheaper than the copper sulphate and the proportion is 100 pounds of iron sulphate (copperas) to 50 gallons of water, which is sufficient for an acre. It is said that weeds in gardens and lawns can be attacked by the same method, but amateur experimenting is not recommended. H.

Tree Lore

TREE lore is the subject of an article in a contemporary, which gathers together instances of the veneration for trees from the ancients and from the poets in the usual chatty style, drawing no conclusions. We are reminded of Bryant's line, "The groves were God's first temples," of the Druids with their oaks, of Moses and the burning bush, and many more; and finally the tree of Eden is mentioned.

The Tree is one of those symbols of the ancient Wisdom-Religion along with which may be mentioned the Serpent, the Bird, Water, Fire, Cross, Sun, Moon, etc. When used as symbols they did not denote the natural objects to which the names are generally applied, but certain principles or powers in Nature for which we have no name. These principles were denoted by the name of that natural object which best typified them or corresponded with them. Thus Water meant the principle of fluidity or solution or fertility, which was symbolized by the actual physical fluid of that name; Fire was the spiritual life of the universe, symbolized by its physical counterpart the terrestrial flame; the Cross is the symbol for a fourfold manifestation, like terrestrial Nature with its four elements and its cubical plan of construction; and so on. In like manner the Tree is a symbol for one of these very comprehensive and profound conceptions of the ancient Wisdom-Religion.

The Tree of Life is by no means peculiar to our Bible, but is found in the Mosaic account in common with many other religious narratives.

The Symbol for Sacred and Secret Knowledge was universally in antiquity a Tree, by which a Scripture or a Record was also meant. Hence the

word Lipika, the "writers" or scribes; the "Dragons," symbols of wisdom, who guard the Trees of Knowledge; the "golden" apple Tree of the Hesperides; the "Luxuriant Trees" and vegetation of Mount Meru guarded by a Serpent. Juno giving to Jupiter, on her marriage with him, a Tree with golden fruit is another form of Eve offering Adam the apple from the Tree of Knowledge.—*The Secret Doctrine*, vol. I, pp. 128-9

The symbol of the "Tree" standing for various Initiates was almost universal. Jesus is called "the tree of Life," as also all the adepts of the good Law, while those of the *left* Path are referred to as the "withering trees."—*Ibid.*, II, p. 496

The Norse Ask, the Hesiodic Ash-Tree . . . and the *Tzite* tree of the *Popol Vuh*, out of which the Mexican *third* race of men was created, are all one. . . . The Occult reason why the Norse Yggdrasil, the Hindü Aśvattha, the Gogard, the Hellenic Tree of Life, and the Tibetan Zampun, are one with the Kabalistic Sephirothal Tree, and even with the Holy Tree made by Ahura Mazda, and the Tree of Eden—who among the western scholars can tell?—*Ibid.*, vol. II, p. 97

The Tree figures conspicuously in American mythology, and occupied a prominent position in the ceremonies and rites of the native religions. In the cosmical pictographs of the Mayas and Nahuas it stands in the center of the universe, its branches rise to the fertilizing rain-clouds, while its trunk is rooted in the vase of primeval waters from which all things took their origin. In the Mexican sacred formulas the tree was prayed to as *tota*, "Our Father." . . . Did the ancient Quichés desire offspring, they sought some spot where a tree overhung a fountain, and to it they addressed their prayers. . . . To this day the green tree . . . is an object of reverence near the native hamlets of Central America. It is the sign of life, and its honor is a survival of that of the primal tree which their ancestors adored.—Brinton, *Myths of the New World*

So there is far too much evidence to enable us to doubt that the word *tree* has been

universally used as a symbol, while the actual tree has been venerated as typical of that of which it was the symbol. The natural tree was also recognized as a living *being* or soul, whose presence enshrined and radiated certain qualities; but now-a-days our materialism confines its knowledge to a recognition of the hygienic and commercial qualities of trees. Nevertheless trees are mighty manifestations of the universal Life, whatever we may choose to call it by; and the Power which creates them, whether natural or divine, must be a great power. STUDENT

Electrical Fixation of Atmospheric Nitrogen

AN account of the *Birkeland-Eyde* process of fixing atmospheric nitrogen, and thus obtaining nitrates and nitrites for fertilizing purposes, is given in the *Scientific American Supplement*. The writer, whose name is Eyde, claims that this process has created the synthetic nitrate industry, through the discovery that the best results could be obtained by using great quantities of energy in the electric arc, instead of small quantities of energy as was formerly believed to be best. The factory works on an enormous scale, passing the air through hot arcs, collecting the nitrous gases formed, purifying and condensing them, and then neutralizing them with lime; electricity is the only power used, derived from power-stations, and no coal is burnt, the heat of the arcs being utilized for the other processes. Descriptions of the results obtained in agriculture by experimenting with this calcium nitrate are appended.

This is a veritable triumph for synthetic chemistry, in which the scientific "Mercury"—electricity—plays the wizard's part. T.

The Limitations of Space-Concepts

IN the *Scientific American* of July 3 is published the essay by Lieut. Col. Graham Denby Fitch which won the \$500 prize offered by that excellent journal. The essay is a clever résumé of the well known arguments advanced by the fourth dimensionists; but nothing further is adduced to show that they have any useful purpose, or that they throw any light upon the problems which are influencing either the collegiate or the public mind.

If we concentrate our attention upon an image of space, pure and simple, we find that it represents a *void*. The moment we imagine a point in it, we have introduced a limit, acknowledging that we can see nothing *within* the point, and in the same way we subconsciously think of a circle which bounds the space, although we do not cognize it, and try to make ourselves believe that it does not exist.

It is from the point, that all dimensions must start, and by the use of the well known three dimensions, we can then fix the position of any other point, and thus proceed to build up what we call *form*. But form is a very different thing from space. It is only a strictly limited portion of it, and when we have postulated that the point produces the line, the line the plane, and the plane the solid form, we are dealing with limitations which began with our point, no matter what form we build up. It would therefore appear that the "three dimensions" of space are only extensions of mere limitations.

Further there is no other extension which the mind can conceive of unless we imagine something which is *beyond* space and which the essayist calls "hyper space," which if it means anything at all, means space viewed from an outside standpoint.

Now it would appear that the mind of man is in just this position. It can by imagination build up every kind of form within space. It can take a triangle and turn it round until it views it edgewise. It can make a cube and expand and contract it to any extent. It can change one form to another. But it cannot see that fourth dimension which assumes, for instance, that there is a thing called a tesseract, a body resulting from the extension of the cube, so that it is bounded by cubes. If the argument is advanced that no particular form need be specially taken, it will still remain true that any space bounded by other spaces is not that which we mean when we talk of the infinite space.

All this might seem comparatively trivial and unworthy of much thought were it not that there are ideas which may possibly throw further light on the subject.

Let us return to the hypothetical *point*, from which the "three dimensions" are supposed to start. If we traverse the routes of the three dimensions in the six directions

which spring from the point, we can barely imagine going on, and on, and on, by each of these six routes, out and out, towards the boundless. But go on which route we will, we are compelled to imagine that impossible thing, an infinity which has a finite beginning, but no end.

Is there nothing within and beyond the point which we cannot see? Is it unreasonable to suppose that within the point there is something which is of the same essence as the boundless infinitudes on the outside of the elusive circle?

If we consider this along with the first conception spoken of, viz., a blank void, we may begin to suspect that perhaps we are looking at a vision which we have created, or using an instrument which is imperfect, not delicate enough, not sufficiently adapted to the circumstances to be able to perceive the truth. As a matter of fact we are face to face with the truth stated by H. P. Blavatsky, that "the mental and physical fantasy called space is a nightmare of the human imagination."

The teaching of Theosophy that the Cosmos is of a dual nature, Spiritual and Material, and that man himself partakes fully of that same dual nature, will enable us to realize the above statement. The higher mind, which is the only true man, is a part of the spiritual nature, and in considering the above question it is by its reflection functioning through the brain only. But the brain is a very imperfect instrument, and can only cognize especially the material side of things. Now the idea of extension upon which the three dimensions of space are founded is purely material. Extension is a property of matter, and not of spirit, and hence when the idea of extension is looked at in the pure abstract, as in the above case, the result is either a void or an impossibility.

It is of the utmost importance that we should have clear ideas as to the means by which we can form a right judgment on all questions which come before us for solution. As divine Souls, we have an eternity behind us, as well as before us. We did not begin at any hypothetical point to continue for an infinitude. Our life is one of continual experience or consciousness, and it is by enlarged experience or consciousness that we live and move and have our being. The experiences received through the brain-mind and the senses are illusions of matter. The experiences received through the higher mind come from the source of real being.

No one who has experienced high ideals of duty, honor, peace, strength, truth, justice, mercy, will dare to say that they occupy any *portion* of space, or that they do not exist, because he cannot see them with the brain-mind. He knows very well that these experiences are such that they are his very life, and yet that to argue about them to one who felt them not, would be a profanation.

From the fact that the soul of man is placed, as it were, for the sake of experience between the two poles of spirit and matter, he has to find a path for himself and a means of self-guidance. He does this by the higher reasoning faculty within him which gives him discrimination and ultimately wisdom. He may thus be independent of dogma or creed. Vicarious knowledge is of no use to him. In the words of St. Paul, he must "judge the spirits." He will recognize that the material

consciousness of the body, the appetites and dislikes, the inertness, the annoyances, must be overcome and replaced by the higher, more real, and eternal spiritual experiences.

And more than all, he will learn that the material illusion which separates him from his brother man must be overcome. The soul of man is *outside of our space* and is undivided in its essence. Every human soul is but a facet, a ray, of that which eternally exists and fills everything behind the illusive appearances of our bodily life, brain, and senses. The Cosmos is filled with that which is, with Eternal Life, and the more we live with the invisible experiences of the true reality, the more we shall realize the divinity of our real nature. As says the ancient Hindû scripture:

The weapon divideth it not, the fire burneth it not, the water corrupteth it not, the wind drieth it not away; for it is indivisible, inconsumable, incorruptible, and is not to be dried away; it is eternal, universal, permanent, immovable; it is invisible, inconceivable, and unalterable; therefore, knowing it to be thus, thou should'st not grieve.

Borrow's Bewilderment

THE insufficiency of Christianity when confronted by the deeper problems of life is admirably illustrated in the case of George Borrow, the heroic and sagacious agent of the British and Foreign Bible Society in Spain during the third decade of the Nineteenth century.

Borrow had been arrested and was confined in the *carcel* of Madrid in company with some of the most abandoned ruffians of the neighborhood. One murderer he met with was imprisoned with his son and accomplice, a boy of only seven years old, and Borrow was naturally impelled to wonder at the mysterious ways of Providence which had entrusted this child to the care of a villain who had already begun to train him for a life of infamy.

Borrow was a man of a vigorous cultivated mind, and yet the only result of his reflections is to produce a feeling of absolute helplessness and mental fog in the presence of this difficulty. He writes:

How dark and mysterious are the sources of what are called crime and virtue! If that infant wretch become eventually a murderer, is he to blame? Fondled by robbers, dressed as a robber, born of a robber. Is it right? Oh man, man, seek not to dive into the mystery of moral good and evil, confess thyself a worm, cast thyself on the earth and murmur with thy lips in the dust, Jesus, Jesus!

No Theosophist would regard the child of this criminal as a newly created soul placed by an over-ruling Power among such unfavorable conditions; but rather as one who in past lives had encouraged such tendencies and fostered such desires as could only find their natural development among the outcasts of society. Here the bitter harvest of the previous seedtime ripens and is reaped in tears and suffering; wisdom is slowly gained and virtue by degrees becomes instinctive in the character.

Such necessary lessons can be learned by some only in the hard school of experience. The Theosophist fails to understand in what way the situation is relieved by groveling in the dust and murmuring the name of any son of man however exalted; he prefers to stand erect and calmly face the problems of existence in the light of the two great laws of Karma and Reincarnation.

THE BATTLE OF THE WORLD

THIS warfare hath been waged and waged again,
And never moment passeth, but therein
The Wise Gods triumph o'er the foes of men,
Or else the demons win.

There is one Host of Light: time surgeth on
Through all lands and ages towards one goal.
Ho, slumberers, arise, the night is gone;
Ye are not dust but soul.

There is one Host of Darkness; all the years
Have drawn their sufferings from one fount of woe.
But now the dawn of Liberation nears;
Sing, moments, as ye go!

For now the august and shining Clans are out
Who will not brook we longer drift or dwell
But human froth and flotsam, whirled about
The black, waste tides of hell.

A thousand reckonings have them dight in arms
Innumerable, lightning-sworded; ne'er of yore
So swelled their battle-song above the alarms
Of earth and hell at war.

Now have they risen! They will not stand denied
To see fulfilled their oath and compact ta'en
When Julian fell, when bright Hypatia died,
When Joan of Arc was slain.

THEOSOPHICAL FORUM

Conducted by J. H. Fussell

Question

What reason have you for saying that the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY is "a part of a great and Universal Movement which has been active in all ages?"

Answer

We ought to take broad views of things; then such a statement as this would be readily understood. If there were less need to insist on what Theosophy is *not*, one glance at history would answer you. But humanity has brought itself to such a pitch, that if a wrong idea can be formed about matters which, for lack of examination, are not comprehended, it will surely form and cherish that foolish conception, and hold it to the exclusion of patent truth.

Theosophy is not a crank system, but in line with the eternal purposes of evolution; it is enthusiasm on the side of the angels, and the expression of a universal will towards perfection. It is not psychism, and takes little interest in seeing ghosts. It prefers an honest doubter to an unbalanced psychic or a charlatan; much prefers him, whoever may persuade you to the contrary. Nay, more; since there are high places; since there is a truth in the world, and that spiritual, uplifted, glorious, full of hope and promise; is it not a sort of blasphemy when some tawdry lie decks itself out as truth and invites men to the ruin of their lives? So much that is false and tawdry is proclaimed as Theosophy by irresponsibles, that these things must be said. Theosophy is spiritual, and an urge towards magnificent life.

There is a road from matter to spirit, and it is written that a man shall turn neither to the right hand nor to the left. Set out here from the material world, from ordinary living and conventions and indulgence; the direction to take is the purification of life. Clean out self-seeking, clean out uncleanness; cultivate the grand purpose and compassionate strength. There are many byroads, such as this of psychism; shun them, says Theosophy; for the

end of them all may be figuratively called hell; they are useless, outside the aim of evolution, slippery; and on either side of them is the bottomless pit. It cannot profit a man to follow them, in the present stage of human growth; except to his damnation. No, those words are not too strong; consider the moral and physical ruin that follows so often obviously in the train of psychism. With just these bodies and minds at our disposal, we are selfish enough, and have already brought the world to a pretty pitch and congestion of misery. Would you give a child dynamite, when it has already burnt itself out of all recognition with a harmless squib? We could not do as much good now, if we had all the psychic powers in the world, as we fail to do with simple hands and feet and hearts and minds; what we could and would do, is unexampled, titanic, monstrous, unimaginable harm.

Is not this truth plain: that the world is a great battlefield, whereon Armageddon is being fought from the beginning to the end of the ages? History of the deeds and motions of men is one long record of it; forces of upliftment and nobility on this side, forces of retardation and ruin on that. Supposing the whole life story of Napoleon were exhibited to you in all its intimate details of thought and motive and action; would you not see an archangel battling with a lord of hell, from the time he lay, a baby, in his cradle, until his fall? There was the possibility of a regenerator for Europe; there were primordial genius and the mastery of things, high ideals too, we cannot doubt: and there were the seeds of demoniac, overmastering selfishness and ambition. There must have been some moment and critical turn when the seed of his worse success was first sown; an event, probably, so small that no one would have noticed it. In sober truth, all history is made up of such moments and events; and every minute action may be, as it were, the beginning of an avalanche: the fruitage of what you are doing now may fall out over the wide world for food or poison after the passing of a century, a decade, a year or a day. It is the thoughts we nourish heedlessly in our minds, that travel forth and quicken in a thousand other minds; and increase, bearing harvests of actions, customs, destinies.

In certain of our moods, when thought makes for purification and self is set aside, we are sowing roses along the track that humanity is to travel. At other times, when self and the lower life dominate us, we strew the seed of thorns and sorrow; for humanity, by infinite littles, is always preparing its own fate and future. It would be easy to go down; heaven knows what an impulse towards selfishness and indulgence is among us; but then there is the other side perpetually struggling. No man goes to ruin morally, without some protest from a voice within him; the first taste of evil is usually at least bitter in the aftermath. All humanity is a great man; and man is a little copy of humanity. Good and evil are eternally at war: an Armageddon throughout the ages, a conflict that never is over.

Now in all warfare there are campaigns, apparent intermissions and sudden burstings into activity. So history confirms that there have been in this greatest warfare of all. The material and dark side can show you perhaps

a certain sequence and external unity; but the spiritual "bloweth where it listeth"; and the greater part of its connexions will be behind the veil. Possessing the whole, and foundationed in the indestructible, it cleaves not forcedly or of necessity to any material anchorage, such as a church; but enters and re-enters the world by gates of its own choosing, finding embodiment where it will and can. Its unity and old connexion are not a matter of names, formulae or gorgeous paraphernalia; but of what goes behind and enlivens these, intent and flaming vitality. He who was the servant and benefactor of mankind in antique China, is of one kindred with the like-minded in new America; and it is as Jesus said, when they told him that his mother and his brethren were awaiting him.

But the war is being waged always, either within or beyond the vision of men. Now it will emerge into the general consciousness, kindled there by some one of the world's spiritual heroes and leaders; and a great movement will appear, such as is the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY, or as were of old the bodies that grouped themselves around Buddha, Confucius, Jesus, Zoroaster. At such times you may say that the armies of the Gods have taken the open field with banners and music; but because in the interim you hear no war-drums and see no pennons flying, you are not to conclude that they have left the world to its fate. There will be scouts about at all times, and secret motions, and holding the enemy in check. Every event which blossoms for the world's advantage has grown up out of seed unseen. What was it wakened the grand dream in the mind of Columbus; moved Huss and Luther to their questionings; brought down Gustaf Adolf from the north? All this was the Gods' scout-work and guerilla warfare, and you will find the marks of it in every land and time.

And we too, in all the moments of our lives, take our stand on one side or the other; and no one can tell what glory may flow from the least deed of self-sacrifice, the most hidden firm opposition to the clamor of his lower man;—

The hosts of angels, and the embattled stars
And all the winged and flaming hierarchies
By whose high warfare darkness is driven back
And these worlds guarded from untimely sin—
Raised a great shout of triumph yesternorn,
And flung their phalanx irresistible
Against the legions of the nether night;
And shouting so, and singing as they came,
They brake the black battalions, and drove forth
The fiercest chaos warriors, that had stood
Enramparted unvanquished, close-assailed
Almost a thousand years; and planted fair
God's flag upon the battlements and peaks
Of a new-conquered world.

And when I asked
What fateful action, done in the front of the field,
Had brought such courage and exalted joy
And sweeping victory to the Sons of the Gods;
They told me that 'twas you, who had left undone
Some evil thing you were impelled to do. M.

THINK not that Morality is Ambulatory; that Vices in one age are not Vices in another; or that Virtues, which are under the everlasting Seal of right Reason may be Stamped by Opinion. And therefore, though vicious times invert the opinion of things, and set up a new Ethicks against Virtue, yet hold thou unto old Morality.—*Sir Thomas Browne*

THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY

FOUNDED AT NEW YORK CITY IN 1875 BY H. P. BLAVATSKY, WILLIAM Q. JUDGE AND OTHERS
REORGANIZED IN 1898 BY KATHERINE TINGLEY

Central Office Point Loma California

The Headquarters of the Society at Point Loma with the buildings and grounds, are no "Community" "Settlement" or "Colony." They form no experiment in Socialism, Communism, or anything of similar nature, but are the Central Executive Office of an international organization where the business of the same is carried on, and where the teachings of Theosophy are being demonstrated. Midway 'twixt East and West, where the rising Sun of Progress and Enlightenment shall one day stand at full meridian, the Headquarters of the Society unite the philosophic Orient with the practical West

The Power of Compassion

RECENTLY has been reported the suicide of a factory girl, who is believed to have belonged to a club of factory girls, whose members had agreed among themselves to commit suicide as the best available means of escape from their daily grind. Whether the surmise about the club is correct or not, the fact remains that such a surmise was held as being likely, and that the idea is not unprecedented. We read in the history books about the various reform measures that abolished child-labor in factories, and other forms of slavery; but we see that something besides legislation is required to reform the human heart.

We are apt to lay the blame for such a condition on the shoulders of those immediately responsible; but when we come to try to prevent them we realize that they are but part of a great system that pervades all society and of which we ourselves are links. The enormous pressure which crushes the victims is made up of a myriad imperceptible pressures all converging, just as each passenger contributes a little to the weight that kills the poor horse. The case is well illustrated by a certain accident that occurred in London some years ago. A holiday crowd was surging down the steps to a railway station, singing popular songs as they went. At the top of the steps all was thoughtless gaiety; at the bottom, where the strong gates had by mistake been left locked, people were being crushed to death. And still the crowd surged on singing. So the mass of civilized humanity are singing, while each irresponsible unit adds his unconsidered mite to the pile whose weight finally converges on the victims at the bottom.

Selfishness is the force that crushes the victim; and each of us contributes a tiny rill to the streams that converge into the torrent that overwhelms. When,

MEMBERSHIP

In the Universal Brotherhood and Theosophical Society may be either "at large" or in a local Branch. Adhesion to the principle of Universal Brotherhood is the only prerequisite to membership. The Organization represents no particular creed; it is entirely unsectarian, and includes professors of all faiths, only exacting from each member that large toleration of the beliefs of others which he desires them to exhibit towards his own.

Applications for membership in a Branch should be addressed to the local Director; for membership "at large" to G. de Purucker, Membership Secretary, International Theosophical Headquarters, Point Loma, California.

TO THE MEMORY OF RALPH WYTHEBOURNE

A TRUE THEOSOPHIST

WHO DIED IN THE PERFORMANCE OF DUTY AUGUST 29, 1905

therefore, we hear of horrors in our midst or on the wave-front of "civilization" in distant lands, let us modify our righteous indignation by reflecting on our share in the guilt; but let us not modify our compassion, for that is needed to nerve our heart to resolve. Compassion; not the feeble emotion, rather of self-pity for our own throes than of real pity for the victims, sufficient, perhaps to set us talking and writing to the papers or contributing a little of our money to a society for the suppression of the abuse; until, realizing the futility of our efforts, we lapse back into forgetfulness. Compassion is what results in action. And it "begins at home." Right this next moment may occur an opportunity to offer up selfishness on the altar of compassion. If we let it slip, then we are not fit for the larger work to which we have so presumptuously aspired.

But so far from discouraging the efforts of societies and movements for the suppression of abuses, let us endeavor to strengthen their hands by pointing out some of the reasons why they do not meet with greater success. Does it ever occur to would-be reformers that a mere casual impulse to do good to humanity is not necessarily sufficient reason why they should forthwith be accepted by the world as worthy champions of compassion and justice? Has it ever struck them that their life's record may possibly not show a sufficient balance on the side of righteousness and moral force to equip them as triumphant warriors in the cause of right? Does the mere fact of having an emotion of horror, accompanied with a vague desire to do good, qualify them to stand forth before the world and cry "Halt!"? Can we step out from a life of careless self-indulgence and pose as champions of mercy and justice, and expect the world to hear and obey?

Thus the reason why we are not

more successful may be that our motives are not sufficiently deep and sincere. But let us not desist; let us make them more sincere. It will surely comfort those whose hearts ache over the wrongs suffered by others to know in what way their efforts can best be applied towards alleviating those sufferings. Let them know, then, that by beginning at the beginning—"at home"—they can set foot forthwith on a path of opportunity that will radiate out from that starting-point in ever-widening ways, until they become such a power for good that their single efforts will count for more than the agitation of thousands. This is a sacred Truth. It is a great *Occult Mystery*. One of the *greatest practical secrets of Occultism* is how to use the present place and the present moment rightly, how to begin at the small beginning.

Occultism is the great Science; it teaches us how to use our highest powers in the service of Justice and Mercy; it is often called the Heart Doctrine. The power that inspires an Occultist is Divine Compassion. With this power burning in his heart and illuminating his mind, he vows an eternal vow of battle against the demon selfishness; and he challenges the vow in the field wherein it challenges him—in the field of his own character. He sees that it is this demon that unnerves his hand and strikes him with impotence, so that his voice is not heard in the world. He realizes that he can never hope to defeat this foe in the larger sphere of the world if he quail before it when it confronts him in his own sanctum.

Therefore our compassion over these horrors is a call to duty. Let us reflect well how much of our feelings are mere emotions and to what extent our motives are tinged with the desire to soothe our own breast and relieve our own conscience. Having eliminated these selfish emotions, let us preserve the real spirit that compels to action, and resolve to set foot upon the *beginning* of the path. Shall we still add our weight to the load? Shall we go on sending out selfish thoughts and moods to swell the torrent of cruelty?

But let us not be deterred by the destructive doubt that our own individual efforts can count for naught. If they have not counted, it is only because we have never tried in the right way. It is an Occult Law that right

thoughts and deeds and aspirations are like grains of mustard seed and will grow into a mighty tree. Soon we shall become the life-center of a spreading forest of branches.

You who speak of your *love* for the widow and orphan—is this love of yours an ornament that you wear before men or a nectar on which you feed your private soul? If that is all you mean by "love," I will agree that it is hardly worth fighting for. But there is a love that is worth fighting for; there is a love that men *will* fight for—not because it

The Tercentenary of the Astronomical Telescope

IT is exactly three hundred years ago that Galileo Galilei, perhaps the greatest scientific martyr to theological ignorance and bigotry, made the first efficient astronomical telescope of which we have positive knowledge. It was a very small and crude instrument, but it allowed Galileo to see the moons of Jupiter, the mountains on the moon, the sunspots, the rings of Saturn (though not clearly enough to make out their nature), and the crescent shape of Venus; which set at rest the arguments against the Copernican system.

Galileo was the inventor of the astronomical telescope. It may have been known to the most learned among the ancients; there are traditions that some kind of spy-glass was used in the great lighthouse of Alexandria, the Pharos, and that Nero had one; certainly a lens has been found in the ruins of Nineveh. Roger Bacon, who died about 1294, after having predicted so many modern inventions, had undoubtedly arrived at the theoretical proof of the possibility of making both the telescope and the microscope. Giambattista da Porta in Italy and Leonard Digges in England are known to have had practical knowledge of the principles of refraction of light, before Galileo's time, but the honor of bringing forward the first telescope to the attention of the world must be given to Hans Lippershay, a spectacle maker of Middleburg, who offered three primitive instruments to the States of Holland in October, 1608.

Lippershay's perspective glasses were very feeble, mere toys in fact, but they attracted wide interest, and when Galileo heard the rumor of their success he instantly set himself to solve the problem of making a satisfactory instrument with which to examine the wonders of the heavens. He shortly had an instrument which magnified eight diameters, and finally he succeeded in making one of thirty-three diameters, the result of extraordinary patience and skill. It was impossible for him to exceed this power, because the form adopted by him, of a convex object-glass and concave eye-piece, produced colored fringes round everything, which increase and become unsupportable under high powers. The Galilean principle survives in the modern opera-glass, for it is a convenient method of getting an

Lomaland Photo. and Engraving Dept.

is right to do so, but just because they *will*. If this love should be born in your heart, you would need no guide to point out your duty, no mathematical calculus to settle the mixed relations of conscience and convenience. For the light of compassion burning in the heart unscales the eyes, and man becomes a Seer, like the Masters of Compassion who have pointed out the way. So let us have no hypocrisy. Either get rid of your uncomfortable emotions or else transform them into deeds. Let the world's cry feed your silent resolve: You can rise from the plane of helplessness—one of the crowd—to a higher level whereon your very thoughts will shine as from a hill-top and your individuality will become a calculable power in the world. STUDENT

upright image, but of course later inventions have practically eliminated the color-fringes even under fairly high powers.

It was hoped that science would have been able to celebrate the tercentenary of Galileo's telescope by the construction of the largest implement of astronomical research ever made — the 100-inch object-glass for the Mt. Hamilton Observatory, California — but unfortunately the giant lens has defects which render it useless. The difficulties of making glass disks of the colossal size required seem almost unsurmountable. The greatest telescope lenses in use today are those of the Lick and the Yerkes Observatories, 36 and 40 inches in diameter respectively; both of these are in the United States, but there are several others here and abroad which closely approach them in size and power.

The reflecting telescope, in which a concave mirror takes the place of the object-glass, was not known to Galileo. Sir Isaac Newton, who was born the same year that Galileo died, 1642, made the first reflector. Sir William Herschel, at the end of the eighteenth century carried the reflector to a high state of perfection. He made all his discoveries by means of reflectors of his own making, the largest being 4 feet in diameter and 40 feet long. There are several reflectors of great size in use today, but their usefulness is not in proportion to their magnitude when compared with the refractor. They have the advantage of comparative cheapness, though, and it seems probable that the next advance in telescope building may be on the remarkably ingenious plan now being worked out by Mr. R. W. Wood of the Johns Hopkins Observatory, who has made a reflecting telescope mirror of quicksilver, which takes the required concave form upon being rotated rapidly. If the ripples which arise upon the surface can be eliminated there seems a good possibility of getting a huge reflector of 10 or 20 feet diameter at reasonable cost.

The primitive Dutch telescopes were introduced into England almost immediately after their invention, and Thomas Harriot, explorer, astronomer, and mathematician, a friend of Sir Walter Raleigh, and the most distinguished English scientist of his day, procured a couple and made a number himself. These early spy-glasses were called "cylinders" or "trunks," and Harriot succeeded in making one that magnified fifty times. He is credited with the independent discovery of the sunspots.

What thrilling sensations these early pioneers in the noblest of the physical sciences must have felt as the strange and unexpected wonders of the heavens first presented themselves to their astonished gaze! What would they have thought if they could have lifted the veil of the future and seen the blazing glories of the illimitable fields of clustered stars, the soft, mysterious streamers of the spiral nebulae, the spectrum of the sun, or the magical beauty of Saturn, as shown by the powerful instruments of our day! STUDENT

The Church's Tribute to Science

A CORRESPONDENT to the *New York Evening Post* (last December) writes to point out how the churches are coming round to the views of Thomas Paine, and in illustration quotes two tributes to science, one from Paine and the other from Dr.

Aked in *Appleton's Magazine*. Said Paine:

But some perhaps will say: "Are we to have no Word of God—no revelations?" I answer, Yes, there is a Word of God; there is a revelation. The Word of God is the creation we behold; and it is in this Word, which no human invention can counterfeit or alter, that God speaketh universally to man. . . . It is in the creation that all our ideas and conceptions of a Word of God can unite. The Creation speaketh a universal language, independently of human speech or human language, multiplied and various as they may be. It is an ever-existing original, which every man can read. It cannot be forged; it cannot be counterfeited; it cannot be lost; it cannot be altered; it cannot be suppressed. It does not depend upon the will of man whether it shall be published or not; it publisheth itself from one end of the earth to the other. It preaches to all nations and to all worlds; and this Word of God reveals to men all that is necessary for man to know of God.

And Dr. Aked says the following true and noble words:

We have passed from signs and wonders to law in the heavens, from the prince of the powers of the air to meteorology, from magic to chemistry and physics, from miracles to medicine, from fetish to hygiene! And to whom do we owe it? Absolutely and without exception we owe it to the nature searchers whom it is the fashion of little men in little pulpits and in stodgy religious papers in this country to decry. They have asked questions of nature. They have pressed for replies. They have seen their contemporaries now silenced by fear, now lulled by content. Some have ventured so far as the threshold of the unknown, have stood doubting, fearing, then turned back rather than lift the veil boldly and face the light. And others have been satisfied to abide in the known and the safe and the near, not so much as caring to inquire whether there was life and light beyond the narrow circumference of their world. These inquisitive souls have asked questions of earth, air, and sea. They have taken up the challenge of the Almighty to Job in the immortal drama; they have entered into the springs of the sea and walked in the recesses of the deep. If the "gates of death" have not yet been revealed to them, yet have they comprehended the breadth of the earth.

Thus this courageous minister of the church recognizes the supreme services of a power outside the churches, a power whose achievements have depended on the fact of its dissociation from theology and orthodox religion, a power which has often been bitterly at variance with ecclesiasticism on essential points. This admission takes down ecclesiasticism from its place of supremacy and makes it at best a partner of science on equal terms. Future claims by the churches are discounted by this confession of past error. Too often we find ecclesiasticism trying to keep up with the procession and lead it at one and the same time.

But though Nature is a book of knowledge, that book will remain sealed for those who cannot read it. And can science, if endowed only with bodily senses and the instrumental aids thereto, fathom the vital secrets? Neither can the physical eye discern nor the untrained mind comprehend these mysteries. Vision presupposes Seers. Should it not, then, be the function of religion to purify and sublimate our carnal nature, that the cataract of selfishness drop from our eyes and we see as do the Masters?

How to attain Divine Wisdom and Perfection is surely the path which religion ought to point out. Can the churches persuade science to make spiritual truths a kindred object of its quest? If so, they will be worthy coadjutors, and Nature's book of wisdom can be

read through and not merely skimmed and misinterpreted to the discredit of religion.

Religion and Science are one and ought never to have been separated. Knowledge is sacred; sanctity is wise. If piety is associated with ignorance, it is because the ideal of piety is in fault. And if the quest of knowledge be dissociated from the motive of Duty, the knowledge attained will be no true knowledge and will bring woe to mankind. H. T. E.

Mexico

ACCORDING to a recent book on Mexico, which is reviewed in the *New York Sun*, the ancient inhabitants of that land have preserved their identity to a far greater degree than in most other Latin-American countries; and the resulting nation is likely to play a very important part in history. Whether this is due to the peculiar character of the Aztecs, or to the topography, or to fortunate conditions of government, or to a combination of circumstances, is matter for debate. The various Indian races are still to a large extent distinct from each other and from the pure white Mexicans; and in Oaxaca alone there are at least fifteen perfectly distinguishable tribes of pure Indians, of which two comprise more than half the population. In Mexico, unlike other countries of similar ethnologic composition, the Indian population does not tend to decrease.

The Mexican character is summed up as that of a people in the making; at the beginning, not at the end, of their civilization; not decadent but evolving. The average Mexican knows more about the chief men of his native land and about its history and institutions than do the average Briton or American about their countries.

The thought sometimes strikes one that Americans and a few European nations discuss "world-problems" among themselves without sufficient regard for the existence of other important members of the family of races, whose lines of thought and ways of regarding life differ considerably. We may discuss our own problems in religion, economics, or literature; but to regard them as world-problems is a mistake, and perhaps they do not count for so much, in the way of indications of the future, as we may suppose. Europe and the United States are not the world; Latin America and Asia are both pulling rapidly to the fore.

BRITISH-CALIFORNIAN STUDENT

Thoroughness and Enthusiasm

FRANCE has given more valuable lessons to the world in many ways than almost any other modern nation. She has shown again and again that the most intense enthusiasm can go hand in hand with the utmost practical thoroughness in achievement. Real enthusiasm is intensely practical. In engineering alone the French have proved this repeatedly. They were the pioneers in the construction of reinforced concrete, submarines, and automobiles, and it is due to their enthusiasm that the recent conquest of the English Channel by an aeroplane, and even the achievements of the Wright brothers are due, for the aeromotor is the outcome of French perseverance with automobiles. The publications of French engineering societies show a scientific thoroughness unapproached by those of any other country. Why? Enthusiasm! STUDENT
